CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for more than 60 years.

Together with other housing stakeholders, we help ensure that Canada maintains one of the best housing systems in the world. We are committed to helping Canadians access a wide choice of quality, affordable homes, while making vibrant, healthy communities and cities a reality across the country.

For more information, visit our website at **www.cmhc.ca**

You can also reach us by phone at 1-800-668-2642
or by fax at 1-800-245-9274.

Outside Canada call 613-748-2003 or fax to 613-748-2016.

Canada Mortgage and Housing Corporation supports the Government of Canada policy on access to information for people with disabilities. If you wish to obtain this publication in alternative formats, call 1-800-668-2642.

CURRENT HOUSING RESEARCH

Volume 15
Number 2
Winter 2008-2009

Issued also in French under the title: ***Recherches courantes sur l'habitation***

Publié aussi en français sous le titre: ***Recherches courantes sur l'habitation***

INTRODUCTION

Under Part IX of the National Housing Act, the Government of Canada provides funds to Canada Mortgage and Housing Corporation to conduct research into the social, economic and technical aspects of housing and related fields.

Current Housing Research is compiled and produced two times a year by the Canadian Housing Information Centre. This publication provides information and access to research which is undertaken and sponsored by the Corporation. It is also available on CMHC's web site at http://www.cmhc-schl.gc.ca/en/corp/li/horetore/horetore_004.cfm

The publication contains information on completed research reports, new publications, videos and bibliographies, as well as planned and ongoing research projects. An alphabetical title index of items listed is included at the end for quick reference.

The overall arrangement of "*Current Housing Research*" is by broad subject category. Within each subject category, lists of planned and ongoing projects and completed research reports are described.

Each entry can contain the following elements:

- The project or report title;
- A description of the project or report results;
- The CMHC Project Officer who is managing the project;
- The Division within CMHC which is responsible for the project;
- For External Research Projects, the grant recipient undertaking the research;
- A Contract Identification Number (CIDN);

- The Status of the project: whether the project is in a planned, ongoing or completed phase. "Planned Projects" are those that are not yet underway, but are likely to be initiated in the current year. "Ongoing Projects" refer to research projects which are currently underway. No reports are yet available. Once the project is completed, and a report is available for distribution, it will be listed as a "Completed Report."

- Whether the report resulting from the research project is available and the address where the completed report can be obtained.

To discuss research projects that are recent or ongoing, please call CMHC General Inquiries at (613) 748-2000 and ask for the CMHC Project Officer identified under each project description.

ACQUIRING THE PUBLICATIONS AND REPORTS CITED AS COMPLETED

The availability section of each completed entry indicates the contact to obtain the item and whether the item can also be found on the Internet. Most items are available from the Canadian Housing Information Centre and can be ordered by using the information on the order form on the next page. We accept orders by regular mail, fax, phone, and via the Internet.

A number of the items cited are available electronically and the URL is included in the listing. CMHC uses an FTP (File Transfer Protocol) server to distribute reports. FTP has been used on the Internet as a means of transferring files between servers and users for many years and it continues to enjoy very wide use today.

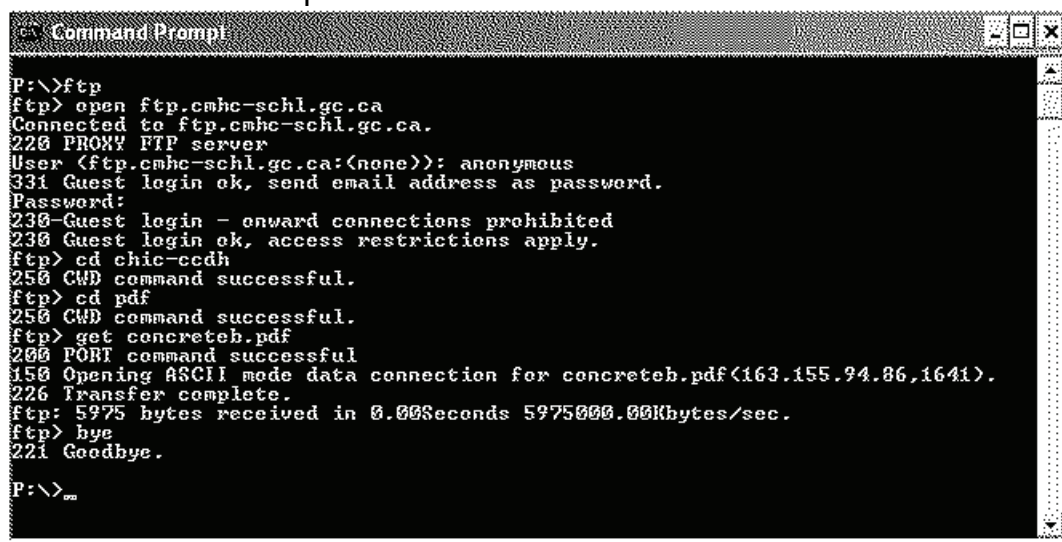

In order to access a file using FTP, software with FTP capabilities is required and there are 3 types of FTP software:

1. Command Line FTP - FTP commands can be entered from a Command line or "DOS Prompt" on all Windows PCs.
2. FTP Client - a purpose built application to connect to FTP servers. These are widely available as commercial products or as shareware or even freeware on the Internet.
3. Some (not all) web browsers - Internet Explorer and Netscape can be used to access FTP files. They use correct protocol when ftp:// is entered in the address bar of the browser.

Example: **ftp://ftp.cmhc-schl.gc.ca/**

Here is an example of using the command line to retrieve a file from FTP.

FTP commands and help are available on PCs

CMHC S EXTERNAL RESEARCH PROGRAM

The objective of the CMHC External Research Program (ERP) is to encourage and enable researchers in the private and non-profit sectors to put forward and carry out relevant, innovative, and high quality housing research projects. Under the Program, financial contributions are made annually to support research investigations into important questions, problems, and issues affecting Canadian housing. CMHC is interested in receiving applications on topics related to existing CMHC housing research.

Applicants to the External Research Program must be Canadian citizens or have permanent resident status in Canada.

Independent researchers as well as those employed in Canadian universities, institutions, private consulting firms, the professions and the housing industry may apply for these grants.

Full-time students at the graduate or under-graduate level are not eligible to apply. Students may be hired to assist in conducting the research, but under no circumstances may they take over responsibility for the direction of the work or the quality of the final report.

Individuals who are full-time federal, provincial or municipal government employees may apply. However, to be eligible, an applicant must apply as a private consultant, and the proposed research must not be part of, or interfere with his/her regular work. CMHC employees are not eligible to receive grants under this Program.

To obtain the Guidelines and Application Form (product #62964):

- visit our Web site at <http://www.cmhc-schl.gc.ca>;
- e-mail: erp@cmhc-schl.gc.ca; or
- call 1 800 668-2642.

TECHNICAL RESEARCH

BASEMENT WALL INSULATION RETROFIT MONITORING

There have been field observations and research findings in the last several years which suggest that polyethylene as a vapour barrier in many wall assemblies may be overkill, and that other vapour retarder systems may be preferable. The last CMHC research showed that the below-grade portion of interior insulated basement wall assemblies might benefit from more permeability, not less. Various interior insulated assemblies have been suggested as alternatives. This project will measure the moisture performance of different basement interior insulation wall assemblies in 10 real houses to see if the research findings can be substantiated in the field, and to look out for unexpected repercussions in changing the current wall construction practice.

FROST PROTECTED FOUNDATION MONITORING PERFORMANCE FOR RESIDENTIAL USES IN NORTHERN QUÉBEC, CHISASIBI PILOT PROJECT

This external research project will monitor the performance of a frost protected shallow foundation in a harsh northern Quebec climate setting. The project will provide in-situ measured data on the performance of this type of residential foundation. Results will be analysed to evaluate potential improvements to insulation levels and placement and will provide guidance for builders and designers. This project should be completed by January 2009.

GUIDE TO FIXING YOUR DAMP BASEMENT

Appropriate for homeowners and home inspectors alike, this publication helps diagnose a prevalent problem in housing: damp basements. Damp basements can lead to the development of indoor mold, provoking allergies and other health problems. "A Guide to Fixing Your Damp Basement" provides a quick method for diagnosing moisture problems, and identifying and deciding on the solutions to deal with these problems. The "Guide" assists in diagnosing the problems, provides options for solving these problems, and helps decide on the plan of action required.

Revised edition. Ottawa: Canada Mortgage and Housing Corporation, 2008. v, 71 pages

BASEMENTS, FOUNDATIONS & CRAWLSPACES

RETROFITTING CRAWL SPACES - FIRST NATIONS DEMONSTRATION

The project will involve the retrofitting of several wet crawl spaces. The retrofits will be well-documented (e.g. video) and monitored for a period afterwards to verify effectiveness. The case studies will be used to demonstrate how to fix poorly performing crawl spaces. One demonstration may show inexpensive ways to lift existing houses and retrofit a better crawl space or basement underneath. Other possibilities include crawl space floor regrading, the use of exhaust fans to isolate problem crawl spaces, external utility buildings instead of basements, etc. The project has been prepared in conjunction with First Nations housing authorities and responds to a pressing problem found on many reserves. Completion is expected in 2009.

BUILDING CODES

COMPLYING WITH RESIDENTIAL VENTILATION REQUIREMENTS IN THE 2005 NATIONAL BUILDING CODE

The objective of this project was to update the existing CMHC publication, "Complying with Residential Ventilation Requirements in the 1995 National Building Code (NBC)" to reflect the ventilation requirement changes which are included in the 2005 NBC. This publication will provide builders and renovators with an illustrated explanation to describe and clarify what ventilation options can be used to comply with the 2005 National Building Code. A consultant revised the text to incorporate results from recent research and improved house construction techniques. A group of home builders reviewed the text and illustrations were redrawn. The document is complete, but conflicting code requirements discovered during the research must be reconciled prior to publication. CMHC has attempted to resolve some of these conflicts with code officials before issuing the publication, but has made no significant progress. CMHC is now waiting on rulings by NBC officials so that appropriate changes can be made prior to publishing.

REWRITING TEST STANDARD CAN/CGSB-149.10 - DETERMINATION OF THE AIRTIGHTNESS OF BUILDING ENVELOPES BY THE FAN DEPRESSURIZATION METHOD

The airtightness standard used for testing houses dates back to 1986. The object of this project is to re-write CAN/CGSB-149.10, incorporating some updates and some alternative techniques. There have been no meetings up until now but there has been extensive consultation by e-mail and document review. Progress has been delayed due to the lack of consensus by committee members. A new draft of the document is available, but some technical and terminology questions have yet to be resolved.

BUILDING MATERIALS

COMPRESSED EARTHBLOCK (CEB) - STRAWBALE HYBRID BUILDING SYSTEM

This project will investigate the performance of straw bale insulation in combination with compressed earth blocks, as a hybrid building system. Earth blocks are found in many other parts of the world, but their use in Canadian buildings, so far, has been limited. The researcher will be monitoring energy use as well as some of the performance characteristics of the earth blocks. The project has been initiated. The earthblocks have been cast and construction is starting. Because of the wet summer in 2008, 5% cement was added to the mixture for stabilization.

Samples of the earthblocks will be tested at Queen's University for compression and bending, and the results compared to other CMHC earth block tests (Dupuy) and more standard construction material such as bricks and concrete masonry. The energy usage of the structure will be recorded through the winter to determine the envelope efficiency of the hybrid structure. Both moisture performance and the extent of cracking will also be monitored for the year following construction.

EFFECT OF MESH AND BALE ORIENTATION ON THE STRENGTH OF STRAW BALE WALLS

The objective of this research was to obtain data on the structural performance of straw bale construction to aid prospective home-owners, builders, building inspectors, and engineers. Structural testing of full-scale straw bale walls was carried out in the Structures Lab of the Department of Civil Engineering at Queen's University, Kingston. Test walls were constructed and subjected to compressive loading until failure. The stiffness and strength of each wall was measured, allowing a comparison to be made between various combinations of reinforcement, bale orientation, and plasters. In order to make this research as relevant as possible to the stakeholders, Chris Magwood, a builder and consultant on dozens of straw bale projects in Ontario, was actively involved in defining the most relevant parameter combinations and constructing the wall panels. The Ontario Straw Bale Building Coalition (OSBBC) and other Canadian sources have been consulted.

Prepared by P.I. Colin MacDougall, Department of Civil Engineering, Queen's University. Co-investigators: Chris Magwood, Steve Vardy. CMHC Project Officer: Don Fugler. Ottawa: Canada Mortgage and Housing Corporation, 2008. (External Research Program Research Report) 61 pages (4032 KB)

GYPSUM WALLBOARD CORE STRUCTURE AND EFFECTS ON END USE PERFORMANCE

Gypsum wallboards are used as an interior finishing surface in many Canadian houses. The core structure of gypsum wallboard contributes to the board's end use, fire resistant properties and fastening strength. Commercial boards have core structures which may differ greatly. This research study, funded under CMHC's External Research Program and undertaken by Innogyps Inc., produced laboratory gypsum board samples made from various industry representative chemical foaming agents, produced at various foam densities in order to generate an array of different gypsum core structures to be evaluated. These samples were investigated for 2 major performance parameters; (a) fire resistance (as measured by shrinkage resistance and surface cracking when exposed to high temperatures) and (b) fastening performance (as measured by nail pull testing). In general, it was determined that various core structures at relatively consistent board weights were able to be produced using a lab-scale continuous foam generation system. Average void sizes ranged from 275-750um (as determined by CT scanning). There was no observable affect of core structure on volumetric shrinkage or surface cracking resistance when samples were subjected to 1000 C firing temperatures. Nail pull measurements showed a degree of scatter of results that did not absolutely correlate core structure to nail pull performance but did highlight some potentially strong performing samples.

TEMPERATURE AND MOISTURE CONDITION OF WOOD STRUCTURAL MEMBERS EMBEDDED IN INTERIOR INSULATED SOLID MASONRY WALLS, MONITORING OF THE GROSH BUILDING, STRATFORD, ONTARIO

Two projects were launched to monitor the temperature and moisture content of wood structural members (joists) embedded in interior insulated solid masonry walls. Houses with solid masonry walls in Kincardine, Ontario, and Wolsely, Saskatchewan that were retrofitted with interior insulation were fitted with the necessary instrumentation to monitor the moisture and temperature regimes in wood joists embedded in the masonry walls. Based on the limited monitoring conducted in the two houses, the long-term durability of the wooden members does not appear to be adversely affected by the installation of the interior insulation systems. However, there was one exception. In the Kincardine House, joist ends embedded in the stone foundation wall experienced ever increasing moisture content after the installation of the interior insulation (spray applied poly urethane foam). It was suspected that moisture wicking up the foundation wall became trapped and this raised the moisture content of the monitored wood joist end. When the insulation was removed from around the joist, the joist began to dry. This finding supports the general observation that interior insulation retrofits of solid masonry structures should only be considered if moisture issues are first addressed.

BUILDING MATERIALS

UPDATING CMHC'S "BUILDING MATERIALS FOR THE ENVIRONMENTALLY HYPERSENSITIVE"

This project revised CMHC's publication "Building Materials for the Environmentally Hypersensitive". The revision added new information about products listed in the publication together with new products that were not commonly used for residential construction in 1993 when the document was first published. Products that are no longer manufactured were deleted. Results from emissions testing of materials were added. The document will be published in 2009.

CONSUMER INFORMATION

CREATION OF CONTENT FOR "ABOUT YOUR APARTMENT" FACT SHEETS

This project builds on the success of CMHC's About Your House series by providing consumer level information for the residents of multi-unit residential buildings. Key topics ranging from resolving indoor air quality, water penetration, occupant comfort, saving energy and water, through to security and safety are being covered. Much of the material is being developed from existing CMHC research and publications. The information will be organized into fact sheets that consumers and property owner-managers can use to solve problems in their buildings. The first 10 publications will be completed by December 2008.

DOORS AND WINDOWS

BEST PRACTICE GUIDE - WINDOWS

In partnership with Natural Resources Canada and the Homeowner Protection Office, CMHC developed this comprehensive and practical technical advisory document for architects, engineers, builders, renovators, window manufacturers, window installers and others involved in the design, specification, construction, installation and interfacing of windows within the exterior wall assembly in both low-rise and high-rise residential construction. This document provides guidance in selecting the appropriate window performance criteria for the intended application and provides installation details to ensure the performance criteria is achieved through the effective continuity of thermal, air, vapour and moisture barriers at the interface between the window units and the wall assembly. The project has been completed and the document is currently being translated and formatted for publication. The Best Practice Guide will be available by the end of 2008.

