Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Highlights

November estimate of production of principal field crops, Canada, 2008

• The final crop report for 2008 revealed that Prairie farmers harvested a record 12.5 million tonnes of canola and a record 3.6 million tonnes of dry field peas. In eastern Canada, soybean production rose considerably with a record 600,000 tonnes of soybeans harvested in Quebec.

Analysis

November estimate of production of principal field crops, Canada, 2008

The final crop report for 2008 revealed that Prairie farmers harvested a record 12.5 million tonnes of canola and a record 3.6 million tonnes of dry field peas. In eastern Canada, soybean production rose considerably with a record 600,000 tonnes of soybeans harvested in Quebec.

Growing and harvest conditions are always variable across Western Canada, but reports indicate that the fall harvest was slightly ahead of time and crop quality was above average. Cool and wet conditions held back the harvest in early fall, but little frost damage and improved conditions allowed progress to end up slightly ahead of normal. Year end crop yields were mainly up from interim estimates with highest ever yields recorded for spring wheat, barley, canola and oats.

Canola production easily a record

Prairie canola production rose to 12.5 million tonnes, up 32.8% from 2007. The previous record for canola was 9.4 million tonnes grown in 2007. The production increase was the result of record yields and harvested areas.

In the Prairie provinces where 99% of canola is grown, farmers reported record production in each province. Harvested area was a record in all three provinces, and record yields were reported in Manitoba and Saskatchewan.

Dry field peas a record

Prairie farmers harvested a record amount of field peas. The production of field peas, used primarily as animal feed reached 3.6 million tonnes, up 21.7% from 2.9 million tonnes in 2007. Robust yield and record harvest area combined to produce this record.

Production in Manitoba, Saskatchewan and Alberta all rose. Production in Saskatchewan was a record 2.7 million tonnes, and production in Alberta was a record 731,400 tonnes.

More soybeans in the East

Total soybean production rose 23.7% to 3.3 million tonnes, just short of the record production of 3.5 million tonnes produced in 2006. Production increased in both Quebec and Ontario where over 90% of soybeans are grown.

Production in Quebec rose 27.1% to a record 600,000 tonnes, an amount easily greater than the previous high of 535,000 tonnes set in 2006. The production increase is the result of a rise in harvested area to a record 565,900 acres, up 30.5% from 2007.

Soybean production in Ontario rose by 476,300 tonnes to 2.5 million tonnes, up 23.8% from 2007, the result of a 10.4 bushel per acre increase in yield to a near record 43.4 bushels per acre.

^{1.} Commercial stocks include condominium stocks as of December 2003.

Animal feed, waste and dockage calculated residually.
 Wheat in-transit at July 31, 2003 adjusted down by the Canadian Grain Commission to correct an historical anomaly in reported visible stocks.

^{1.} Commercial stocks include condominium stocks as of December 2003.

^{2.} Grain exports exclude seed.

^{3.} Animal feed, waste and dockage calculated residually.

^{4.} Some durum wheat is blended with other wheats and exported as wheat excluding durum.

^{5.} May include small amount of use by food plants.

Table 5-3 Supply and disposition of grains in Canada — Wheat, excluding durum

^{1.} Commercial stocks include condominium stocks as of December 2003.

Grain exports include seed.
 Animal feed, waste and dockage calculated residually.

^{1.} Commercial stocks include condominium stocks as of December 2003.

Grain exports exclude seed. Grain imports include seed.
 Animal feed, waste and dockage calculated residually.

^{1.} Grain exports exclude seed. Grain imports include seed.

Ethanol included in industrial use.
 Animal feed, waste and dockage calculated residually.

Table 5-11 Supply and disposition of grains in Canada — Corn, other provinces

^{1.} Grain exports and imports include seed.

Concepts and definitions

Definitions of the crop categories referenced in Report No. 8, Field Crop Reporting Series are listed below.

Major field crops: wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

Coarse grains: oats, barley, rye, corn for grain and mixed grains.

