To access this product

This product, Catalogue no. 57-202-X, is available free in electronic format. To obtain a single issue, visit our website at www.statcan.ca and select "Publications" > "Free Internet publications."

Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, Statistics Canada has developed *standards of service* that its employees observe. To obtain a copy of these service standards, please contact Statistics Canada toll-free at 1-800-263-1136. The service standards are also published on *www.statcan.ca* under "About us" > "Providing services to Canadians."

Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the Statistics Act
- E use with caution
- F too unreliable to be published

Metric Measures

```
TW.h. (terawatt-hour) = Watt-hour x 10^{12}
```

GW.h. (gigawatt-hour) = Watt-hour x 109

MW.h. (megawatt-hour) = Watt-hour x 10^6

KW.h. (kilowatt-hour) = Watt-hour x 10^3

Highlights

In 2006, coal accounted for 77% of all the fuels consumed to generate electricity in Canada and 36% of the cost of these fuels. Conversely, natural gas accounted for 13% of all fuels consumed in 2006 but 47% of the cost of fuels used.

Alberta (45.5%), Ontario (25.8%), and Saskatchewan (15.0%) were the three largest users of fuels for the production of electricity in Canada in 2006.

Overall, Alberta used 51% of all coal and 42% of all the natural gas consumed in Canada for the production of electricity, while Ontario consumed 24% and 32% respectively and Saskatchewan consumed 18% and 10% respectively.

In 2006, Quebec was again the largest producer of electric power in Canada generating 30.4% of all of Canada's electric power and 49.9% of all hydro-electric power. Quebec used only 1.2% of total fuels consumed for other forms of electricity production.

Electricity generated by wind increased again in 2006, up 44.3% 2,466 GW.h from 1,709 GW.h in 2005. This represents 0.4% of the total electricity generated in Canada in 2006, up from the 0.3% in 2005.

Analysis

Electricity Generation

In 2006, net electricity generation (total generation less energy used in generating station service) decreased 2.1% to 592 008 GW.h. Of the total electricity generated, 549 272 GW.h was for use in Canada, a decrease of 2.1% from 2005. The remaining 42 736 GW.h was exported, a decrease of 1.8% from the previous year.

Hydro is the main source (59%) of electricity generation in Canada. Hydro stations produced 349 469 GW.h, down 2.5% from 2005. Generation from nuclear sources increased 6.4% from 2005 to 92 419 GW.h. Production from conventional steam plants decreased by 9.3% to 118 252 GW.h.

Domestic demand for electricity (including self-generated electricity) decreased 1.3% to 572 896 GW.h in 2006. Residential use decreased to 148 631 GW.h from 150 986 GW.h in 2006. Industrial use decreased 1.7% to 234 695 GW.h.

Sales

Total domestic sales of electricity to ultimate customers decreased 2.1% in 2006 to 477 507 GW.h. Revenue received from sales totalled \$34,524 million, up 0.4% from 2005.

Revenues per kilowatt-hour for residential and agricultural sales for 2006 are 8.81 cents, up 5.9% from 2005. Revenues range from 6.23 cents per kilowatt-hour in Manitoba to 35.18 cents per kilowatt-hour in the Northwest Territories and Nunavut.

Financial Data

Operating revenues of electric utilities decreased 4.7% in 2006 to \$51,621 million. Operating expenses decreased 2.8% to \$41,154 million. Electric utilities registered a net income of \$5,756 million in 2006, down 1.9% from 2005.

Total assets stood at \$176,603 million, up 3.5% from a year earlier. Long term debt is 44.0 per cent of total assets, up from 42.7% in 2005.

There were 76,566 persons employed by electric utilities in 2006, an increase of 0.1% from the previous year. Wages and salaries increased 14.0% for a total wage bill of \$6,516 million in 2006. Publicly operated utilities reported total wages and salaries of \$5,705 million, while private utilities reported \$811 million.

Cost of fuels

While generation by electric utility thermal plants decreased 2.5%, their expenditures on fuel decreased 8.1% in 2006 to \$4,155 million. Decreased in thermal generation led to a 2.1% decrease in expenditures on natural gas to \$1,956 million. The amount spent on petroleum products decreased 41.6% to \$429 million. Expenditures on coal decreased 2.5% to \$1,497 million. The average delivered efficiency of thermal plants is 30.4%.

It should be noted that the values presented above have been taken from Table 6. They may differ from values appearing in Table 8 due to collection period differences, accounting procedures (e.g. royalties paid on coal production are included in Table 6 but shown as a separate item on Table 8) and fuel usage (e.g. production of steam for sale).

Generating Capacity

Total generating capacity in Canada at the end of 2006 reached 123 792 MW, an increase of 1.5% from the 2005 level of 122 021 MW. In 2006, utilities' generating capacity totalled 115 832 MW, while industry reported 7 960 MW. New stations totalled 1 896 MW in 2006.