EVALUATING THE EFFECTIVENESS OF WALL-WINDOW INTERFACE DETAILS TO MANAGE RAINWATER

Based on the need for effective window-wall interface details to manage water intrusion, CMHC is developing a Best Practices Guide for Window Installation that will be applicable to both low-rise wood frame construction and high-rise buildings. To support the development of the Guide, and the needs of the fenestration, wall cladding and flashing industry, CMHC in partnership with the National Research Council (NRC), formed a consortium of interested North American organizations to evaluate specific window-wall interface details to determine how effective the details are in managing rainwater. CMHC and NRC funded the first phase of this multi-year study. The Phase 1 testing program, highlighting wall-window interface details of interest to CMHC, is finished; the final report is expected to be released by winter of 2008. The Phase 2 testing program, funded by industry partners, was completed in the winter of 2007. The final Phase 2 report is expected to be completed by December 2008.

THERMAL PERFORMANCE OF WINDOW ASSEMBLIES

CMHC in collaboration with the National Research Council, is undertaking a study to investigate the risk of condensation at the window frame perimeter of the interface assembly as a function of both temperature differential and air leakage rate across the assembly. Depending on the types of windows used and the cladding into which the windows are installed there arise different methods to provide drainage that may also affect air leakage through the assembly. This, in turn, may give rise to the formation of condensation along the window, at the sill or along the window sash and glazing panels. Various window installations, including position of the window unit within the wall assembly and different window-wall interface insulating strategies will be subjected to temperature, air pressure differentials and various air leakage rates and paths to investigate the risk to condensation they impose on the window-wall assembly. The project commenced in the summer of 2008. The testing program is expected to be completed by spring 2009 and the report made available by the summer of 2009.

WINDOW INSTALLATION COURSE - DEVELOPMENT AND DELIVERY

The objective of this project will be to develop a 'Window Installation' course. The course will be directed at those trades, or trades-persons, responsible for the installation of windows. The course will cover window installation in both low-rise and high-rise construction assemblies. The course will introduce to the installer the fundamentals in building science concepts required to integrate window and envelope performance criteria including airtightness, water-management and thermal performance (condensation resistance). The development of the course material is expected to commence in the fall of 2008. Completion of the project is expected by the spring 2009.

AIR LEAKAGE CONTROL DEMONSTRATION PROJECT IN MULTI-UNIT RESIDENTIAL BUILDINGS

This research project will assess the individual and collective impact of air sealing measures on building envelope air leakage characteristics, building energy consumption, indoor air quality and occupant comfort in multi-unit residential buildings. Air sealing products and measures will be documented for common air leakage points. The predictive capabilities of existing air leakage models will be assessed by comparing their estimates of annual energy savings with that actually achieved in practice. Currently one air leakage control project is underway. Two other projects have since been discontinued at the request of the property management due to other repair/maintenance and capital replacement priorities. The remaining project is in Saskatoon, Saskatchewan and the air leakage control work has been completed. The assessment of the costs is underway and the impact of the air leakage control measures on energy consumption will be estimated based on energy metering over the next year. This project will be completed by 2008.

AIR LEAKAGE CONTROL MANUAL FOR EXISTING MULTI-UNIT RESIDENTIAL BUILDINGS

This manual provides guidance to air leakage control (ALC) contractors on how to reduce air leakage in existing high-rise multi-unit residential buildings (MURBs). The objective of the manual is to assist ALC contractors to understand where, how and why MURBs leak so that they can prepare ALC plans that will reduce air leakage.

This Manual provides information on air barrier systems in building envelopes, instructions on how to diagnose air leakage and seal leaks based on currently available materials and technologies. It provides guidance on air sealing measures to reduce air leakage, reduce building energy consumption, improve indoor air quality and occupant comfort in multi-unit residential buildings. Air sealing products and measures are detailed for common air leakage points.

APPROACHING NET ZERO ENERGY IN EXISTING HOUSING

This research project explored the technical feasibility of reducing the energy consumption of existing houses to net zero on an annual basis. The project characterized the energy consumption patterns in existing housing and compiled energy efficiency and energy generation measures. Through this work, the potential for energy reduction, energy storage and renewable energy generation was assessed. The project also considered the trade-offs in comfort, cost, and

ENERGY CONSERVATION

convenience necessary to attain very low energy consumption in existing housing. This is conceptual research as the possibility of creating a net-zero-energy house from an existing dwelling is extremely challenging.

The research showed that some houses (e.g. bungalows) and some locations (e.g. Vancouver) had a far better chance of achieving net zero energy usage due to their inherent advantages. Most of the modelled houses were able to attain very low heating energy requirements. The compensating energy production, through solar thermal and photovoltaics, is often limited in effectiveness by roof size and orientation, as well as by high capital costs. The report provides a good background on what is possible for older houses and at what cost. It also provides interesting information on potential wall assemblies for these houses and decision trees on which energy retrofits to select for specific houses.

ASSESSMENT OF RENEWAL OPPORTUNITIES FOR MULTI-UNIT RESIDENTIAL BUILDINGS

Canadian cities, in particular Toronto, have an extensive inventory of post-war high-rise housing. These multi-unit residential buildings (MURBS) have envelopes and services that are nearing the end of their useful lives. Owners of these buildings will soon have to make decisions for renewal and this implies they will require assistance from designers and building science specialists. This research will provide a comprehensive review of MURB typologies and the development of integrated over-cladding solutions along with associated cost benefit studies that enable improvements in energy efficiency.

CHARACTERIZATION OF ENERGY AND WATER END-USE LOAD PROFILES IN HOUSING: LITERATURE REVIEW

CMHC, in cooperation with Natural Resources Canada, conducted a literature review of energy and water end-use load profiles, interior heat gain, monitoring and analysis methodologies in residential buildings. The project identified what data is available on energy and water end uses, research projects, data, monitoring protocols and published information relating to energy and water load profiles of housing. The study concluded that consistent, accurate and detailed load profiling data is not available for all end-uses in dwellings, particularly multi-unit residential buildings. The results of the load profiling literature search will be made available in a CMHC research highlight by December 2008.

DESIGN SURVEY OF LOW ENVIRONMENTAL IMPACT HOUSING

This research project will provide a documentation of the best existing examples of low environmental impact housing forms (including net zero energy) to date in Canada and internationally in similar climates. The goal is to eventually establish criteria and specifications for zero environmental impact housing in Canada, develop best practice models towards achieving this goal, and ultimately demonstrate these "deep green" housing models for Canadian climatic regions. Case studies of this series will be published on the CMHC web site.

DEVELOPMENT OF AN ENERGY MANAGEMENT PILOT PROGRAM FOR SOCIAL HOUSING IN ONTARIO

CMHC is participating in the development of an Energy Management Program and pilot project for social housing. CMHC will be working with the Social Housing Services Corporation of Ontario to develop an Energy Management Program that will provide local social housing providers with the tools needed to evaluate and implement energy and water efficiency measures in their buildings. CMHC support will be used to develop or adopt tools for the Energy Management Program including utility tracking and on-line energy/water audit facilities, standard energy audits, and communication documents for property owners, managers and residents. CMHC will also participate in the evaluation of energy and water efficiency projects in 20 buildings selected to participate in a pilot project to evaluate the costs and benefits of the Energy Management Program. CMHC support will be useful to establish the Program in Ontario and will also provide other provinces with useful information on the development of central energy programs for their social housing stock as well.

DOCUMENTATION OF AN ENERGY MANAGEMENT PLAN FOR SOCIAL HOUSING

CMHC is preparing a report to describe an Energy Management Plan developed for Social Housing Providers. The report will document the organizational structure, processes, tools, documents, financing strategies, reporting, and quality assurance of the program. The final report will be delivered to all provincial and territorial housing agencies so that they may become informed of the Ontario program and to provide them with the opportunity to engage the plan, or any of its individual components, within their own jurisdictions.

ENERGY EFFECT OF SUNLIGHT CONTROL IN APARTMENT BUILDINGS

This External Research Program project will evaluate the impact of various sunlight control strategies on comfort conditions and energy use in multi-unit residential buildings. Sunlight control is important to prevent overheating which can lead to higher air conditioning costs and occupant comfort problems. Sunlight control is also required to allow for full use of solar gains to offset space heating and lighting loads. The control strategies will be assessed using computer models that can predict indoor conditions and energy loading with different architectural features such as awnings, sun shelves, lintel arrangements and other shading strategies. The final report will generate design guidelines for the control and optimization of sunlight for multi-unit residential buildings.

ENERGY EFFICIENCY AND RETROFIT IMPLICATIONS OF BUILDING RECOMMISSIONING SURVEY

CMHC, in cooperation with Natural Resources Canada, conducted a literature survey of the availability of recommissioning guidelines and other "tune-up" procedures for multi-unit residential buildings. The survey found that there was no single source of published information for enhancing the performance of multi-unit residential buildings via low and no-cost measures. Information was found to be available for individual measures to improve space heating, domestic hot water, lighting and appliances, building envelope and ventilation systems. Given the absence of recommissioning or tune-up guidelines for multi-unit residential buildings but the availability of information for discrete building systems from a wide variety of sources, the project concluded that CMHC should initiate a subsequent project to compile the measures into a single Tune-Up Guide for Multi-Unit Residential buildings. The project is complete. A Research Highlight detailing the findings of the literature search will be published in 2008.

ENERGY CONSERVATION

ENERGY EFFICIENCY CASE STUDIES OF MULTI-UNIT RESIDENTIAL BUILDINGS

CMHC is in the process of documenting the application of energy efficiency measures in both new and existing multi-unit residential buildings to be used as case studies. A compendium of case studies will be made available from CMHC. The case studies will also support the Energy Efficiency Opportunities Manual for Multi-Unit Residential Buildings that CMHC has developed. The case studies completed include: 1. Conservation Co-op, Ottawa; 2. Energy Efficiency Retrofit of the Broadview Apartment Building, Toronto; 3. Almon Street CBIP Building; and 4. Apartment Building Retrofit, Bay Street, Toronto. Ongoing projects include: 1. Performance of an Apartment Building equipped with a Water Loop Heat Pump System; 2. Grandin Green CBIP Building; and 3. Energy and Thermal Performance of an ICF Apartment Building. The case studies will be published as a part of the CMHC Better Building Series starting July 2005 and will be issued periodically as they are completed.

EVALUATING THE EFFECT OF ENERGY-RELATED BUILDING ENVELOPE RETROFIT STRATEGIES FOR HOUSING ON THE WETTING AND DRYING POTENTIAL OF THE WALL ASSEMBLY

This joint research project by NRC-IRC, NRCan and CMHC will assess the impact of two common exterior insulation retrofit strategies on the hygrothermal performance of the retrofitted wall assemblies, compared with the performance of a conventional 2 x 6 stud wall. The project will be based on full-scale wall testing in actual climate conditions as well as computer modelling. This work will assess the risks associated with interstitial condensation due to the insulation retrofits. The project has begun and should be complete in 2009.

REGULATORY AND ORGANIZATIONAL REQUIREMENTS FOR PRIVATE DISTRICT ENERGY SYSTEMS

A research project is underway to assess the regulatory and organizational requirements of non-public utilities that provide service to multi-unit residential buildings. The project will identify issues regarding utility ownership and operation that must be addressed, governing regulations, and potential ownership-client arrangements. The project will provide guidance to private firms, housing providers, developers and condominium corporations that may be considering the generation of heat and power for sale to individual apartments or entire buildings within a community. This project is a part of a larger program of work being conducted in cooperation with Natural Resources Canada to assess the opportunities for ground source heat pumps in district energy systems. Ownership and regulatory issues represent a challenge to those other than established public utilities who would like to provide energy services, from ground sources, renewables as well as conventional technologies, to individual or clusters of multi-unit residential buildings. The project will be completed by December 2008.

ENERGY CONSERVATION

STRATEGIES FOR ALTERNATIVE ENERGY USE AND REDISTRIBUTION AT THE BUILDING ENVELOPE

As part of a three year Panel on Energy Research and Development (PERD) initiative, integrated consultant teams explored the potential strategies to reduce, generate or recover and redistribute energy at the building envelope of multi-unit residential buildings for Prairie, Vancouver, Toronto and Halifax locations. The teams include expertise in building management, and development, as well as architectural, engineering and energy simulation. Each team developed recommendations for the strategies most feasible in their study areas. In Montreal a charrette led by NRCan explored sustainable strategies for a mixed-use project which includes retrofit and new commercial and residential development. The findings of the Prairie team have been used to develop strategies for a housing development in Regina.

STUDY OF ENERGY CONSERVATION OPPORTUNITIES IN THE RETROFIT OF BUILDING ENVELOPES IN LARGE MULTI-UNIT HIGH-RISE RESIDENTIAL BUILDINGS

Many buildings in the Lower Mainland of British Columbia have undergone comprehensive rehabilitation to remedy moisture-related problems. Little or no attention was specifically directed at energy conservation or greenhouse gas emissions. CMHC, the Homeowner Protection Office, City of Vancouver, BC Hydro and Terasen Gas provided funding for this research project to review and assess the effects of building enclosure improvements on the space conditioning energy use in typical high-rise residential buildings in the Lower Mainland of BC and then to develop better strategies that take into account enclosure repairs, energy conservation and greenhouse gas emissions. This project will focus on the initial data collection and analysis of the energy consumption data for both rehabilitated and non-rehabilitated high-rise buildings. The project is expected to be completed by spring 2009.

SUPPORT FOR IEA ANNEX 39: HIGH PERFORMANCE THERMAL INSULATION SYSTEMS

The International Energy Agency (IEA) has launched an R&D program to research high performance thermal insulation systems for buildings. The project will focus on vacuum insulation panels that can achieve, in theory, an insulating value of R75 per inch. Vacuum panels represent an order of magnitude improvement over conventional insulating materials, thus the energy saving potential for both new and existing buildings is enormous. Plans are being developed to organize and run a demonstration project using vacuum panels in order to assess their application and performance in buildings. CMHC will be supporting Canada's contribution to the IEA project, led by NRC's Institute for Research in Construction, and will be able to disseminate the results to the housing industry. Canada has also been asked to participate in the development of an international standard for vacuum insulating panels as a part of the IEA effort. The project is currently underway and will be completed by December 2008.

FIRES & FIRE PREVENTION

EVALUATION OF COMPRESSED AIR FOAM SPRINKLERS

Automatic fire sprinklers that use large quantities of water to suppress fires are often unsuitable in remote and northern communities, when the water supply is scarce. The project will modify existing compressed air foam (CAF) sprinkler technology developed by NRC for institutional and commercial use, for single- and multi-family housing. Under the direction of Dr. Andrew Kim at NRC, the project will demonstrate compressed air/foam sprinklers which require a fraction of the amount of water used by conventional sprinklers, in a residential application suitable for use in northern and remote communities. A prototype will be tested in a controlled fire in a vacant house. The project should be complete by the spring of 2009.

FIRE PREVENTION IN ABORIGINAL COMMUNITIES - MANUAL

CMHC developed this Fire Prevention Manual to help volunteer firefighters and housing managers in the effort to establish and improve fire prevention practices in their Aboriginal communities. The research undertaken was prompted by the results of CMHC's 2004 Canadian Housing Fire Statistics Report which presented alarming findings on the incidence of fire and its effects on First Nations communities in Canada. The Manual was developed by speaking with volunteer firefighters in ten different Aboriginal communities. The results of these discussions were then organized into case studies, each describing the prevention efforts of a particular community. Among the many topics discussed in the case studies are candle safety, chimney maintenance, arson prevention, and the beginning and growth of a volunteer firefighting squad. In addition to the ten case studies, the appendices of this Manual contain checklists and tools that volunteer firefighters and housing managers may find useful in planning fire prevention programs and finding more information about fire prevention in general.