Oilseeds: canola, flaxseed and soybeans.

Major special crops: dry field peas, lentils, mustard seed, Canary seed and sunflower seed.

Fodder corn and hay

We are now asking respondents to report the percentage moisture of their harvested fodder corn and hay for silage. Estimates of production for fodder corn in this publication are calculated using a standard percentage moisture content of 70%. Production of total hay is reported at a standard dry matter content of 90%.

Methodology and data quality

Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the November crop production estimates is selected.

The target population for the November crop production estimates includes all farms in Canada enumerated in the Census of Agriculture except those on Indian reserves and farms from the Northwest Territories and Yukon. Institutional farms are also excluded from the target population.

Probability surveys can use two types of sampling frames; list and area. In the November Crop Production Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 29,900 farms is drawn from the list frame for the November Crop Production Survey.

Data collection

Data collection for the November Crop Production Survey was carried out from October 24 to November 17, 2008.

Data collection for field crop surveys is undertaken using the Computer assisted telephone interview (CATI) system.

Edit and imputation

With the introduction of the CATI system, it is now possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

Response rate

Usually by the end of the collection period, 85% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 6%. The remainder of the sample unaccounted for, can be explained by non-contact. Initial sample weights are adjusted (a process called raising factor adjustment) in cases of total and partial non-response.

Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis and consultation with provincial statisticians, before a final estimate is published.

Revised production estimate

The November crop production estimates contained in this publication are final for the crop year. Revisions to the crop estimates may still be made for up to two years after the end of the crop year.

The following table contains some statistics which indicate the magnitude and direction of the updates between the November Crop Production Survey and final crop estimates. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of the update is indicated by counting the number of years that the preliminary estimate is above or below the final published estimate.

The data indicate, for example, that the estimates of the November production for barley are changed by a magnitude of, on average, 2.5% and usually in a downwards direction.

Text table 1
Magnitude and direction of changes between November and final production estimates, Canada 1998 to 2007

Crop	Number of years preliminary farms production data are amended:						
	Average change	Upwards	Downwards				
	percent	number					
Wheat	2.5	3	8				
Oats	3.3	3	6				
Barley	2.5	2	8				
Flaxseed	3.0	2	5				
Canola	2.3	6	4				
Corn for grain	1.3	6	3				
Dry peas	4.5	1	8				
Soybeans	0.5	4	4				
•							

Data quality

The November crop production estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the coefficient of variation (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations would be less than twice the coefficient of variation. This range of values is referred to as the confidence interval. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates do remain within the confidence interval of the survey level indicators. For the November Crop Production Survey, c.v.'s at the Canada level range from 1% to 5% for the major crops.

For the different types of special crops, the estimates contained in this publication have been assigned a letter to indicate their c.v. (expressed as a percentage). The letter grades represent the following c.v. ranges:

Text table 2 Coefficient variation rating system for special crops

Coefficient variation range	Symbol	Meaning
0.00% to 4.99% 5.00% to 9.99% 10.00% to 14.99% 15.00% to 24.99%	A B C D	Excellent Very good Good Use with caution
25.00% and more	F	Too unreliable to publish

Data confidentiality

Data confidentiality is ensured under the Statistics Act, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

Field crop reporting series calendar

Catalogue 22-002-XWE

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 hrs, Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: agriculture@statcan.gc.ca

Report no. and title	2009 Release Dates

Cereals and oilseeds review

Catalogue 22-007-XWE

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.

Supply and disposition tables

Catalogue 22C0001XEE

Statistics Canada produces national supply-disposition tables for the major grains for the periods August to December; August to March; and August to July. Data include production, farm and commercial stocks, imports, exports, human food and industrial use and feeding. Five years of data are provided. The tables are normally available after major data releases (farm stocks, production, export revisions). Provincial farm supply and disposition tables are also provided on request. The supply-disposition tables are available on paper or by e-mail.

For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: agriculture@statcan.gc.ca
