## Information to access the product

This product, Catalogue no. 22-003-X, is available for free in electronic format. To obtain a single issue, visit our website at www.statcan.ca and select "Publications."

## Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, the Agency has developed standards of service which its employees observe in serving its clients. To obtain a copy of these service standards, please contact Statistics Canada toll free at 1-800-263-1136. The service standards are also published on www.statcan.ca under "About us" > "Providing services to Canadians."

## Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

## Symbols

The following standard symbols are used in Statistics Canada publications:
not available for any reference period
not available for a specific reference period
not applicable
0 true zero or a value rounded to zero
$0^{\text {s }}$ value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
$p$ preliminary
revised
x suppressed to meet the confidentiality
requirements of the Statistics Act
E use with caution
F too unreliable to be published

The following staff members have contributed to this publication:

Serge DesRoches, Michele Lapointe, Hwan Lee, Sheba Mirza, Jake Purdy, Mardi Smith and Leah St. Michael.

## Highlights

## 2007 Fruit and Vegetable Survey

According to results from the Fruit and Vegetable Survey conducted in autumn 2007, Canada's fruit and vegetable farmers sold almost $\$ 1.4$ billion worth of produce in 2007. This represented a value comparable to the sales realized in 2006.

The fresh market accounted for two-thirds of the fruit and vegetable sales. Fruit sales to processors last year declined by $\$ 49$ million from 2006, mainly the result of lower yields in low bush (wild) blueberry production.

Total vegetable sales in 2007 amounted to $\$ 673$ million, down $2.6 \%$ from 2006. However, they were still $11.0 \%$ higher than the previous five-year average (2002 to 2006). Total fruit sales fell $3.9 \%$ to $\$ 689$ million. However, they were still $23.8 \%$ above the previous five-year average.

The most valuable fruit crop was blueberries, worth an estimated $\$ 189$ million. The most valuable vegetable crop was tomatoes, worth about $\$ 82$ million.

Farmers dedicated an estimated 114,457 hectares to vegetables last year, while the bearing area amounted to 108,506 hectares. Slightly more than half of the bearing area for vegetables was used for the fresh market. Vegetables with the largest cultivated areas included sweet corn, peas, beans, carrots, and dry onions.

Sweet corn represented about one-quarter of the total area. However, the area dedicated to sweet corn has been declining since 1997.
Farmers had an estimated 105,634 hectares in fruit in 2007, with blueberries accounting for half this area. Acreages for apples, pears, plums and prunes declined in 2007, while blueberries and cranberries increased in 2007 over 2006. The growth in blueberries and cranberries may be due partly to an increased demand for these two antioxidant-rich fruits by a health-conscious public.

The decline in total fruit sales was attributable to a $25.7 \%$ drop in yields of low bush blueberries. Sales of low bush blueberries to the processing market fell $32.0 \%$. On the other hand, the biggest increase in sales (+63.3\%) occurred in the high bush blueberry process market.

## The provinces: British Columbia, Ontario and Quebec account for vast majority of fruit sales

Farmers in just three provinces accounted for $86.6 \%$ of all fruit sales in 2007. Those in British Columbia represented $35.6 \%$, followed by Ontario (31.7\%) and Québec (19.3\%).

Vegetable sales were concentrated in Ontario (42.7\%) and Québec (37.9\%). Combined, they accounted for $80.6 \%$ of the Canadian total.
British Columbia growers sold fruit worth an estimated $\$ 245$ million in 2007, up $10.7 \%$ from 2006. The gain was due to a $36 \%$ surge in sales of high bush blueberries, which in turn was due to a $45.4 \%$ increase in total area. High bush blueberries accounted for $37.7 \%$ of total fruit sales in British Columbia.

At the same time, British Columbia's apple area continued to decline and since 2002, the loss was more than 1,800 hectares which represented a drop of $31.0 \%$. Production of grapes used for wine slipped $2.6 \%$ due to poor weather.