Prepared by InterINDigital Entertainment Inc. with the assistance of gordongroup. Ottawa: Canada Mortgage and Housing Corporation, 2007. iii, 46 pages (2.02 MB) (Order number 65310)

Nota: Disponible aussi en français sous le titre : Manuel sur la prévention des incendies dans les collectivités autochtones

FIRES & FIRE PREVENTION

SPECIAL INTEREST GROUP ON FIRE PERFORMANCE OF HOUSES

In recent years, Canadian fire death statistics have followed a downward trend. As technological advances introduce new construction practices, building designs and materials into new house construction, the fire protection community needs evidence that safety isn't compromised. The Canadian Commission on Building and Fire Codes (CCBFC) and the Canadian Commission on Construction Materials Evaluation (CCCME) requested information regarding the potential impact of such changes on the fire safety of low-rise housing. In response, NRC's Institute for Research in Construction (IRC), in partnership with CMHC, government, industry, and codes and standards agencies, has undertaken a project to research fires in single-family dwellings and the factors affecting fire safety. The primary objective of this research is to determine the impact of innovative residential construction products and systems on fire safety. The project should be complete in 2007 and a final report available in 2009.

TESTING FIRE AND SMOKE MOVEMENT IN ACCESSORY APARTMENTS

The study tests the movement of fire and smoke in a single family residence containing an accessory apartment. A test protocol has been designed to measure the ability to control smoke and fire by use of fire separations, closures (including doors), ventilation systems, plumbing and firestops. The study also measures the time for smoke detectors to respond to a fire situation, for environments to become untenable and for occupants to safely evacuate. Results of this research will: 1. determine the significance of the fire performance of conventional fire separations in Canadian houses to the safety of occupants in houses containing an accessory apartment; 2. measure the fire performance of traditional house construction, as a benchmark for evaluating the fire performance of innovative construction products and systems; and 3. measure the products of combustion produced by a standard fire in various locations in a simulated building containing an accessory apartment as a benchmark for evaluating evacuation times. This research will be useful to authorities to produce legislation for safer housing, and in establishing performance criteria for accessory apartments. Occupants will be safer and better-informed of the dangers of household fires. The draft research report is complete and the final report should be complete in 2008.

HEATING AND VENTILATION

CHARACTERIZATION OF AIR LEAKAGE, PRESSURE REGIMES AND RESULTANT AIR MOVEMENT IN HIGH-RISE RESIDENTIAL BUILDINGS

The objective of this project was to undertake a field investigation of the ventilation and infiltration in a residential high-rise building. CMHC, in cooperation with the Institute for Research in Construction, monitored indoor-outdoor air pressure regimes in a high-rise for a period of one year. Ventilation system performance was also assessed. Pressure regime measurements, in conjunction with measured air leakage characteristics of selected assemblies, are used to estimate real-time air movement across the building envelope. This information will add to the body of

HEATING AND VENTILATION

knowledge governing infiltration-ventilation regimes and resultant heat load calculations in buildings. A report and research highlight documenting the results of the project will be available by the end of 2008.

CHARACTERIZE THE PERFORMANCE OF A WATER LOOP HEAT PUMP SYSTEM IN A MULTI-UNIT RESIDENTIAL BUILDING

Two-pipe water loop heat pump systems represent an innovative approach to heating and cooling multi-unit residential buildings. The system consists of a central water distribution system that distributes moderately warm water to each apartment in the winter and cool water in the summer. An in-suite heat pump fan coil unit is then used to heat or cool the apartment depending on the season using the central water loop as a heat source or a heat dump. In theory, the system will allow for simultaneous heating and cooling of different areas of the building by redistributing heat to where it is needed. This ability is thought to offer significant energy savings but the extent to which this may be the case has not been evaluated. CMHC is undertaking a project to characterize the performance of a water loop heat pump system in a multi-unit residential building in Ottawa so that the potential for energy savings can be assessed. The project will evaluate energy consumption, and operational and maintenance issues over a one-year period. The project will be completed in December 2008.

EXPLORING VENTILATION SYSTEMS FOR MURBS IN MARITIME CLIMATES

CMHC, in cooperation with the Homeowner's Protection Office of British Columbia, will conduct a research project to study two key ventilation issues affecting multi-unit residential buildings in the moderate coastal regions of Canada. Specifically, the project will evaluate the extent to which moisture laden outdoor air can be used to control indoor moisture loads without mechanical air conditioning or dehumidification. The project will also assess the ability of simple semi passive ventilation systems to exchange, condition, distribute and circulate air within individual apartments. Semi-passive ventilation systems offer many advantages to conventional MURB ventilation but the extent to which they can meet ventilation needs under varying indoor outdoor conditions and occupant lifestyles must be explored. The projects will be undertaken concurrently and will be used to produce guidelines for ventilation systems in multi-unit residential buildings in mild coastal climates. The projects will be completed in 2008.

HEATING AND VENTILATION

INVESTIGATE THE FEASIBILITY OF HUMIDISTAT CONTROLLED HEATING TO CONTROL MOISTURE AND PREVENT CONDENSATION INDUCED MOLD PROBLEMS IN HOUSES

This project will investigate the feasibility of humidistat controlled space heating strategy to regulate the temperature and humidity levels in dwellings to prevent condensation and mold growth while realizing energy savings. Existing literature and data on this strategy will be compiled from literature searches of available research, data and other source materials on humidistat controlled space heating, as well as interviews or site visits, where this technique has been used. The aim of the study is to determine if this approach is feasible for houses and apartments, and to provide information system design and configuration. This moisture and heating control strategy is applicable when occupants want to temporarily (short or long-term) maintain low interior temperatures to conserve energy while preventing humidity levels from increasing above the critical point at which condensation and mold growth could occur.

TUNE-UP GUIDE FOR MULTI-UNIT RESIDENTIAL BUILDINGS

A guide has been developed that compiles existing information on how on-site staff and contractors can improve, or fine tune, the performance of multi-unit residential buildings. Similar guidelines exist for commercial buildings but are referred to as re-commissioning guidelines. The guide will provide low cost and no cost methods to improve the performance of building envelope, space and domestic hot water heating, ventilation, health and safety, and electrical systems and appliances in multi-unit residential buildings. While the energy savings accrued are expected to be modest, use of the guide will ensure that buildings operate efficiently and performance problems are resolved before they become larger concerns. The Tune-Up guidelines will also allow a property owner or manager to establish optimal system conditions so that the impact of repairs, renovations, or energy and water efficiency improvements can be realistically evaluated. The Guide is available under the title: [Energy and Water Tune-ups for Multi-Unit Residential Buildings: A Guide for Property Owners, Managers and Custodial Staff](#) (Order number 65893). CMHC field testing of the Guidelines in Toronto and Saskatoon will be reported on by March 2009.

HIGH-RISE AND MULTIPLE UNIT CONSTRUCTION

BEST PRACTICE GUIDE ON FIRE STOPS AND FIRE BLOCKS AND THEIR IMPACT ON SOUND TRANSMISSION

This Best Practice Guide presents a broad-based consensus on technical solutions relating to the fire resistance and sound transmission aspects of fire stops and fire blocks for those who manufacture, design, specify, install and inspect these systems. The Guide was developed through collaboration of many organizations in the Special Interest Group on Suitable Acoustic and Fire Stop Technologies (SIG-SAFT). The Guide primarily addresses fire stops and fire blocks in the context of Canadian codes and standards. Requirements for fire stops and fire blocks in the National Building Code of Canada (NBCC) are conceptually similar to those in U.S. codes but significant differences between Canadian and American codes, standards, and terminology are identified. The Guide also

HIGH-RISE AND MULTIPLE UNIT CONSTRUCTION

identifies differences from the NBCC that have been approved in provincial building codes. The Best Practice Guide is not intended for use as a code document. While the Guide makes extensive reference to the NBCC as the source of requirements for fire stops and fire blocks in Canada, there are situations where best practice may require features beyond the NBCC requirements. These are addressed in many examples in Chapters 7 through 13, which illustrate good practice for fire stops at junctions and penetrations (plumbing, electrical, ventilation), combined with guidance on the corresponding acoustical issues such as noise leaks, plumbing noise, and structure-borne sound transmission. The authority having jurisdiction would decide on acceptance of such solutions, but it is hoped that the Guide will promote more informed and consistent practice across Canada for fire stops and fire blocks.

Prepared for Special Interest Group on Suitable Acoustic and Fire Stop Technologies. Prepared by J.K. Richardson, J.D. Quirt, R. Hlady. CMHC Project Officer: Barry Craig. Ottawa: Institute for Research in Construction, National Research Council of Canada, 2007. 1 volume + CD-ROM

BEST PRACTICE GUIDES UPDATE

This project will revise, one at a time, the five existing Best Practice Guides, starting with Brick Veneer Steel Stud published in 1996. New research and user feedback from seminars based on the guides and from CMHC's web site indicate that some text and details need updating. Partnerships will be developed with interested parties for input, review and promotion. A national competition will be held to select a consultant for each guide who will be responsible for coordinating and producing the revision work. Each consultant will work with an advisory committee, specific to each guide, who will participate in drafting the new edition. The advisory committee will include practitioners, industry representatives, manufacturers and regulators. The work will include a thorough study of the existing Guide, an analysis of users' feedback, and roundtable critique sessions. Public sessions will be held to discuss the proposed revisions. The consultant will then collect the information, produce the revised manuscript and obtain consensus from the advisory committee. The revised Brick Veneer Steel Stud guide is currently being reviewed by the advisory committee, and should be complete in 2009.

BETTER BUILDINGS - RETROFIT CASE STUDIES

This project documents and illustrates repairs and upgrades to multi-unit residential buildings across Canada. It is estimated that, in this country, \$300 M is spent every year in premature building failures. CMHC is collecting and publishing easy to read case studies to present to owners, architects, builders and property managers on what can go wrong and why, how to fix it and how much it will cost. Most cases will focus on the building envelope since the vast majority of documented problems occur there, in addition to examples of energy and acoustical upgrades. This project adds to CMHC's current documentation and publication of case studies on repair and retrofit of multiple-unit residential buildings. Ultimately, a repair guide will be developed based on this work. Case studies from across Canada are obtained from those directly involved in the repairs and involve buildings of all types of construction ranging in height from 3 to 50 storeys.

DEVELOPMENT OF GUIDELINES FOR FAN-COIL UPGRADES TO IMPROVE ENERGY EFFICIENCY AND THE INDOOR ENVIRONMENT IN EXISTING MULTI-UNIT RESIDENTIAL BUILDINGS

This study will undertake an investigation of opportunities to improve the performance of fan-coil systems in existing multi-unit residential buildings in terms of energy efficiency and indoor air quality. The study will review heating/cooling fan-coil design, from the historic to the current, as well as design, installation and manufacturing practices. It will also seek to establish the engineering and scientific basis for fan-coil problems such as mold, rust, leakage and noise and categorize design and maintenance opportunities that can lead to a range of potential remediation approaches with varying capital and maintenance cost implications. Two fan-coil preliminary retrofit guides will be developed for discussion that will cover design, implementation and maintenance, one for a technical (designer) audience and one for an owner-property manager audience.

FIELD REVIEW OF INSULATION RETROFITS OF SOLID MASONRY STRUCTURES

This project will investigate the condition of solid masonry wall assemblies that have been retrofitted with interior insulation to reduce energy use and enhance occupant comfort. Site investigations will visually assess the condition of masonry structures and adjacent insulation and framing layers on the exterior and interior of the wall assemblies. This information is required as there is a general perception in the housing industry that the application of interior insulation to solid masonry wall assemblies will cause the walls to deteriorate due to changes in the heat, air and moisture regimes to which the walls are exposed. This work will result in a compilation of case studies of solid masonry insulation retrofit projects and the development of guidelines for assessing and insulating solid masonry buildings. Case studies will be published as Better Building Case Studies and the knowledge gained through the case studies will be documented in a research publication by November 2008.

GUIDELINES FOR THE RETROFIT OF UNINSULATED MASONRY WALLS

Investigations of previously retrofitted solid masonry walls have been performed to determine the impact that the interior application of insulation has on the durability of the walls. The findings of the investigations will be published as case studies. Case studies will include a 120 year old solid masonry building in Montreal that was insulated 15 years ago by the application of spray applied polyurethane insulation on the interior of the walls, a 50 year old solid masonry office building in Ottawa that was insulated on the interior 8 years ago and several 1800's vintage houses and apartment buildings. Preliminary indications are that the interior application of insulation has not adversely affected the durability of the masonry walls of the case study buildings but further investigation will be required to confirm that this conclusion generally holds true for other buildings. The case study reports will be available by December 2008.

HIGH PERFORMANCE THERMAL INSULATION SYSTEMS IN BUILDING APPLICATIONS

CMHC will contribute funding to the Institute for Research in Construction (IRC) in support of its efforts to develop a high performance thermal insulation system and its contributions to a related International Energy Agency Annex in High Performance Insulating Systems. IRC will develop new nano-porous materials for use in vacuum insulation panels and the facility required to test and evaluate the insulation system. Based on the development of the material and the testing, IRC will produce a report on the high performance thermal insulation system it develops and the potential applications and guidelines for use. This project will serve as CMHC's contribution to the building of research capacity at the Institute for Research in Construction in the field of high performance thermal insulation systems. Potential applications within building envelope systems will be conceptualized in order to generate awareness of how this futuristic form of insulation may be eventually applied. The project will be completed by December 2008.

REVISIONS TO BRICK VENEER STEEL STUD BEST PRACTICE GUIDE

The objective of this project is to produce a revised version of CMHC's Brick Veneer Steel Stud Best Practice Guide, published in 1996. New research and user feedback from seminars based on the guide and from CMHC's web site indicate that some details need updating. Partnerships have been developed with interested parties for input, review and promotion. The consultant responsible for the revisions is working with an advisory committee, specific to the BVSS guide, which participates in drafting the new edition. The advisory committee includes practitioners, industry representatives, manufacturers and regulators. The work began with a thorough study of the existing Brick Veneer Steel Stud Guide, including an analysis of users' feedback, followed by roundtable critique sessions. Public sessions were held to discuss the proposed revisions. The consultant then collected the information, produced the revised manuscript and is now in the process of obtaining consensus from the advisory committee. Revisions to the text and details are with the advisory committee for their comments. The revised Brick Veneer Steel Stud Guide should be in print in 2009.

HOUSE CONSTRUCTION

CANADIAN WOOD-FRAME HOUSE CONSTRUCTION TECHNIQUES AND PRACTICES FOR APPLICATION IN OTHER CLIMATES

This research project will demonstrate how to adapt Canadian wood-frame house construction techniques and practices in other countries with different climates. The resulting research report entitled "Durable Wood-frame Construction for All Climates" is divided into four parts. The first and second parts introduce wood-frame construction and cover well-established building science principles for building envelope durability. The third part breaks new ground in the development of a series of methods that allows a designer or builder to select a particular wall construction based on local site conditions and climatic data drawn from sources, such as Koeppen climatic data and the NASA weather data base maintained on the world wide web. The fourth part provides examples of durable wood-frame building assemblies for most climates. The report focuses on the durability of the building envelope, and covers other related aspects of construction (e.g. ventilation and insects). The project is expected to be complete by the end of 2008.

GLOSSARY OF HOUSING TERMS - UPDATE

This project reviews the current edition of Glossary of Housing Terms and conducts research to identify new terms and definitions which are missing. The Glossary of Housing Terms was last updated in 1995, resulting in the absence of a number of new housing terms, some of which are included in CMHC's new information products. A few examples of new housing terms missing from the Glossary of Housing Terms include: surfactants, enthalpy recovery ventilator, building science, polyolefin, xeriscaping, pyrite, stachybotrys chartarum and brownfields. All the existing terms and definitions have been reviewed to ensure they are still appropriate and that the definitions are accurate. Construction related acronyms and abbreviations, and terms common to multiple unit residential buildings have been added. The revised Glossary of Housing Terms should be available in 2009.

IMPROVED PREDICTION OF SEISMIC RESISTANCE OF PART 9 HOUSES

Currently available approaches for the prediction of seismic resistance of conventional wood-frame construction (that is, buildings conforming to Part 9 of the NBC) are not able to predict the seismic resistance in a reliable manner. Experience in earthquakes and recent shake table tests of two-storey specimens have demonstrated generally good performance, but the limitations of this favourable behaviour are not well defined. A funding grant from CMHC External Research Program has been provided to Forintek Canada Corporation (FP Innovations) to undertake a research project, to develop simple mechanics-based methods for the prediction of seismic resistance of conventional wood-frame ("Part 9") houses. The work under this grant will present a quantitative basis for possible Part 9 seismic provisions of the NBCC based on data from past and ongoing work at Forintek and pertinent data from the literature. The work will limit itself to regular geometric shapes of wood-frame construction and will not consider torsional seismic effects. The project is expected to be completed by the spring of 2009.