Notes

- Table 3 has undergone two major changes since 1986.
- The first of these involves the amount of energy received by industrial generators from utilities. In past year all receipts were recorded, but starting in 1986 only those receipts necessary to fulfil outside commitments are shown. Consequently, the line "Used by producers" has been greatly reduced as it represents only that energy "used" from own production. This reduction is balanced by an equal increase in utility sales to mining and manufacturing. Table 10 is not affected.
- (b) The consumption categories employed in this publication do not equate with the rate structures of the utilities.Respondents have been requested to classify their customers according to these consumption categories. Because of the ongoing nature of the task of upgrading the accuracy of this classification, there may be a certain lack of uniformity in these statistical series through time.
- 2. In Table 7, beginning in 1996, the current portion of a sinking fund is now reported as an asset, while the sinking fund is reported as part of long-term debt. This change in financial reporting was recommended by the Canadian Institute of Chartered Accountants.
- In Table 3 and in Table 8, receipts and deliveries from the Power Pool of Alberta are treated as sales and 3. purchases. Some companies only report the net transaction of their generation and distribution arms in their annual reports.
- On April 1, 2000, the NunavutTerritory was created from the eastern part of the Northwest Territories. The 4. western part kept the name Northwest Territories. A breakdown of the various tables between Nunavut and the Northwest Territories for 2000 is available free upon request.

Methodology and data quality

This publication presents annual commodity and operating statistics on the electric utility industry in Canada (code 2211 of the North American Industrial Classification System, catalogue number 12-501-XPE). For completeness, the report also provides data on industrial establishments with generating facilities.

Statistics on the supply and disposition of electric energy are compiled from an annual survey of all power producers in Canada (approximately 340 producers). The response rate for this survey is very high. As a consequence, minimal imputation is required and minimal bias resulting from non-response is introduced in these data. Exports and imports information are obtained from the National Energy Board.

Financial and operating statistics are compiled from an annual survey of major electric utilities in Canada. The response rate for this survey is very high. As a consequence, minimal imputation is required and minimal bias resulting from non-response is introduced in these data.

Installed generating capacity data are obtained from an annual survey of electric utilities and industrial establishments which have at least one plant with total generating capacity of over 500 KW. The survey covers some 1100 generating stations.

Data published in this report are subject to a certain degree of error, be it in differences in the interpretation of the questions, or mistakes introduced during processing. Reasonable efforts are made to ensure these errors are kept within acceptable limits through careful questionnaire design, liaison with major respondents, editing of data for inconsistencies and subsequent follow-up and quality control of manual processing operations.

Appendix I

Glossary of terms

Capability: The maximum that a station or equipment is capable of carrying under specific conditions.

Capacity: In the electric power industry, capacity has two meanings:

- 1. **System Capacity:**The maximum power capability of a system. For example, a utility system might have a rated capacity of 5,000 megawatts, or might sell 50 megawatts of capacity (i.e. of power).
- 2. **Equipment Capacity:** The maximum power capability of a piece of equipment. For example, a generating unit might have a rated capacity of 50 megawatts.

Cogeneration: The combined production of electricity and useful heat. Cogeneration is often employed at industrial plants where the heat produced can be utilized in the manufacturing processes and for general space heating.

Conventional generation: Electricity that is produced at a generating station where the prime movers are driven by gases or steam produced by burning fossil fuels.

Electric utility: An organization that, as its prime purpose, generates, transmits and/or distributes electric energy for sale.

Firm energy or power: Electrical energy or power intended to be available at all times during the period of the agreement of its sale.

Grid: A network of electric power lines and connections.

Hydroelectric power: The production of electricity from the kinetic energy of falling water.

Installed capacity: The capacity measured at the output terminals of all generating units in a station, without deducting station service requirements.

Interruptible energy or power: Energy or power made available under an agreement that permits curtailment or interruption of delivery at the option of the supplier.

Kilowatt (KW): The commercial unit of electric power; 1000 watts. A kilowatt can best be visualized as the total amount of power needed to light ten 100-watt light bulbs.

Kilowatt-hour (KW.h): The commercial unit of electric energy; 1000 watt hours. A kilowatt hour can best be visualized as the amount of electricity consumed by ten 100-watt light bulbs burning for an hour. One kilowatt hour is equal to 3.6 million joules.

Load factor: The ratio of the average load during a designed period to the peak or maximum load in that same period. (Usually expressed in per cent.)

Load: The amount of electric power or energy consumed by a particular customer or group of customers.

Megawatt (MW): A unit of bulk power; 1,000 kilowatts.

Megawatt-hour (MW.h): A unit of bulk energy; 1,000 kilowatt hours.

Nuclear Power: Electricity generated at an electric power plant whose turbines are driven by steam generation in a reactor by heat from the fission of nuclear fuel.

Peak Demand: The maximum power demand registered by a customer or a group of customers or a system in a stated period of time such as a month or a year. The value may be the maximum instantaneous load or more,

usually the average load over a designated interval of time, such as one hour, and is normally stated in kilowatts or in megawatts.

Reserve generating capacity: The extra generating capacity required on any power system over and above the expected peak load. Such a reserve is required mainly for two reasons: (1) in case of an unexpected breakdown of generating equipment; (2) in case the actual peak load is higher than forecast.

Winter peak: The highest load on a power system during the six-month period October to March. The winter peak almost always occurs in January or early February.