In Ontario, farmers sold $\$ 219$ million of fruit last year a situation comparable to 2006. The total was well above the previous five-year average of $\$ 172$ million. The increase was due to a $20.6 \%$ gain in apple sales.

Ontario farmers also sold an estimated $\$ 287$ million in vegetables in 2007, down from $\$ 293$ million in 2006 . However, the 2007 figure remained above the previous five-year average of $\$ 263$ million. Tomatoes accounted for one-quarter ( $25.7 \%$ ) of all vegetable sales, the highest proportion, followed by sweet corn (8.9\%).

In Quebec, farmers recorded total fruit sales estimated at $\$ 133$ million, down $29 \%$ from 2006. Winter and spring frosts contributed to lower yields which resulted in a $51.7 \%$ decline in low bush blueberry production in Quebec. In 2007, low bush blueberries dropped to second place in terms of sales behind apples. Apple sales remained almost unchanged at $\$ 34.5$ million.

Quebec farmers reported vegetable sales of $\$ 255$ million in 2007, down from $\$ 257$ million in 2006. The main crops in terms of sales were lettuce, carrots, dry onions, sweet corn and cabbage.

## Intercensal revisions

Data from the 2006 Census of Agriculture were released on May 16, 2007. As a result, estimates of fruit and vegetable area and production in the publication Fruit and Vegetable Production will be revised, where necessary, to align with those from the census. The revisions will be announced in the publication's June 2008 issue.

## Methodology and data quality

## Introduction

Throughout the publication, data in some instances have been updated based on more recent information from differing data sources. Revisions have been made to some 2006 commercial production estimates. The contents of this publication represent the most recent information available at the time of printing on selected fruits and vegetables produced in Canada. All data are prepared in consultation with representatives of Federal and Provincial Departments of Agriculture and I' Institut de la Statistique du Québec. Current year data are preliminary and will be revised in subsequent publications and on CANSIM.

Current year area, production and value figures are preliminary while historical data are estimated based on more complete market information. Data are generally concerned with total production and take into account wastage, etc. With the availability of market and wastage information the estimates more closely reflect commercial production.

Data shown in this publication are on a crop year basis. In the case of mushrooms and greenhouse tomatoes and cucumbers, however, the data are on a calendar year basis. All value data are those obtained at the "farm gate" and are concerned with returns to growers. Estimates are provided in both imperial and metric units.

Production and value data are provided for the twelve most commercially significant fruits grown in Canada. The production figures for fruit crops refer to marketed production rather than harvested production. Only vegetable crops grown commercially are included: no data are available for fruits and vegetables grown for home consumption.

## Survey methodology

The major source of information in this publication is the Fall Fruit and Vegetable Survey, conducted by Statistics Canada. This survey is a sample survey for which the data are collected by phone. The survey estimates the area planted, area harvested, production and farm gate value for the principal fruit and vegetable crops. For fruit, bearing area is estimated as a subset of the cultivated area and is a sum of the fresh market and processing areas. Areas for the fresh market and for processing are also estimated for all fruit and vegetable crops.

Together with import price data collected by Agriculture and Agr-Food Canada, the survey estimates are used to initiate requests for tariff protection under "Snapback" provisions of the Canada-United States Trade Agreement (CUSTA).

## Survey frame

Relative to the Fall survey of Fruit and Vegetables, the frame includes all Canadian horticultural farms, with the exception of farms producing only mushrooms, potatoes or greenhouse vegetables. These are already covered by other surveys collecting the desired information.

This exclusion is taken into account by the estimation process. The known population of fruit and vegetable farms is 14,500 . For the purpose of the sample selection, the survey frame was stratified by province and, within each province, by land area. The farms were homogeneously grouped according to different fruit and vegetable areas in each province.