RACKING PERFORMANCE OF WOOD SHEAR WALLS CONSISTING OF FINGER-JOINTED STUDS

In order to make lumber more sustainable and to reduce cost and waste, the use of finger-jointed wood studs is now permitted in building codes and is becoming increasingly common in residential construction. However, the strength of these studs when subject to tensile stress is not well understood. This 2008 External Research Program project will test the racking strength of finger-jointed wood studs used in shear walls. The data produced by this research will inform the designers of codes and standards of the comparative performance of finger-jointed and regular dimensional lumber studs, when used in shear walls. It will also measure the effect on racking strength of the number of joints in the stud. The project should be complete in 2009.

REDESIGN PRODUCTION PROCESS IN HOUSING CONSTRUCTION USING LEAN PRINCIPLES AND VALUE STREAM MAPPING

The housing construction sector is distinguished from other parts of the construction industry and offers the closest analogy to the manufacturing industry. However, the home building process is still managed in the same way as in other sectors of the construction industry. The aim of this External Research Program project is to develop a lean process for housing construction that improves the efficiency and reduces overall throughput time. The project has begun and is expected to be complete in 2009.

SEISMIC ISOLATION OF RESIDENTIAL WOOD FRAME AND LOW- AND MEDIUM-RISE MASONRY BUILDINGS

McMaster University has been granted funding through the CMHC External Research Program to investigate the application of a novel and economical fibre reinforced elastomeric base isolation system for both light-weight wood frame and low- and medium- rise unreinforced masonry residential buildings. The objective is to determine if an economically viable base isolation system can be developed to alter the natural period of the building and isolation system out of the range of maximum earthquake intensity for seismically vulnerable residential buildings. The project is expected to commence in the fall of 2008. Completion of the project is expected by end of 2010.

SEISMIC UPGRADES TO LOW-RISE HOUSING

The focus of this research project is the formulation of options for improving the earthquake preparedness of residential wood frame housing in British Columbia. The report addresses both new and existing single family and multi-unit wood frame construction. The project report is based on two major research projects conducted at UBC; the Earthquake 99 Project and Development of Bridging Guidelines. The earthquake damage estimates given in the report are based on sophisticated non-linear time history analysis of a comprehensive range of wood frame buildings. This type of analysis generates a realistic prediction of earthquake damage based on a probabilistic, performance-based methodology. Underlying soil type has a profound impact on earthquake damage of buildings; the reports' analysis is based on the assumption that 60% of housing units in south-west BC are founded on high-amplification soils. Earthquake damage is related to performance objectives: Life Safety (a measure of the occupant safety during the main earthquake event) and Habitability (a measure of the occupant safety during after-shocks). This project is completed.

HOUSE CONSTRUCTION

SEMINAR ON THE PROPER INSTALLATION OF WOOD I-JOISTS

This project developed training material, e.g. trainers manual and visual aids, validated through a pilot training session, for a one day seminar on the proper installation of wood I-joist floor systems. Most of the material is based on the "Installation Guide for Residential Wood I-Joist Floor Systems" but has been expanded to cover the actual installation process. The guide, and its accompanying pocket guide, serves as the participants' handout and resource material. The seminar is targeted to builders, renovators, building officials, home inspectors and the affected trades who work with wood I-joists. The seminar has been prepared and opportunities to present it are now being explored.

SUSTAINABLE BUILDING SCIENCE BEST PRACTICES

The objective of this project is to consolidate energy-efficient and sustainable building science best practices into one comprehensive illustrated source that will serve as a text book and training manual for building science courses. It will be used in architectural programs at colleges and universities, and by builders and designers. The result of this research will be a common reference that describes sustainable building science for Canadian construction that is based on rigorous scientific research and testing, and energy conservation measures and that demonstrates best practices. It will be tailored to existing teaching curricula and it will be extremely useful to architects, engineers and building scientists resulting in an accurate and common understanding of sustainable building science principles and their interrelationship with one another. The manuscript is expected to be complete in September 2009.

HOUSING RESEARCH

CONTRIBUTION TO RESEARCH PROJECTS AT THE CANADIAN CENTRE FOR HOUSING TECHNOLOGY

In co-operation with NRC and NRCan, CMHC will continue to support research projects to evaluate energy efficiency technologies on the performance of the test houses at the Canadian Centre for Housing Technology (CCHT). Several technologies have already been evaluated at the facility, and research reports are available from the CCHT web site http://www.ccht-cctr.gc.ca/documents_e.html. CMHC Research Highlights on 5 of these projects are available from CMHC's Web site. Several other projects are being considered for testing and evaluation by the CCHT's Research Committee, which represents the three partners, Canada Mortgage and Housing Corporation, Natural Resources Canada and the National Research Council of Canada.

INDOOR ENVIRONMENT

CMHC PARTICIPATION IN THE HEALTHY INDOORS PARTNERSHIP (HIP)

This project is a collaboration between government, industry and the private sector to implement the Healthy Indoors Partnership (HIP) vision and business plan for improving indoor environmental quality in Canada. The mandate of the Healthy Indoors Partnership, incorporated in 2003 as a not-for profit organization, is to bring industry, government and nongovernment organizations together to identify, develop, implement and manage activities, such as inter-agency research, designed to create healthier indoor environments in Canada. CMHC will collaborate on HIP Indoor Air Quality consultation. In May 2004 the HIP released proceedings from an expert/stake holder consultation on mold in the indoor environment. HIP has also held round tables on filtration in residential dwellings and produced a buyer's guide for consumers in the fall of 2006. A round table on Low Emissions Materials, Products, and Services was held in February 2007. Consumer and industry guides will be produced on this subject and should be available late in 2008.

INVESTIGATING THE RELATIONSHIP BETWEEN INDOOR AIR QUALITY AND SEVERE RESPIRATORY TRACT INFECTIONS IN INUIT INFANTS IN BAFFIN REGION, NUNAVUT

CMHC has contributed to a study investigating the relationship between indoor air quality and severe respiratory tract infections in Inuit infants in Baffin region, Nunavut. The initial work was carried out in conjunction with the Children's Hospital of Eastern Ontario, Health Canada, Natural Resources Canada, the Nunavut government and Nunavut health and housing agencies. Testing took place over the winter of 2003 in 20 houses in Cape Dorset. It included air quality measurements, blower door testing, and long term air change rate measurement. These results show that some of the houses are under ventilated, but that air quality is similar in many aspects to more southern housing. A follow-up project with the partners explored ventilation solutions in Nunavut communities. The second phase surveyed air change rates, carbon dioxide levels, and occupancy factors in 100 houses in four Nunavut communities, to see if the Cape Dorset results are typical. Low ventilation rates were measured in many of the houses and corresponding high CO₂ concentrations resulted. A CMHC Research Highlight on the pilot project and the 100 house survey has been issued ("Nunavut Housing Ventilation Research 2003-2005", Research Highlight Technical Series 05-116). The current phase involves the installation of HRVs in 100 existing Nunavut houses and an analysis of the effects on occupant health. The project team hoped to have the HRVs installed in the fall of 2006, with the health monitoring taking place over the winter of 2006/2007. However, problems with weather, contractor performance, equipment installation, and finding test houses delayed the work. Currently, there are about 63 HRV units installed in four communities, but not all returned good data. The occupants' health was monitored over the winter of 2007-2008. Data analysis is in progress to see if there are conclusions available despite the small sample size.

LET'S CLEAR THE AIR INDOOR AIR QUALITY (IAQ) INITIATIVE

This initiative delivers information on indoor air quality in the home to targeted audiences, the end result of which will benefit Canadian homeowners and occupants. Basic information to increase awareness and appreciation of indoor air problems is through the one-day Let's Clear the Air seminar (for housing and health professionals) or the Build and Renovate to Avoid Mold workshop (for builders, renovators, architects, real estate and insurance appraisers). A new two-day Mold Remediation Workshop trains builders, renovators and contractors on how to remediate mold safely and properly. Qualified individuals can also proceed to the CMHC Residential Indoor Air Quality Investigator Training Program. Individuals who complete the training program acquire the skills to inspect homes for IAQ problems and to provide informed advice to homeowners on how to correct these problems. As a private business, they offer their professional services to the public for a fee. For referral purposes, a list of persons having completed the training is available from CMHC offices.

RADON MITIGATION PLANNING INSPECTION AND MITIGATION SYSTEM INSTALLATION

The Radiation Protection Bureau of Health Canada (HC) released a new, lower radon guideline (200 Bq/m³) and is planning to increase public awareness of radon risks. HC has also had drafted a protocol for radon remediation in houses to help homeowners and contractors solve radon problems. Before general release of the protocol, HC piloted its use on a high-radon house to ensure that the recommendations and sequencing are appropriate for Canadian conditions. CMHC managed the research field work and provided building science and other technical support to the testing, remediation work, analysis and reporting.

The house selected was a two year old, two storey suburban house in the west end of Ottawa. It had initial radon concentrations of about 1400 Bq/m³, despite having polyethylene under the slab and no apparent holes in the foundation. A common radon mitigation measure, sub-slab depressurization, worked well at reducing indoor radon concentrations to under 50 Bq/m³.

REVIEW OF THE RELATIONSHIP BETWEEN HOUSE VENTILATION RATES AND HEALTH

This work would attempt to establish the relationship between adequate ventilation and health (or inadequate ventilation and poor health), through literature searches and appropriate field testing. The project should lead to a better understanding of the relationship between house ventilation and occupant health. If the project establishes a strong correlation between good ventilation and healthy residents, it will be useful material for building codes, medical authorities, ventilation standards, and the ventilation industry. Currently, CMHC is investigating the possibility of coordinating this research with the Canadian Institute for Health Research (CIHR) or the Quebec public health agency (INSPQ) to see if their planned research projects would complement CMHC's objectives.

TESTING THE DEPRESSURIZATION RESISTANCE OF GAS AND OIL FURNACES

CMHC and NRCan have been co-operating in the development of a test protocol for determining the spillage resistance of residential combustion appliances. There was initial testing of both gas and oil appliances. The test protocol and structure is relatively simple and robust. Some appliances are able to operate under high levels of depressurization better than others. The current research project extended the results through supplemental testing of 10 additional gas appliances. The results are promising and have been published under the title: [Depressurization Spillage Testing of Ten Residential Gas-Fired Combustion Appliances.](#) As in the earlier research, most of the "spillage resistant" appliances did pass the 50 Pa depressurization test. The eventual goal is to integrate such depressurization testing into appliance standards, and a CSA committee is being set-up to examine this issue. CMHC was not able to locate appropriate vertically-vented, mid-efficiency oil furnaces with improved spillage resistance for the proposed parallel study on oil appliances.

YEARLY VARIATION IN BIOLOGICAL CONTAMINANTS

Ten houses that have previously been characterized for biological contaminants during the winter have been retested a year later to determine the variability of microbiological markers. The data is being analyzed to identify climatic and other factors that may affect year to year measures of biological contaminants in houses. The validity of "one point in time" testing to characterize multi-year biological contaminant loads in houses during the winter will be assessed. This project will increase knowledge of yearly winter variations in microbiological loads in houses, and of testing procedures that provide the most repeatable long term building microbiological markers. One potential outcome would be the confirmation that CMHC's methodology of assessing IAQ problems by inspection alone is still the most accurate assessment of biological contamination without expensive testing or lab analysis. This may also indicate which testing methodology represents the most stable indicator of long term biological indicators in houses. The results will be available in the spring of 2009.

MOISTURE AND MOLD

CONTRIBUTION TO THE INDUSTRIAL RESEARCH CHAIR IN ALLERGENS AND TOXINS FROM MOLDS IN THE BUILT ENVIRONMENT

There is no method to obtain a quick and inexpensive determination of the nature of mold contamination in a house. A more fundamental understanding of the by-products of mold that are harmful to people is needed along with knowledge regarding the thresholds that should be avoided and cheap and reliable ways of classifying moldy and non-moldy houses. CMHC is supporting the ongoing research of the National Science and Engineering Research Council Chair on Allergens and Toxins from Molds in the Built Environment at Carleton University. The first five years work of the Chair developed the expertise to identify human allergens, produce antibodies specific to each allergen and isolate and test the effect of toxins on lungs from *Stachybotrys chartarum*, *Aspergillus versicolor* and *Penicillium chrysogenum*, three representative fungi found in houses that require large, medium and low amounts of moisture. The second five years, starting in June 2006, will expand the expertise to a larger number of molds to make it feasible to use these reagents as a cheap and reliable way of testing for mold contamination in houses.

HOW IMPORTANT ARE DEHUMIDIFIERS IN PREVENTING MOLD IN HOUSES?

This study will test the effectiveness of dehumidifiers in managing relative humidity in basements. Measurements of relative humidity and moisture readings of selected surfaces will be taken in houses of varying ages and characteristics when a dehumidifier is running and when it is turned off. A pilot study of three matched houses in the same area, conducted in the fall of 2004, has recommended that houses in three regions - Ontario/Quebec, BC/Atlantic and Prairies, be studied over a full year period with dehumidification when needed. A larger study will monitor 30 houses in different regions for one year without dehumidification and a second year with dehumidification. The field study has been completed. The report will be released in 2008.

LITERATURE REVIEW ON HISTOPLASMA, BLASTOMYCES AND CRYPTOCOCCUS GATTII AND THE IMPLICATIONS FOR THE DESIGN, OPERATION AND MAINTENANCE OF HOUSING

In this project, experts in fungi will conduct a thorough literature review of Histoplasma, Blastomyces and Cryptococcus gattii, three fungi that cause infectious diseases in people. Histoplasmosis occurs from exposure to feces of birds and bats, while blastomycosis occurs after exposure to the spores in soil. Infections due to cryptococcus gattii are limited to Vancouver Island, though cases have been seen in Vancouver. The literature review will form the basis of housing advisories on how to avoid exposure to these fungi. The project is a cooperative effort between CMHC and Health Canada. The literature review has been completed. An About Your House fact sheet is in preparation.

MODIFY AND UPGRADE WALLDRY COMPUTER PROGRAM

The objective of this project is to modify and upgrade WALLDRY, a 1980's computer program developed by CMHC, which models the flows of moisture, heat and air through wood-framed outer wall assemblies in response to given external climatic loads and interior temperature and humidity conditions. The original QBASIC code used in WALLDRY will be recast using a Windows-based computing language to overcome the memory management limitations inherent in a DOS based program. The upgrades would also incorporate corrections applied to any of the algorithms from the use of WALLDRY in recent simulation studies, programming enhancements in a user-friendly environment, including input capabilities and a material properties database, and to provide a more useful means of presenting the output of interest. Project completion is expected by spring 2009.

POTENTIAL FOR MOISTURE PROBLEMS DUE TO PLASTIC SHEETING IN WALL ASSEMBLIES

This project examined whether plastic air-vapour barriers currently used in Canadian wall assemblies are an asset or a problem. There has been significant criticism recently of the use of plastic in above-grade and basement wall assemblies, in that plastic limits the ability of the wall to dry into the house, and that it provides a condensing plane for water vapour driven into the wall when the sun heats the exterior sheathing. The research assessed the criticisms levelled against plastic sheeting and compared the use of plastic to other alternatives, using field tests and hygrothermal modelling. The first year of field testing in a new house and a test hut was completed in the summer of 2006. Testing took place in basement and above-grade walls. Reporting on the field testing and the ensuing simulation and analysis was published in the fall of 2007. The results were mixed. In some cases, the walls with poly created high moisture situations; in other cases, the no-poly walls had higher moisture and mold.

The field testing of the above-grade walls was extended for another year to look at brick wall venting and alternative vapour barriers (e.g. paint). A draft report on the second year of field testing was delivered in spring 2008, but there has been no final report yet. The relatively simple fixes essentially resolved the moisture problems both in the poly and no-poly walls.

MOISTURE AND MOLD

WIND-RAIN RELATIONSHIPS IN SOUTHWESTERN BRITISH COLUMBIA : FINAL REPORT

Building envelope failures in Southwestern British Columbia have brought to light the strong influence of wind-driven rain on building envelopes. This study examines wind and rainfall data collected throughout the year from 12 meteorological stations: four on Vancouver Island and eight in the Lower Mainland. Results indicate that prominent wind directions during rain, as well as maximum wind speed, vary with location. Furthermore, all stations exhibited a marked difference in the wind direction and frequency of higher wind speeds for wet hours versus all hours.

NORTHERN HOUSING

CMHC CONTRIBUTION TO THE COLD CLIMATE HOUSING FORUM

The Cold Climate Housing Research Centre in Fairbanks, Alaska hosted the 'Sustainable Northern Shelter in A World of Diminishing Resources', the first biennial forum on Sustainable Northern Shelter on October 29 and 30, 2007. The conference was organized to bring northern housing experts together from across the circumpolar region to explore issues, solutions and proposed future research in northern housing. The conference addressed areas that include energy efficiency, sustainable buildings, building science, materials, alternative energy, infrastructure, and the design of northern houses and communities. It was intended that the conference be the first of an ongoing series of northern conferences to occur every other year in different circumpolar regions and countries. Planning for the second northern housing forum, to be held in Canada, in late 2009 or early 2010 is underway.

INTEGRATED DESIGN AND EVALUATION OF A CONSTRUCTED NORTHERN SUSTAINABLE HOUSE (E/2 PROTOTYPE)

In this partnership project, two "Sustainable Northern Houses" have been designed by CMHC in partnership with a Tr'ondek Hwech'in First Nations community in the Yukon and the Nunavut Housing Corporation in Arviat, Nunavut. The houses have been designed to consume less than 50% of the Model National Energy Code of Canada for Houses energy requirements, and are suited to the northern culture and lifestyles. The project has incorporated knowledge and connections that were gathered in northern design charrettes, with the design work for each Sustainable Northern House carried out in consultation with the northern community and territorial northern housing provider. Construction of the Tr'ondek Hwech'in House was completed in January, 2008. Materials for the NHC Arviat House will be sea-lifted to the community during the summer/fall of 2009 with construction to be carried out in the fall of 2009 or spring of 2010. The evaluation of the project will include monitoring the energy performance of the constructed houses, carrying out a cost/benefit analysis of the energy savings of each Sustainable Northern House vs. a typical new house in the community, and carrying out an analysis of the success of the cultural issues being addressed in the design. CMHC facilitated design workshops, was the lead in designing the houses, and is undertaking the performance evaluation of the Sustainable Northern House Prototypes. A 15 month monitoring project on the completed Tr'ondek Hwech'in House began in February 2008. The project is sponsored in part by the Program for Energy Research and Development (PERD). The research will be completed by December 2011.

NORTHERN SUSTAINABLE HOUSE : AN INNOVATIVE DESIGN PROCESS

Unique environmental, cultural and economic challenges prevail in northern Canada. In an effort to create housing that is highly energy efficient and, at the same time, culturally acceptable to its inhabitants, Canada Mortgage and Housing Corporation (CMHC) partnered with the Nunavut Housing Corporation (NHC) in Nunavut and the Tr'ondek Hwech'in First Nation of the Yukon in 2006 to design two versions of the Northern Sustainable House. The ultimate aim of the project was to promote the construction of culturally appropriate, energy-efficient housing across the north; the project hoped to achieve an energy performance level 50 percent better than the Model National Energy Code for Houses (MNECH).

Following the model of the Integrated Design Process, house design charrettes were held in Arviat, Nunavut, and Dawson City, Yukon, in late autumn 2006. These multidisciplinary workshops brought together townspeople and technical experts to explore the social and environmental factors that influence the effectiveness of housing in each community.

In initiating the Northern Sustainable House project, CMHC proposed to organize design charrettes in each community; carry out the house designs, including energy efficient construction details; analyze the performance of the houses; and cover the incremental costs of features required to meet the energy conservation goals of the project. In each location, a CMHC-led design and review team explored design options and developed alternative construction systems. As part of the design process, the energy performance of proposed wall systems for each house was modelled.

The design process took participant comments into account, with designs developed for two models of the Northern Sustainable House: one for Inuit communities in the eastern arctic (above the tree line), and one for the western arctic (below the tree line). One Northern Sustainable

NORTHERN HOUSING

House is now under construction in Dawson City, and two models of the Arviat design are planned for construction in 2008.

This report focuses on the discussion and design process and is based on interviews with some of the participants in the charrettes that were held in Arviat and Dawson City.

REDUCING ENERGY USE OF NORTHERN HOUSING BY HALF - PART 3: BUILDINGS AND COMMUNITIES / INTEGRATED DESIGN CHARRETTES FOR SUSTAINABLE BUILDINGS AND COMMUNITIES

As part of the intergovernmental strategy to reduce energy requirements in the North and improve housing conditions, Integrated Design Charrettes are being carried out in northern communities with the residents/builders and community leaders with the goals of sustainable improvements and lower costs in their buildings and communities. The strategies generated from this initiative will enable northern communities to reduce energy and water costs significantly. This project involves the organization and facilitation of community design charrettes in northern communities to formulate improved solutions to meet their evolving housing needs. The charrettes provide an opportunity to align the thinking of various experts, community builders, local inhabitants and municipal leaders about the potential for the design and construction of sustainable northern housing as well as a thorough discussion of the barriers and challenges that must be overcome. It will also provide a technique for northern communities to rethink their community plans, their process of design and better northern housing delivery options using sustainable objectives which are adapted to their needs. The charrettes will be completed by the end of 2008. A report documenting the outcome of each or all charrettes will be available following each event.

RENOVATION AND INSPECTION

CANADIAN HOME INSPECTORS AND BUILDING OFFICIALS (CHIBO) - PHASE III NATIONAL INSPECTION INITIATIVE

The purpose of this partnership project is to assist the Alliance of Canadian Building Officials' Association (ACBOA) to implement CHIBO developed models for national accreditation and certification of building officials. CMHC support is being used to pilot the certification model, to develop necessary application assessment tools, to establish governance committees and boards as required by the certification models. The implementation of the National Certification and Accreditation program for municipal building officials will help to harmonize the knowledge and experience requirements for building officials and enhance the capacity and standing of the building officials' industry in Canada. The National Program was implemented in June 2008.

CANADIAN HOME INSPECTORS AND BUILDING OFFICIALS NATIONAL INITIATIVE PHASE II

The overall objective of this multi-phased Canadian Home Inspector and Building Official (CHIBO) national initiative is to raise the level of competency of the private home inspection industry, the municipal building officials, and the First Nations building officers and establish a qualified and recognizable industry to better serve their clients. Phase I activities resulted in the development of Occupational Standards for each of these sectors. Phase II, which built on the results of the Phase I, is now complete. The primary objectives of Phase II, to develop certification and accreditation models for the inspection industry, have been met. The certification and accreditation models were implemented by the industry sectors in 2006. Technical Research Highlight 04-112 summarizes this research project and is available on the CMHC Web site. The certification and accreditation for the Building Officials has been implemented since the spring of 2008.

STATUS : Completed

SUSTAINABLE DEVELOPMENT & HEALTHY HOUSING

ACHIEVING 90% REDUCTION IN ENERGY CONSUMPTION IN SUSTAINABLE NORTHERN HOUSES

This project will apply Net Zero (Equilibrium) technology to the design of a house to be built in the Yukon with the objective of having the home consume 90% less energy than the amount used by the house were it to be built to the Model National Energy Code for Houses (MNECH). CMHC will provide technical advice and support for designs and architectural drawings, which will be prepared by the Tr'ondek Hwech'in First Nation Band. A mechanical consultant with experience in the design of renewable energy systems and proficient with Hot2000 computer modelling will design mechanical systems, provide layout drawings, and simulate estimated energy consumption for a family of two adults and two children. The energy consumption of the dwelling will be monitored for one year following occupancy. The developer/housing provider will provide a detailed description of the design and technologies used, as well as itemized cost comparisons to a similar house conforming to the MNECH and to the house built by the Tr'ondek Hwech'in First Nation Band. The project will produce a research report that may assist in designing and building sustainable

housing and establish the feasibility of near net zero energy houses in the North. The project should be complete in 2010.

ADVANCEMENT OF COMPETENCY IN INTEGRATED SUSTAINABLE BUILDING DESIGN - SUPPORT OF CONCORDIA UNIVERSITY IN THE 2005 'SOLAR DECATHLON'

In this project, and as one of various contributors, CMHC supported the Canadian team entry led by Concordia University to participate in the 2005 Solar Decathlon in Washington D.C. Based on a preliminary competition, nineteen teams were selected to participate in this event; the majority of the teams were from the United States, with one each from Canada, Spain and Puerto Rico. The nineteen university teams built small solar houses, of about 60 to 70 square metres in size, on the National Mall in front of the Capital Building in October 2005. The objective was to design a completely solar powered house that is self-sustaining for an entire week. Specified requirements included minimum lighting levels, acceptable interior temperature range, water usage and hot water temperature levels. The houses had to be able to accommodate normal domestic tasks such as laundry, cooking and showering. CMHC's involvement included financial and implementation support to the process, technical advice and guidance, and creating and transferring knowledge on renewable energy based sustainable housing. This project's overall outcomes are: 1) to illustrate how solar energy can improve Canadians' quality of life: solar energy is clean; it significantly reduces pollutant emissions; and solar energy is renewable thereby increasing a nation's energy security; 2) to teach the solar decathletes and the public about how energy is used in their daily lives and to illustrate the energy intensity of various daily activities; 3) to demonstrate that market-ready technologies exist that can meet the energy requirements of our daily activities by tapping into the sun's power; 4) to meet these needs while providing an attractive structure in which to live, work and play. A related long-term objective of this project is to build enhanced alliances between project partners leading to the capacity development for a future Canadian Solar Decathlon competition. A final summary report will be available in 2008.

ANALYSIS OF RENEWABLE ENERGY POTENTIALS IN THE RESIDENTIAL SECTOR THROUGH HIGH RESOLUTION BUILDING ENERGY SIMULATION

Due to recent advancements in renewable energy technologies such as photovoltaic (PV) and micro-wind turbine systems, the potential for large-scale deployment of such energy sources for a more sustainable society has never been greater. This research provided a detailed techno-economic assessment of renewable energy potentials in the residential sector through high-resolution building energy simulation using large numbers of representative housing data. Two sub-projects were presented. The first was on the modeling, simulation and feasibility analysis of the hybrid heating system with solar photovoltaics for new housing in cities across Canada. Findings relate to both increase and savings aspects of actual energy use. The analyses also showed the varying energy and environmental benefits of the proposed hybrid heating system in a typical R-2000 home. The second sub-project was on the modeling, simulation, and feasibility analysis of the hybrid building integrated renewable electricity system in the existing Canadian residential stock. The results were extrapolated to the national level to assess the potentials of greenhouse gas (GHG) reduction and were found that using these technologies could result in the GHG reductions of 15% and 20% of the base case emission levels without the proposed hybrid renewable electricity generation systems.

DEVELOPMENT OF A SUSTAINABLE PERFORMANCE ASSESSMENT TOOL FOR HOUSING

An External Research project was initiated to develop a sustainability performance assessment tool for housing in Canada. The project provides a framework that permits a broad-scope sustainability assessment of multi-family housing in Canada. The framework is based on SBTool, an internationally accepted assessment toolbox that allows specific ratings to be produced for a variety of regions and end uses, by adjusting scope, weights and (local) benchmarks. The system covers a full range of environmental, social and economic variables, provides internal calculation tools for the estimation of Green House Gases, based on regional emission values, and also an approximate embodied energy calculator. The version provided to CMHC has been calibrated for multi unit residential buildings, but other alternatives, such as mixed use buildings (for example residential and retail) can also be assessed. The tool with its Guide (Overview) is available for download at iiSBE (International Initiative for a Sustainable Built Environment) Website: http://iisbe.org/iisbe/sbc2k8/sbc2k8-download_f.htm A Research Highlight that describes the tool will be available in early 2009.

INTEGRATED SUSTAINABLE BUILDING DESIGN - SUPPORT OF THE 2007 'SOLAR DECATHLON'

In this project, CMHC supported the Canadian team entry led by ETS to participate in the 2007 Solar Decathlon in Washington D.C. The objective of the competition is to design and build houses of about 60 to 70 square metres in size which are completely solar powered and self-sustaining for an entire week. Specified performance requirements were measured in ten categories, and include energy performance, lighting levels, acceptable interior temperature range, water usage and hot water temperature levels. CMHC's involvement included financial and implementation support to the process, technical advice and guidance, and creating and transferring knowledge on high performance, renewable energy based sustainable housing. The ETS-led Canadian team, Team Montréal, participated in the Solar Decathlon challenge, which ran from October 12th to 20th, 2007. The team placed an impressive 8th place overall. Following the event, the solar house, Lumen Essence, returned to Canada and is currently being rebuilt at the Biosphere in Montréal. CMHC will prepare a Research Highlight to document the features of the Lumen Essence house.

MEASURING SOLAR PERFORMANCE

The purpose of this External Research Program project is to build and operate a measurement and monitoring program to evaluate the performance of a conventionally built house which uses a range of active and passive solar systems. It is fully off-grid, self sufficient in energy and includes a number of technologies. The intent of the project was to install and operate a number of small data collection systems over a three year period. In the fall of 2007 the monitoring moved to an alternate data management system which will produce better final results, and will give a comprehensive view of the actual performance of the house in regular use, including its operating environment. The project will continue for one additional year until January 2009.

NSERC CANADIAN UNIVERSITY NETWORK ON "SOLAR ENERGY UTILIZATION IN BUILDINGS"

CMHC is supporting a new Natural Sciences and Engineering Research Council of Canada (NSERC) funded University Network on "Solar Energy Utilization in Buildings", to achieve the objective of enhancing the capacity of the residential industry to develop solar buildings with substantially reduced purchased energy needs. The overall vision of the Network over its five year period will be to advance the adoption of new knowledge, tools, practices and technologies for cost effective construction of solar zero-net-energy buildings in Canada. The main objectives of the Network over its five-year research program are the following:

1. To develop effective techniques for integration of solar collection, storage and utilization systems in the building envelope.
2. To develop and improve solar energy utilization technologies so as to reduce cost and raise overall efficiency.
3. To develop and demonstrate affordable, reliable, building integrated, distributed power generation systems based on solar energy for residential and commercial buildings.
4. To develop simulation design tools and methodology that may be effectively utilized throughout the design process.
5. To transfer these outputs to the end users.
6. To contribute to the development of government policies and programs aimed at fostering the adoption of solar technologies in buildings

CMHC will seek opportunities to transfer the knowledge gained through the network research to stakeholders in the housing industry.

REGIONAL PILOT DEMONSTRATION OF NET ZERO ENERGY HEALTHY HOUSING

This project involves the development of a national net zero energy healthy housing demonstration and implementation initiative through an industry partnership to advance new Canadian housing towards a net zero energy consumption goal. The initial project concept involves the design, construction, demonstration and monitoring of 12 net zero energy healthy houses in a project called the EQUilibrium Sustainable Housing Initiative. The designs for the 12 projects were completed in early 2007. Construction of 6 projects has been initiated with the rest expected to follow in the next few months. Demonstrations will permit the design-construction teams to show their achievements to the residential building industry and consumers. Upon completion of the demonstrations, the houses will be sold and CMHC will monitor the performance of the houses for one year post occupancy. Final project reports are expected by June 2011. Based on the outcome of this demonstration initiative, CMHC will explore with its partners and stakeholders opportunities to expand this initiative more broadly across Canada. The EQUilibrium Sustainable Housing Initiative is based on CMHC's five principles for Healthy Housing. It combines sustainable community planning, passive solar, energy efficient design, construction and appliances, with commercially available grid tied renewable energy systems to achieve net zero energy consumption and reduced GHG emissions on an annual basis. The intended results and impacts of the EQUilibrium initiative are to develop strategic alliances between industry and government to reduce the energy intensity of our housing sector, mitigate household energy cost increases in the medium term, foster a growing renewable energy and sustainable housing industry in Canada, increase consumer awareness and demand for sustainable housing, and support Canada's goal of reducing pollutant and green house gas (GHG) emissions. The development of the EQUilibrium initiative in Canada will also help to ensure Canada's inclusion in competitive international housing markets and our next generation of value added exports.