## Sample selection

For the Fall Survey of Fruit and Vegetables, a sub-sample of 9,626 farms was selected from the farms which reported fruit or vegetable areas during the Spring Survey of Fruit and Vegetables. In order to reduce response burden, small farms having only two acres or less in vegetables were excluded from the sampling process. This exclusion is taken into account by the estimation process. The known population of fruit and vegetable farms is 11,413 . For the purpose of the sample selection, the survey frame was stratified by province and, within each province, by land area. The farms were homogeneously grouped according to different fruit and vegetable areas in each province.

## Data collection

The Fall Survey of Fruit and Vegetables collects information by phone. Statistics Canada conducted the survey in November and December of 2007 using computer-assisted telephone interviews (CATI).

## Response rates

Information was received from $92.8 \%$ of the sample. Non-responding units (i.e. no-contacts and refusals) are dealt with by adjusting the initial sample weights. The assumption that the non-responding units are randomly distributed among the sample is used to justify adjusting the initial sample weights.

## Edit and imputation

It is possible to implement edit procedures at the time of the interview with the introduction of the CATI methodology. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. For the Fall Survey of Fruit and Vegetables, imputation was used to adjust for incomplete survey answers to the questions of production and farm gate value. The imputation used a trend analysis of the completed questionnaires to generate averages to be used to impute for the missing values.

## Sampling and non-sampling errors

The statistics from the Fall Survey of Fruit and Vegetables are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. For the other surveys, there are only non-sampling errors since no sample is selected.

Sampling errors arise because estimates are derived from sample data and not the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that, sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Population coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

## Estimation

Relative to the Fall Survey of Fruit and Vegetables, the survey data collected are weighted within each stratum in order to produce estimates representative of the population. Weighted historical information is used to take into account small farms being excluded from sampling. Analyses of the top contributors and historical comparisons as well as consultations with the Provincial Departments of Agriculture are performed before a final estimate is published.

## Data quality

The estimates from the Fall Survey of Fruit and Vegetables are based on a probability sample of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the coefficient of variation (CV).

Over repeated surveys, 95 times out of 100 , the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations with respect to the sample estimates would be less than twice the coefficient of variation. For the 2007 survey, CV's at the Canada level range from 1.1\% to $24.5 \%$. We obtained CV's around $10 \%$ at the province level. Less commonly reported variables are associated with higher, but still acceptable CV's, usually fewer than $20 \%$. Coefficients of variation values for the published data are available upon request and are not included in this publication due to space limitations.

## Revision policy

Data for the previous year are presented as final while data for the current year are considered preliminary. Data are presented initially in the June issue of Fruit and Vegetable Production (Catalogue no. 22-003-X) and are revised further in the February issue of the publication.

## Conversion factors

In some cases data that are received by Statistics Canada are in different units of measurement from those which appear in the publication. The fruit estimates are converted at the following rates:

1 bushel of apples = 42 pounds;
1 quart of strawberries or raspberries $=1.25$ pounds;
1 bushel of all other tree fruits $=50$ pounds (net weight).

Corn, lettuce and greenhouse cucumber production estimates are converted at the following rates:
1 dozen ears of corn = 6 pounds;
1 dozen heads of lettuce = 15 pounds;
1 dozen greenhouse cucumbers $=13$ pounds.

The following metric conversion factors are used in this publication:

```
Area 1 acre = 0.4047 hectare;
Production 1 ton short (2,000 pounds) = 0.9072 tonne;
    1 pound = 0.4536 kg.
```

## Other sources of information

## British Columbia Ministry of Agriculture, Fisheries and Food

The Horticulture Branch provides estimates of fruit and vegetable acreage, production and value, several times a year, as more complete information becomes available.

Ontario Ministry of Agriculture, Food and Rural Affairs
Conducts several surveys and provides Statistics Canada with data for both vegetables and fruits, through their publication "Seasonal Fruit and Vegetable Report".

Institut de la statistique du Québec
Conducts several surveys and provides Statistics Canada with data for both vegetables and fruits.

Greenhouse
Data on the Greenhouse industry is obtained from annual surveys conducted by Statistics Canada.