TAP THE SUN: REVISION AND UPDATE

CMHC's new, updated "Tap the Sun" publication provides information on solar design for Canadian homes. It builds upon the earlier version and this will help to ensure that the publication continues to be one of the premier passive solar design resources available to consumers and the residential construction industry. The revised publication contains new information on the Integrated Design Process (IDP) as an essential step in the delivery of passive solar designs. The new "Tap the Sun" has been structured to allow potential users to read the entire book or to go to sections for comprehensive information on specific subjects. This approach allows relatively uninformed readers to learn about passive solar design strategies and provides sufficient knowledge to allow for the participation in a design of a passive solar house. The publication contains updated design data, envelope information particularly with respect to new window technologies, and the latest developments in solar thermal systems and photovoltaics, well detailed case study projects, new references to occupant health and comfort, mechanical and electrical systems and identified key resources. A companion CD includes improvements/updates to the integrated tools such as the Comfort Design Checker.

WATER CONSERVATION, REUSE & MANAGEMENT

ALTERNATIVE STORMWATER MANAGEMENT - WATERSHED RESTORATION

This work will see the development of a number of integrated stormwater planning, design and management tools for builders, developers, and municipal staff. These tools will assist in smart urban development by providing a means for assessing watershed health and prioritizing areas for restoration thereby allowing stakeholders to make informed choices on urban development and stormwater management. The ecologically engineered storm water management tools presented here will improve stormwater drainage systems, improve water quality and reduce the negative impact of stormwater infrastructure on the environment by utilizing an ecological system that has a greater resilience to drought and flooding in the face of climatic changes. Project completion and report submission are scheduled for December 2008.

RAINWATER HARVESTING - DEMONSTRATIONS

CMHC is supporting innovative projects with the Cities of Toronto and Guelph to advance rainwater harvesting technologies and strategies in the Canadian residential sector. A rainwater harvesting system for toilets and irrigation will be incorporated and monitored in a high-rise multi-unit residential building in downtown Toronto. A multi-goal project with the University of Guelph will serve to pilot rainwater harvesting applications for indoor and outdoor residential use while addressing technical and regulatory issues related to design, certification, approvals and performance. Information from Canadian and international examples regarding code issues, plumbing issues, technology design and performance issues will be adapted. The Cities of Toronto and Guelph are supporting the projects by working to remove any municipal obstacles that may prevent the use of rainwater harvesting. Results from this work will be used to promote and increase awareness regarding the feasibility of rainwater harvesting for onsite water reuse particularly for large scale residential developments. A final report for the Guelph project will be available from CHIC by December 2008.

SMALL COMMUNITY WASTEWATER TREATMENT OPTIONS

Wastewater servicing is an issue of increasing importance to society, in particular small communities across Canada. Typically communities with wastewater problems are given two options, on-site wastewater treatment or centralized sewer systems. The Ottawa Septic System Office (OSSO) believes that small communities do not have access to enough unbiased information when making servicing decisions. The OSSO will identify several wastewater options for communities with an average daily wastewater flow of < 50,000 L/d. The proposed research will focus on wastewater treatment options utilizing subsurface disposal. The research will examine multiple wastewater servicing options and solutions to associated problems. Efforts will be concentrated on existing approved technologies as well as innovative and emerging technologies. Work is currently underway to analyse data gathered from a literature review and a survey to municipalities on onsite wastewater issues. A final report is expected for December 2008.

SUPPORT FOR NATIONAL ONSITE WASTEWATER RESEARCH PROGRAM

CMHC in conjunction with the Canadian Water and Wastewater Association and the provincial onsite associations of Ontario, Alberta, and B.C. will work with national stakeholders across the country to address research and policy gaps in the area of decentralized wastewater management. The network will identify and prioritize all research and policy issues, and leverage funding to address these issues and communicate the results across the country. As a starting point, CMHC will support targeted research for the development of onsite wastewater technology verification and installation standards. To date CMHC has supported the Bureau du normalisation du Québec in the development of a national standard for onsite wastewater technology verification. Three committee meetings have taken place and the draft national standard is now out for a public review period ending April 14th, 2008.

A second initiative is support for the development of a national onsite wastewater installation standard through the Canadian Standards Association. Two meetings have taken place and a finalized standard is anticipated in 2011.

SOCIO ECONOMIC RESEARCH

ABORIGINAL HOUSEHOLD, HOUSING AND COMMUNITY CONDITIONS BASED ON THE ABORIGINAL PEOPLE'S SURVEY (APS)

The consultant hired for this project has completed consultations with stakeholders both internal and external to CMHC, including all National Aboriginal Organizations (NAOs). He is now using the consultation results to identify and develop an analysis plan and an assessment of data requirements in preparation for the analysis of custom data linking Statistics Canada's post-censal Aboriginal People's Survey (APS) to CMHC's custom 2001 Census-based housing conditions indicators. The development of data specifications and the research issues to be analysed is being done through consultations between the consultant, CMHC staff, DIAND, and the NAOs. Based on these specifications, Statistics Canada will produce the custom data, which will be analysed and applied to the research issues (using the analysis plan developed through the consultation process). The 2001 APS is the single most comprehensive source of information on household, housing and community conditions faced by Canada's Aboriginal Peoples. The APS has been linked to CMHC's 2001 Census-based core housing needs indicators and the combined data are beginning to be acquired for analysis to profile the housing and community challenges facing each of Canada's Aboriginal peoples. As the research is completed, research findings will be published via research reports/highlights and at the end it is planned that an electronic data base specific to Aboriginal housing conditions will be developed and released.

ESTABLISHING EFFECTIVE HOUSING MARKETS IN FIRST NATION COMMUNITIES

Based on recommendations of Regional staff and on consultations and/or focus groups with First Nations, and using the information (best practice/critical success factors) obtained in the Part IX Home Ownership Implementation Strategy, the project will identify a number of First Nation communities that are desirous of and willing to introduce a home ownership product in their community. It will investigate whether the availability of a homeownership option in the community will contribute to resolving the housing problems in the community. This could include First Nations wishing to use the Loan Insurance Pilot product. The project consultant will recommend a number of First Nations to be part of this project, and will layout a proposed implementation plan based on the individual First Nations chosen. They will work with the community to identify any shortfalls in understanding, knowledge, skill, policy and process, and will provide tools, direction, training, capacity development, guidance, and solutions to the identified problems. The project will document the

ABORIGINAL HOUSING

process followed, highlighting the pitfalls, obstacles to success and opportunities for improvement for First Nations wishing to implement their own program. It will include establishment of a tool kit of resources needed to introduce and implement home ownership programs including such things as:

- i) introducing the home ownership concept to the community;
- ii) determining demand for home ownership; and
- iii) establishing housing management systems.

The results of the project will be highlighted and communicated to client groups via a Research Highlight; a highlight which First Nation communities can refer to in the development of their own program, specifically the pursuit of a functioning housing market via homeownership on reserves.

FEASIBILITY OF COMMUNITY RISK MANAGEMENT AS A SUBJECT FOR CAPACITY BUILDING IN ABORIGINAL COMMUNITIES

The objective of this project is to ascertain what are the components of risk management that are relevant in an Aboriginal community context, and to assess these against pragmatic criteria (as to whether the components can be taught in a capacity development environment and carried out by an Aboriginal community). The following tasks are envisaged: to review text and existing course materials; to determine what materials are relevant; to carry out interviews with risk management professionals and institutes, practitioners, CMHC, Indian and Northern Affairs Canada and other capacity development personnel & Aboriginal groups; to do analysis; and to make recommendations for course content and training methods.

A FIRST NATION GOVERNANCE TOOL: FINANCING HOMEOWNERSHIP THROUGH REVOLVING LOAN FUNDS

This research will examine more closely how some of the barriers to financing for homeownership on reserve may be overcome through instruments that are owned and controlled by First Nations. Based on a comprehensive survey of communities that have implemented a Revolving Loan Fund (RLF), this project aims to:

- 1) perform a broad scanning of First Nation communities in order to document the extent to which communities have developed their own financing techniques, with a focus on RLFs;
- 2) investigate and document the operational requirements and costs of the Band administration to support the RLFs;
- 3) identify possible ways to improve the capacity of existing RLFs to offer low-cost loans for homeownership access, and to leverage financing from private lenders;
- 4) create a critical path leading to the implementation of a RLF on reserve; and
- 5) based on research findings, provide recommendations from a policy and program perspective to the Government of Canada, First Nations, and stakeholders in the housing finance industry.

The resulting research findings will be offered for presentation and discussion at national and/or regional meetings of Chiefs, and other fora as appropriate.

HOW ECONOMIC DEVELOPMENT OPPORTUNITIES CAN BE LINKED TO HOUSING IN FIRST NATION COMMUNITIES

The research will explore how economic development opportunities can be linked to housing in First Nation communities. The research will include five case studies to examine successful approaches implemented and lessons learned by First Nation communities in linking economic development opportunities to housing on reserve. The research will make recommendations on approaches to foster linkages between economic development and housing that is appropriate to First Nation communities. The research will also identify research challenges and suggestions for future research based on past and current research findings. The final report, expected in early 2009, will be of interest to First Nation communities, and federal program and policy officials.

NEIGHBOURHOOD EFFECTS AND LEVELS OF CONCENTRATION FOR ABORIGINAL PEOPLE IN LARGE CITIES IN CANADA

While concerns with the effects of neighbourhoods on life chances have a long history in academic debates, there is no work that specifically considers neighbourhood effects on Aboriginal individuals of living in Aboriginal neighbourhoods in Canadian cities. This paper attempts to provide such a study by investigating the housing patterns of urban Aboriginal people and their relation with socio-economic outcomes, either positive or negative. Housing settlement patterns in the major urban areas of Canada with substantial Aboriginal populations are described statistically, using established indices for spatial distributions of population (evenness, clustering, concentration, centrality and exposure) at different levels of geographic aggregation. The statistics are discussed in terms of the pros and cons of the indices and geographies for each urban centre. The statistics are analysed with a selection of socio-economic census variables chosen for their potential relevance to social and economic outcomes based on research literature.

Prepared by Evelyn J. Peters, Department of Geography, University of Saskatchewan and Oksana Starchenko, Department of Government Relations, Government of Saskatchewan. CMHC Project Manager: Ian Melzer. Ottawa: Canada Mortgage and Housing Corporation, 2008. 75 pages (5867 KB)

PROJECTING ABORIGINAL HOUSING DEFICIENCIES

The proposal is in three parts. One is to use 2001 census data, supplemented by program administration data, to calculate the housing deficiency for the Aboriginal population. The deficiency is based on CMHC's established housing need measures, but measures both the incidence and depth of need, for on- and off-reserve. Through integration of census with program data on-reserve, the deficiency can be translated into a dollar value, giving an estimate of the cost of "correcting" the Aboriginal housing problem. In the other parts, the Aboriginal population is divided into on-reserve and off-reserve respectively and projected over 20 years, using an up-to-date model that incorporates shifts of identity and geography within the overall class of 'Aboriginal'. On reserve where the main issue is inadequate rate of housing supply, current trends in housing stock construction and losses and rates of repair and disrepair will be calculated and superimposed on the household projections to indicate gains or losses in the size of the housing deficiency. Off reserve where the main issue is low incomes, projection is limited to population and household estimates by the four Aboriginal groups, no attempt being made to project the size of the housing deficiency, which would involve forecasting economic and housing market conditions. Instead, off reserve, two separate research ideas will be pursued - calculating income elasticity of demand for Aboriginal homeownership, and investigating the relationship of residential mobility to resolution of housing needs. Projections of the Aboriginal population, households, and families have been completed. Overviews of these projections are being published by Indian and Northern Affairs Canada, who are jointly funding and partnering this initiative.

SMALL FOOTPRINTS ON UNBROKEN LAND / HEALING BROKEN LAND

The project will contribute professional advice and services towards a new First Nation development project located on wild unbroken land in coastal BC and / or on previously used industrial or agricultural broken land. Starting with planning workshops and the development of a community plan, then moving towards establishing a renewable energy platform based on a business plan that establishes a continuous revenue stream, a sustainable development strategy and design solution will be produced for housing construction under Section 95 funding and other recently announced programs to produce 150± homes over 5 years. This will be combined with infrastructure funding from Indian and Northern Affairs Canada, Western Economic Diversification Canada, Natural Resources Canada and Human Resources and Social Development Canada. This project will produce a practical demonstration of sustainable planning, design and development models for rural and remote communities elsewhere in Canada. Fully planned and developed communities, complete with renewable energy systems, road, water, waste water and other essential infrastructure, will occur in several First Nation locations. Development models will be produced that encourage incorporation of sustainability principles and that are built upon economic development and capacity building. The ultimate outcome is 100-150 new homes built by community members in a community planned by the community through workshops and design charrettes.

ABORIGINAL HOUSING

SUSTAINABLE HOUSING IN THE NORTH

The objective of this research is to produce a user-friendly plain language research report that provides a background of “northern” (North of 60) housing in Canada, identifies the types of challenges encountered in northern housing in Aboriginal (Inuit, First Nations, Métis) communities and provides best practice examples of sustainable housing (durable, affordable in construction through use of local materials when possible and in maintenance through provision of energy, water and waste water management at a manageable cost) and sustainable housing components that have proven to be successful in Canada, and in northern countries that have geographic, climatic and resource challenges similar to those in northern Canada and which may be used, or adapted for use, in Canada. The project will be completed by December with a report available in early 2009.

COMPARING CANADIAN NEW-URBANIST AND CONVENTIONAL SUBURBAN NEIGHBOURHOODS

This study will gather and compare data from new-urbanist developments and conventional suburban developments to determine if key objectives of these developments have been realized. Variables to be examined include: car usage for weekday urban travel; access to daily destinations; pedestrian connectivity; housing choice; compactness; occupant satisfaction (e.g. pedestrian safety, aesthetic qualities); access to useful public open/green space; and interaction. The study will derive lessons learned about various neighbourhood design features and how well they achieve key objectives. Four new-urbanist developments and four comparable conventional suburban developments have been chosen and surveyed, and an interim report has been submitted and reviewed. Data analysis is complete and the draft final report has been submitted and reviewed and the final report will be completed in 2008.

AFFORDABLE HOUSING INITIATIVE EVALUATION PLAN

The Affordable Housing Initiative (AHI) was announced in 2001 as a collaborative initiative between the federal and the provincial and territorial governments. The Initiative was implemented under The Framework for Bilateral Agreements Aimed at Affordable Housing (November, 2001). This is a multilateral framework agreed to by federal, provincial and territorial housing ministers that sets out the parameters of bilateral F/P and F/T Affordable Housing Program Agreements (AHPAs). Under these agreements, the provinces and territories determine priorities for funding and design and deliver the programs within agreed parameters.

The federal government has allocated \$1 billion in funding for the AHI, and provincial and territorial housing agencies and other contributors are expected to bring total expenditures to at least \$2 billion.

The accountability frameworks attached to the bilateral Affordable Housing Program Agreements stated that CMHC is responsible for leading a Canada-wide evaluation of the AHI, and that the provinces and territories will be invited to participate in the design and conduct of the evaluation. In Quebec, the SHQ will evaluate its affordable housing activities and provide related information to CMHC for the Canada-wide evaluation report.

The two key purposes for this evaluation are

- 1) to report on the relevance, success, and cost-effectiveness of the two phases of AHI expenditure and
- 2) to inform decisions about whether to continue or modify the initiative or to let it lapse.

The evaluation plan provides a description of the AHI and its logic and outlines evaluation issues, data sources and analytical methods to be used. An evaluation timetable is included.

AFFORDABLE HOUSING STUDY FOR THE CITY OF ST. JOHN'S

The City of St. John's, through its Planning and Housing Standing Committee, sponsored an Affordable Housing Study. An Advisory Committee, chaired by Councillor Shannie Duff, was established to oversee the study. The purpose of the study was to:

1. identify the current supply and scope of affordable housing in St. John's;
2. consider the changing demand for affordable housing based on demographic and other trends with forecasts of housing requirements;
3. comment on the capacity of the City and that of other stakeholders to respond to this demand;
4. define the role of the City and its responsibilities in the development and delivery of affordable housing along with that of other stakeholders; and
5. develop an Action Plan for Affordable Housing for the period to 2016.

This report and Action Plan for affordable housing in St. John's arises from the information collected during the study phase including the assessment of the existing portfolio as contained in the separate Background Report, interviews and consultations with clients and stakeholders, research and analysis. This report was undertaken in partnership with the City of St. John's, Service Canada, and CMHC.

BARRIERS AND OUTCOMES IN THE HOUSING SEARCH FOR NEW IMMIGRANTS AND REFUGEES: A CASE STUDY OF BLACK AFRICANS IN TORONTO'S RENTAL MARKET

While Toronto is Canada's traditional main "port of entry" for new immigrants as well as the country's largest and most culturally diverse city, it is also one of the most expensive housing markets in Canada. Studies have found that new immigrants to Canada are likely to face the greatest affordability problems in this housing market.

This study looked at three groups of Black, Portuguese-speaking immigrants and refugees – from the former Portuguese African colonies of Angola, Mozambique and the Cape Verde Islands – who arrived in Toronto between 1990 and 2006. The key questions in this study were: What barriers do these groups face in the private rental housing market? Does race or skin colour matter in looking for and locating rental housing in Toronto?

The two-part research strategy consisted of a literature review and a questionnaire survey that was administered in Toronto to immigrants and refugees who were born in Angola, Mozambique and Cape Verde Islands.

COMPETITIVE COST AND PERFORMANCE STUDY IN FRANCE

The purpose of this project is to conduct a study on building costs, energy consumption and acoustic properties comparing traditional French construction to Canadian wood-frame technology. The goal is to compare the R-2000/Super-E standards to standards used in France, including future standards like RT-2005/RT-2010, and to analyse total costs attached to the Canadian housing system compared with traditional construction and other wood construction available in France. The costs will include building costs, energy costs, transportation costs and other costs to arrive at a global perspective. If possible, comparisons with standards used in other French speaking countries will be added. The project outcome will be a study report and a specification sheet for a typical Canadian housing system to be used by CMHC and Canadian manufacturers.

DISTRIBUTION AND BUILDER RESEARCH IN SELECTED U.S. MARKETS

The project will study distribution channels and builder buying preferences for specific products in some areas of the United States. The focus for this project will be Middle Atlantic and South Atlantic regions of the U.S. Other areas could also be included in the study. Distribution for the following products will be examined: insulation, solar panel, high-end roofing, and windows. Builder buying preferences will be studied for staircase and millwork. The project outcome will be market intelligence reports for specific building products and U.S. Regions.

EXPORTING TO RUSSIA: LESSONS LEARNED FROM THE CANADIAN HOUSING INDUSTRY PROJECT

The objectives of this project are:

- to identify needs, challenges, and opportunities in the Russian housing market;
- to investigate the operational experience of Canadian housing exporters in Russia;
- to identify export barriers, business opportunities and the challenges facing Canadian housing exporters in Russia;
- to identify key success factors employed by Canadian housing exporters in Russia;
- to assess the comparability between the requirements of the Russian housing market and the capabilities of the Canadian housing industry; and
- to assess CMHC's past role in assisting the Canadian housing export industry to market effectively in Russia.

HOUSING FINANCE

CANADA MORTGAGE BONDS PROGRAM EVALUATION: FINAL REPORT

This is a detailed evaluation report on CMHC's Canada Mortgage Bond (CMB) program. Under this program, bonds are issued to investors by the Canada Housing Trust (CHT), with the guarantee of the Government of Canada, as provided through CMHC, of the full and timely payment of the bonds' interest and principal.

The report found that the CMB program has benefited financial institutions and home buyers across Canada by lowering the cost of mortgages, and has played a stabilizing role in the Canadian housing market.

Overall, the CMB program evaluation found that the original reasons for starting the CMB program are still valid and that the objectives during its first five years have been met. From 2001 to the end of 2006, \$97.6 billion in CMB were issued. By the end of 2006, the program was saving Canadian mortgage borrowers up to \$174 million per year, and from 2001 to 2006, the savings have been as much as \$400 million.

Other key findings of the evaluation report show the CMB program:

- provided lower cost mortgage funding to financial institutions;
- resulted in savings to mortgage borrowers;
- increased the availability of mortgage funding to smaller lenders; and
- provided a way for investors to access capital markets for residential mortgage funding.

The evaluation was conducted by CMHC in consultation with Department of Finance, the Bank of Canada and Treasury Board and with the assistance of external consultants.

Prepared by KPMG LLP. Ottawa: Audit and Evaluation Services, Canada Mortgage and Housing Corporation, 2008. 123 pages.

IMPACT OF BUSINESS CYCLES ON CORE HOUSING NEED

This project will provide policy makers and researchers with an understanding of the impact of various changes in economic conditions on housing need. This project will also help policy makers understand the potential cyclical aspects of housing need, and understand, for example, how policy responses to an increase in housing need caused by a temporary surge in unemployment is different from an increase in housing need caused by persistent increases in housing and related costs, such as interest rates, utility rates and property taxes. This project will therefore decompose changes in housing need into portions attributable to cyclical factors and those attributable to structural considerations.

LIFE CYCLE COSTING TOOL FOR COMMUNITY INFRASTRUCTURE PLANNING

There has been much debate in recent years about the costs of development, both in terms of the true costs of different development forms as well as how the costs of development are shared between the public, the private sector and the environment. There is mounting evidence that more compact, mixed-use development is a more cost-efficient and environmentally sustainable form of development than low-density suburban development. However, there are very few readily available tools to demonstrate the degree to which this is true or to effectively compare different types of development.

This research resulted in the development of a user friendly "Life Cycle Costing Tool for Community Infrastructure Planning" (the Tool) as a method for establishing the long-term costs of alternative planning approaches. The Tool was created to allow a user to estimate the major costs of community development, particularly those that change with different forms of development (for example, linear infrastructure), and to compare alternative development scenarios. The Tool is geared towards estimating planning level costs and revenues associated with the residential component of a development, although financial impacts of commercial and other types of development can be incorporated provided that infrastructure requirements are specified correctly. The Tool is well suited to assessing development projects ranging in size from a collection of houses to a block-by-block infill development to an entire subdivision. A good measure of the applicability of the Tool to a given project is whether or not alternatives can be conceived that would result in significantly different densities or infrastructure requirements, or make use of different green infrastructure alternatives. The Tool is only available as a free download from CMHC's website at:

<http://www.cmhc-schl.gc.ca/en/inpr/su/sucopl/licycoto/index.cfm>

A User Guide provides guidance on all aspects of Tool operation from installation, to development of scenarios, to outputting results, to viewing internal calculations and conducting further analysis. The Guide can be read from cover to cover or can be referred to as specific questions arise. This product is only available as a free PDF download from CMHC's website at

<http://www.cmhc-schl.gc.ca/en/inpr/su/sucopl/licycoto/index.cfm>

LAND DEVELOPMENT

PROFILE OF THE LAND DEVELOPMENT INDUSTRY IN CANADA

The key objective of this study is to develop a profile of the land development industry in Canada. Critical to achieving this objective is gaining a clear understanding of what the land development industry is. To accomplish this, the research will be based on an examination of data from Statistics Canada and a review of existing literature. The literature review will serve to define land development, including its role in the national economy generally, and the residential construction industry in particular.

A nationwide industry survey will be a central element of the research. Interviews will be conducted in 16 major urban centres. Survey results will be used to identify drivers of change in the land development industry, such as environmental and public policy initiatives, and will also allow the analysis of how the industry has adapted and developed in response to these drivers. The results of the survey will also be used to identify challenges facing the land development industry over the next 10 years.

EFFECT OF SNOW AND ICE ON EXTERIOR RAMP NAVIGATION BY WHEELCHAIR USERS

Winter represents the most difficult season for people with mobility deficits. These difficulties include slips, falls, increased walking effort, and snow-ice wheelchair obstructions. Considering the amount of time Canadians spend in winter, a remarkably small amount of literature exists on non-sporting winter activities. As a result, guidelines and standards for buildings are predominately based on "dry-land" studies. In the case of residential access ramps, anecdotal feedback from wheelchair users identifies problems with winter accessibility due to the snow-ice surface properties.

RENOVATION AND INSPECTION

ESTIMATING THE COSTS AND BENEFITS OF HOME RENOVATIONS TO ACCOMMODATE AGING AND DISABILITY

This project will apply the new CMHC cost-benefit framework, or model, to estimate the costs and benefits of home renovations to accommodate aging and disability relative to long-term care institutionalization. The project will include a national survey, involving personal interviews with at least 250 RRAP-D and HASI program beneficiaries and 200 telephone surveys to generate statistically reliable estimates of the costs and benefits. At least 50 caregivers of program beneficiaries will also participate. Following the conduct of the surveys, the resulting cost and benefits of the renovations will be compared with available data on the cost and benefits of long-term care institutionalization. This project will produce estimates of the costs and benefits, and cost-benefit ratios, of home renovations to accommodate aging and disability. Such estimates would be useful to policy at the Federal/Provincial/Territorial/Municipal levels related to funding such housing renovations and to the health services sector, regarding related support services programs for seniors and persons with disabilities. The societal impact on care giving and the health care sector will be examined.

FEDERAL GOVERNMENT RENOVATION ASSISTANCE EVALUATION PLAN

CMHC renovation programs provide financial assistance to homeowners and landlords to preserve affordable housing and ensure that housing occupied by low-income households meets basic health and safety standards. These programs also assist with home modifications and adaptations to enable low-income seniors and persons with disabilities to live independently in their own home. Thirdly, they help with funding to improve or create shelters for victims of family violence and preserve or create, via conversions from non-residential properties, housing for people who are at risk of homelessness.

Federal investments in renovation programs are delivered by CMHC or via provincial and territorial governments, and are available in all regions of Canada, including First Nations communities. As of the time of program renewal in late 2006, more than 750,000 households had benefited from assistance through the renovation programs since 1973. Indian and Northern Affairs Canada (INAC) delivers renovation programs on-reserve, in addition to CMHC's programs.

RENOVATION AND INSPECTION

The suite of CMHC renovation programs in this evaluation plan are as follows:

- Residential Rehabilitation Assistance Program (RRAP) for Homeowners;
- Rental/Rooming House RRAP;
- Conversion RRAP;
- Emergency Repair Program;
- RRAP for Persons with Disabilities; and
- Home Adaptations for Seniors' Independence.

The evaluation plan provides background information on the programs; reasons for the evaluation; outlines the scope of the evaluation, the issues and methods to be used; and presents a summary of evaluation data sources.

RENTAL HOUSING

AFFORDABILITY CHALLENGES AND RENTAL MARKET DYNAMICS IN SMALL NOVA SCOTIA COMMUNITIES WITH COMMUNITY COLLEGE CAMPUSES

The objective of the work is to understand the capacity of rental markets in small towns in Nova Scotia to provide a range of affordable housing options for residents and for students attending community colleges. The research will focus on Truro, Stellarton, and Port Hawkesbury. The work will consist of a background literature review, market analysis, student profiles, and local resident profiles plus primary research involving stakeholder interviews, student surveys, and focus groups of residents.

BEST PRACTICE GUIDE FOR RESIDENTIAL RENTAL PROPERTY INVESTORS

The objective of this project is to produce the content for a best practice guide for individual residential rental property investors in the Toronto Census Metropolitan Area, a guide which will become a template for developing other city-specific best practice guides for rental property investors. The guide content and accompanying tools will provide detailed information on property acquisition and property management. It will include a profile of the Toronto rental environment and information specific to various property types. This guide will ultimately help raise awareness of the rental investment process and serve as an alternative to outsourcing the management of the properties.

EXAMINE THE FEASIBILITY FOR BROADER APPLICATION OF HARM REDUCTION STRATEGIES TO PROVIDE STABLE HOUSING FOR SUBSTANCE USERS

The CMHC Teleforum focused on strategies for implementing Housing First, an approach which involves integrating Housing First clients in non-profit or private rental buildings that serve a mix of tenants, rather than in buildings dedicated to the target population. Participants heard from experts who have used this Housing First approach for several years. These experts work with homeless people living with significant challenges - including substance use and/or mental health issues. This Teleforum appealed to policy makers at all levels of government and in a variety of organizations, agencies that work with homeless people, health care professionals, and housing providers considering dedicating a portion of units to homeless people. There were over 200 participants from across Canada.

REGULATIONS IN THE RESIDENTIAL CONSTRUCTION INDUSTRY IN QUEBEC AND THEIR EFFECTS ON THE COST OF RENTAL HOUSING

This research will assess the impact of the variety of regulations affecting residential construction in Quebec on the cost of rental housing. The author will conduct a literature search of residential building regulations and interview experts in the housing industry, including building officials in the Ville de Québec, representatives of the Commission de la construction du Québec (CCQ), l'Association de la construction du Québec (ACQ), the Corporation des entrepreneurs généraux du Québec (CEGQ), and several residential builders. The researcher will estimate the costs of residential construction attributed to these regulations, and their effects on housing rents. The project should be complete in 2009.

CASE STUDIES OF SUSTAINABLE GREENFIELD RESIDENTIAL DEVELOPMENTS

The current approach to residential development that consumes open space on the urban fringe for single-detached dwellings on large lots is recognized as neither economically nor environmentally sustainable. This project is to document sustainable ("green") residential development case studies from across Canada so that developers, municipalities, housing professionals, and community groups can learn about success stories and replicate these "green" solutions, where applicable.

IMPACT OF DEVELOPMENT COST CHARGES ON HOUSING AFFORDABILITY

The objectives of this project are to:

- (i) investigate the impact of development cost charges on the price and affordability of housing in Canada;
- (ii) identify the costs and benefits of both infill and new subdivision developments in Vancouver, Calgary, Winnipeg, Toronto, Montreal and Halifax; and
- (iii) quantify the up-front and ongoing costs or benefits of infill and new subdivision development on the residents of the new development, residents of existing developments, the local government and the community at large.

MODELING AND ASSESSING LOWER RAINWATER RUN-OFF IN STRATFORD, ON

This research investigated the relationship between storm water run-off reduction and approaches to street pattern design. The work used a new computerized model for estimating run-off, the Water Balance Model, that calculates run-off quantities based on the hydrological, site and development data. The outcome of this analysis will help inform municipalities and developers of opportunities for run-off reduction using suitable planning components and tools. The analyses show that streets are a critical element in managing rainwater runoff: they are the largest, single impermeable surface element, the most polluting and the most difficult of which to mitigate the effects. Approaches that optimize the road area and maximize open space both private and public, such as the Fused Grid, help retain the water on site.

ADAPTER LE LOGIS POUR PROLONGER L'AUTONOMIE : ÉTUDE DE CAS DE 13 AINÉS FRAGILISÉS EN BANLIEUE DE QUÉBEC

This qualitative research examined the process and experience of adapting the homes of frail seniors living in suburban houses. The researchers looked at the technical and financial assistance received by the senior residents and their perception of the adaptation experience. They also sought the viewpoints of the professionals, such as occupational therapists, architects, architectural technicians and builders, involved in the home adaptation process.

This research project attempted to answer the following questions:

1. What are the factors that trigger home adaptations?
2. What financial and technical assistance is available for home adaptations?
3. What are the steps involved in a typical adaptation project under the province of Quebec universal assistance program?
4. What are the most common adaptations for single-family houses?
5. What is the perception of frail seniors and their relatives of the home adaptation process?
6. How satisfied are the individuals with the adaptations?

Senior residents were unanimous in saying that the adaptations improved the comfort and quality of life for themselves and their family members. They felt safer, with the risks of falls and injuries considerably reduced.

ADAPTING YOUR HOME TO LIVING WITH DEMENTIA

An estimated 364,000 Canadians over the age of 65 have some form of dementia. Each person experiencing dementia faces challenges that potentially compromise their safety and quality of life at home. This study provides information about dementia, its symptoms, and common problems that impact every day activities of people with dementia and their caregivers. The study also suggests strategies that can help people with dementia to continue to live safely in their home for as long as possible.

ASSESSING THE IMPLICATIONS OF POPULATION AGING ON THE EXISTING HOUSING STOCK: IMPLICATIONS OF POPULATION AGING FOR REAL HOUSING PRICES

Population aging is a trend that will accelerate in Canada in the next two decades with the aging of the baby boom generation. The goal of this research is to study the effects of population aging on real housing prices in Canada. The project includes a review of the Canadian and the international literature on the effects of demographic changes on real housing prices and the development of an econometric model of these effects for Canada. The model will be used to project real housing price changes in Canada and in each province for the next 20 years under different scenarios.

DETERMINING THE IMPLICATIONS OF THE AGING OF THE CANADIAN POPULATION FOR HOUSING AND COMMUNITIES

The objective of this project is to examine the specific implications of the aging of the Canadian population for housing and communities. The research will be based on existing data and literature, new practical information from experts and key informants in communities, and case studies of communities that have already reached the proportions of seniors that Canada is expected to have over the next 30 years. The emphasis will be on identifying the challenges and opportunities for planning, designing and managing communities (i.e. cities, small towns and suburbs) with increasing older populations. While the project will deal with a range of issues, the main focus will be on urban form and housing. Other related issues, such as transportation, will have a secondary focus.

REGULATING SUPPORTIVE HOUSING FOR SENIORS: A COMPREHENSIVE STATUTE MODEL

Provinces across Canada are currently addressing the need to develop supportive housing for seniors and, as a necessary corollary to that need, development of a regulatory framework. Effective regulation in this sector must protect the rights and interests of residents without replicating the maximum legislated standards that apply to care facilities or nursing homes. The appropriate balance is difficult to achieve. Previous research carried out by the applicant researcher indicated that a comprehensive statute provided the most workable model for regulation in this area. The proposed project would build on that work to create a model comprehensive statute that would include provisions affecting the necessary balance. The model statute and accompanying report would serve as a useful tool for policy makers working in this area.

SMART GROWTH, LIVABLE AND SUSTAINABLE COMMUNITIES FOR SENIORS

This research investigated the relationship between smart growth concepts and the creation of livable and sustainable communities that would facilitate aging in place. Based on the findings of a literature review and focus groups with seniors, the researchers developed a set of indicators to measure the extent to which a community's built environment benefits seniors' health, quality of life, and well-being. The researchers interviewed 30 planners and other experts who provided feedback on the indicators and helped to refine them. After conducting a pilot test with two communities to gather feedback on the utility of the indicators and the availability of the data required to support their use, the researchers incorporated this information to develop a revised set of indicators. Local planners can use these indicators as a tool for setting goals related to the built environment needs of an aging population and for tracking progress against those goals.

UNDERSTANDING THE SMART GROWTH GAP

This project will investigate the reasons for the gap between stated municipal policy objectives, which align with the goals of Smart Growth, and the results on the ground. It will aim to answer the following questions:

- What prevents the accomplishment of set goals?
- Are the goals inherently unachievable?
- What are the expected impacts of Smart Growth practices under a normal positive scenario?
- What time lines can be speculated or calculated for prescribed outcomes?
- What strategies are deemed most effective with respect to the level of impact?

The intent of this research is to enable local governments and industry to lay out a strategy that will produce sustained positive outcomes with predictable beneficial effects for the environment and for the well-being of community residents.

URBAN TRANSPORTATION

ASSESSING TRAVEL AND ENVIRONMENTAL ASPECTS OF THE FUSED GRID

This research project investigated the relationship between street network type and travel behaviour. The focus was on testing the performance of the 'Fused Grid' street network design, using empirical measures of micro-scale street environment and travel survey data. Of particular interest is whether street networks that approximate the Fused Grid (high connectivity for non-motorized modes with disconnected routing for motor vehicles) actually result in greater non-motorized mode share and reduced motor vehicle use when compared to other street network types. Results suggest that the relative connectivity of pedestrian and vehicular modes is an important predictor of the choice to walk from home to destinations within a short distance. The study adjusted for socio-demographic and urban form factors (density and land use mix) and concludes that the highest proportion of trips on foot (18%) is observed in areas where it is relatively more direct to nearby retail and recreational destinations on foot than by car. The lowest proportion (10%) of trips occur on foot in places where there is a low degree of pedestrian connectivity. However, the level of

URBAN TRANSPORTATION

vehicular connectivity in these areas does not seem to relate with walking. Interestingly, the study finds that places with both high levels of pedestrian and vehicle connectivity have only about 14% mode share on foot.

ASSESSMENT OF THE TRANSPORTATION IMPACTS OF CURRENT FUSED GRID LAYOUTS: FINAL REPORT

Recognizing that conventional approaches to suburban development are not sustainable, municipalities are re-examining neighbourhood layout and land-use concepts with the goal of replacing car trips with walking, cycling or public transit. This study looks at street layouts and plans needed to facilitate both walkability and the smooth flow of vehicular traffic. It highlights the Fused Grid model, which blends desirable elements of conventional and grid-based street layouts and gives priority to walking and cycling at the neighbourhood scale, while, at the same time, achieves an efficient movement of cars for the longer destinations.

WOMEN AND HOUSING

BUILDING COMMUNITY: THE STORY OF SUPPORTIVE HOUSING FOR YOUNG MOTHERS (SHYM)

This External Research Program research project employs a case study methodology to study supportive housing arrangements and their impacts on tenants. The project is focused on Supportive Housing for Young Mothers (SHYM), a supportive housing program in Halifax, Nova Scotia, and its effectiveness in providing housing and support services to its tenants. Using in-depth interviews with SHYM tenants as well as the Camberwell Assessment of Need, the study aims to shed light on the tenants' experience at SHYM, the short-term and long-term needs that SHYM is addressing, and the sustainability of the programmatic components of SHYM.

SHELTER ENHANCEMENT PROGRAM 2007 EVALUATION PLAN

Canada Mortgage & Housing Corporation (CMHC) has been involved in the development of Canada's shelters to address family violence since the mid-1970s. Many of the earliest shelters were established with financing from CMHC's National Housing Act (NHA) Non-Profit Programs (Special Purpose housing). Since 1988, CMHC has played a key role in the federal Family Violence Initiative (FVI) by significantly expanding the number of shelters across Canada, developing an integrated system of first- and second-stage housing, and enhancing the quality of shelters for abused women and their children through its Project Haven, Next Step and Shelter Enhancement Program (SEP).

The 2007 SEP Evaluation is intended to meet CMHC's reporting requirements under the federal FVI and accountability requirements related to the CMHC Special Initiatives (Renovation) funding. It will provide an updated assessment of the program following revised funding guidelines in 2003. The 2007 evaluation will cover the time period since the previous SEP evaluation (2001/02) up to 2006/07. It will examine SEP funding for both new shelters and for renovations, and all types of projects (for women and their children, youth and men) totalling \$105.7M in federal funding since 2001/02. The 2007 Evaluation will examine the rationale, success and impacts, and cost effectiveness of the Program including assessment of funding for youth and men's shelters as well as for First Nations.

The evaluation plan provides a description of the Shelter Enhancement Program, outlines evaluation issues, methods, indicators and data sources to be used. An evaluation timetable is included.

CMHC RESEARCH REPORT LISTINGS

To provide quick and comprehensive access to CMHC research published on a given topic, the Canadian Housing Information Centre compiles comprehensive listings of housing research produced over a number of years on certain topics. Topics chosen are those for which there is ongoing client interest and/or for which CMHC has published considerable research. To obtain an electronic, faxed or mailed copy of any of the lists below, contact the Canadian Housing Information Centre at: 1-800-668-2642 or e-mail us at: chic@cmhc.gc.ca

Listings available at this time include:

♦ Aboriginal Housing	♦ Acoustics
♦ Affordable Housing	♦ Airtightness
♦ Basements, Foundations and Crawl Spaces	♦ Concrete
♦ Condominiums	♦ Cooperative Housing
♦ Environmental Site Assessment and Contaminated Lands	♦ Healthy Housing
♦ Heating and Ventilation	♦ Homelessness
♦ Housing and Women	♦ Housing Export Opportunities
♦ Housing for Older Canadians	♦ Housing for Persons with Disabilities
♦ Indoor Air Pollution	♦ Infrastructure
♦ Lead	♦ Log Home Construction
♦ Manufactured Housing	♦ Moisture Problems
♦ Mortgages and Housing Finance	♦ Newcomers, Immigration & Settlement
♦ Northern Housing	♦ Rental Housing
♦ Residential Construction Waste	♦ Residential Renovation
♦ Self Help Housing	♦ Social Housing
♦ Straw Bale Housing	♦ Sustainable Development
♦ Water Conservation, Reuse and Management

65023	CE63a	<p>Accessible Housing by Design - Ramps (Large Print)</p> <p>For anyone who needs to make their house accessible to someone who uses a wheelchair or other mobility device, this About Your House sheds light on the design and construction of ramps for the home. After reading this publication, you will understand how a ramp should be built, the materials that should be used and things to take into consideration before building a ramp for your home.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception - Les rampes d'accès (à gros caractères)</p>

ABOUT YOUR HOUSE SERIES

Order no.	Series no.	Title
65080	CE63b	<p>Accessible Housing by Design - Appliances (Large Print)</p> <p>The design of an appliance can make it very easy or very difficult to use. If you have a disability, limitations in an appliance's design can make it almost impossible to use. Using the principles of Universal Design, this About Your House will help you select an appliance by outlining important design considerations, making helpful suggestions and explaining the safety features of appliances.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception — les appareils (à gros caractères)</p>
65542	CE63c	<p>Accessible Housing by Design - Lifts & Residential Elevators</p> <p>Residential lifts and elevators can benefit many people— particularly seniors who want to remain in their homes despite a loss of mobility, strength or agility. This About Your House tells you about the types of residential lifts and elevators that are commonly available in Canada. It also tells you about some of the things you should consider when you choose and install an elevator or lift in your home.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception - élévateurs et ascenseurs résidentiels</p>
65544	CE63d	<p>Accessible Housing by Design - Residential Hoists and Ceiling Lifts</p> <p>A residential hoist or ceiling lift can help people who have difficulty safely moving themselves or others in or out of bed, or in or out of a bathtub. This About Your House tells you about the types of residential hoists and ceiling lifts that are commonly available in Canada. It also tells you about some of the issues you should consider when you choose and install a hoist or ceiling lift in a house, condominium or apartment.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception - les lève-personnes résidentiels</p>
65588	CE63e	<p>Accessible Housing by Design - Kitchens</p> <p>A home designed and constructed to reflect the principles of Universal Design is safer and more accommodating to the diverse range of ages and abilities of people who live in and visit this home. This About Your House discusses the Universal Design kitchen, which considers efficient design, efficiency of effort, adaptability, ease of cleaning, audibility and safety in order to provide a comfortable and safe space for all family members.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception - les cuisines</p>

ABOUT YOUR HOUSE SERIES

Order no.	Series no.	Title
65686	CE63f	<p>Accessible Housing by Design: Bathrooms</p> <p>A bathroom designed and constructed according to the principles of universal design should be comfortable and safe for all family members, regardless of age or ability. This About Your House outlines the design considerations and elements of a universally designed bathroom, from manoeuvring space and ease of cleaning to grab bars and walk-in bathtubs and showers.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception - salle de bains</p>
65889	CE63g	<p>Accessible Housing by Design: Home Automation</p> <p>The use of technology and automation in the home can help create living spaces that are convenient and energy efficient, that minimize the potential for accidents, and result in a house that is able to adapt to life's changes. Home automation provides many benefits to people with physical, sensory and mental disabilities, allowing them to live more independently. This AYH describes systems and devices that can control elements of your home environment . lighting, appliances, telephones, home security and mechanical, entry and safety systems . resulting in an environment that is more accommodating to everyone who lives there or visits, regardless of age or physical ability.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception - Domotique</p>
66091	CE63h	<p>Accessible Housing by Design: Fire Safety for You and Your Home</p> <p>People with disabilities and seniors are more likely to be injured in a fire than the general population as they are often unable to evacuate independently and quickly, and are not prepared with a fire safety plan. This About Your House provides many quick and easy steps that you can take to prevent fires in your home and plan for fire and emergency situations and minimize accidents ensuring that your home occupants, especially people with disabilities and seniors family are safe.</p> <p>Aussi disponible en français sous le titre : Une habitation accessible dès la conception - la sécurité-incendie pour assurer votre protection et celle de votre habitation</p>
65009	CE65	<p>Garden Suites</p> <p>With municipal approval, a garden suite is a self-contained unit, set on relative's property with an existing single family house. This publication provides introductory information on garden suites for seniors or persons with disabilities.</p> <p>Aussi disponible en français sous le titre : Les pavillons-jardins</p>

65548	CE70	<p>EQilibrium: Healthy Housing for a Healthy Environment</p> <p>CMHC's EQilibrium housing initiative is a powerful new movement in sustainable housing. It can help homeowners reduce their energy bills, protect their families' health, reduce greenhouse gas emissions, and keep the environment clean for generations to come.</p> <p>Aussi disponible en français sous le titre : Equilibrium : maison saine pour un environnement sain</p>

ABOUT YOUR APARTMENT SERIES

Order no.	Series no.	Title
63419	AE1	<p>Solving Odour Transfer Problems in Your Apartment</p> <p>One of the most common problems experienced by the occupants of apartment buildings is the transfer of objectionable odours from one apartment to another. Tobacco smoke and cooking odours top the list of complaints. This fact sheet explains how odours are transferred, and offers a number of potential solutions. Some are very easy to implement and others should be done with the agreement of the building management. Some are trial and error. Solving the problem can take perseverance.</p> <p>Aussi disponible en français sous le titre : Enrayez la transmission d'odeurs dans votre appartement</p>
63904	AE2	<p>Reducing Noise in Your Apartment</p> <p>This article provides basic information about the behaviour of sound and noise and suggests ways to improve the peace and tranquility in your apartment or condominium.</p> <p>Aussi disponible en français sous le titre : Atténuation du bruit dans votre appartement</p>
65013	AE3	<p>Dealing with Power Outages</p> <p>Lengthy power outages rarely occur in Canada, but when they do, they can affect your comfort and safety. This fact sheet, intended specifically for occupants of multi-unit residential buildings, will help you plan ahead for, and deal with, power outages in your apartment building. Topics include, amongst others, contents of an emergency kit, use of alternate power, and summer and winter power failures.</p> <p>Aussi disponible en français sous le titre : Les pannes de courant</p>

ABOUT YOUR APARTMENT SERIES

Order no.	Series no.	Title
65050	AE4	<p>Fire Safety</p> <p>Each year, many Canadians are injured or die in house or apartment fires. This fact sheet, intended specifically for occupants of multi-unit residential buildings, offers practical fire prevention tips and important information regarding smoke alarms. It will also help you create an escape plan for you and your family, and instruct you on what to do should a fire occur in your apartment.</p> <p>Aussi disponible en français sous le titre : La sécurité-incendie</p>
65041	AE5	<p>Improving Your Security and Safety</p> <p>This About Your Apartment fact sheet, intended specifically for occupants of multi-unit residential buildings, provides practical advice on how to protect yourself, your family, and your belongings. It highlights the types of security and safety features you may have in your building and how to use them effectively. Topics include, amongst others, proper locks for windows and doors, neighbourhood security, preventing falls from windows and balconies, combustion safety, and carbon monoxide.</p> <p>Aussi disponible en français sous le titre : Pour une meilleure sécurité chez soi</p>
65297	AE6	<p>Dealing with Pests</p> <p>Most people can relate to the surprise, shock and revulsion of coming across pests in their homes. This fact sheet, intended specifically for occupants of multi-unit residential buildings, will help you prevent and reduce infestations in your apartment by describing how insects enter homes and what they need to survive. Topics include pest proofing your apartment, Integrated Pest Management (IPM), and health concerns associated with pests and pesticides.</p> <p>Aussi disponible en français sous le titre : La lutte contre les parasites</p>
66002	AE7	<p>The Tenant's Guide to Mold</p> <p>This fact sheet is intended for people living in rented apartments and offers practical information on mold problems beginning with an overview of mold and its causes, why it is a concern, and how to identify a mold problem and estimate its severity. Since it was written with renters in mind, this guide discusses tenants' versus landlord's responsibilities when a mold problem is discovered, and whether you should call on professional help or insist that your landlord do so. Other topics addressed include cleaning up mold, preventing mold, mold-proofing different rooms and selecting an apartment that is not moldy.</p> <p>Aussi disponible en français sous le titre : Guide sur la moisissure à l'intention des locataires</p>

ABOUT YOUR HOUSE SERIES

ABOUT YOUR HOUSE - NORTH SERIES

VOTRE MAISON - DOSSIER DU NORD

The North About Your House series is a series specifically designed around day to day northern solutions as well as innovative northern models of building practices which work under cold climate conditions. In this series you will find examples of how to use structural panels in the high arctic, means to cleanse wastewater in the North as well as demonstrated ways of constructing a roof which can withstand northern conditions and how to choose a foundation system which will work in any of the northern communities.

Order no.	Series no.	Title
