## September estimate of production of principal field crops

- Prairie farmers reported decreases in all major grains when compared to 2008, with the exception of spring wheat in Manitoba. In eastern Canada, Quebec and Ontario farmers reported potential increases in soybean production, with a possible record in Quebec.

# Analysis

---

## September estimate of production of principal field crops

Prairie farmers reported decreases in all major grains when compared to 2008, with the exception of spring wheat in Manitoba. In eastern Canada, Quebec and Ontario farmers reported potential increases in soybean production, with a possible record in Quebec.

The 2009 harvest is well under way with mainly dry and mild weather conditions across the country. Less than desirable summer growing conditions have held back crop advancement and more time is needed to bring the crop in. However, reported yields for most crops were higher than those reported in the preliminary production survey taken at the end of July.

Corn and soybean crops in Ontario and Quebec are maturing late this year and require warm and dry weather until October.

### Canola production should fall

Prairie farmers reported that canola production is expected to fall 18.9% from 2008 to 10.2 million tonnes, the result of lower harvested area and yield.

Decreases were reported in all three Prairie provinces, with the largest volume and percentage decline found in Alberta where farmers expect to harvest 35.8% less canola this year. The estimated production of 2.8 million tonnes would be the lowest production amount for Alberta since 2003.

### Feed grain production should fall

Production of barley, oats and dry field peas are expected to be down in all Prairie provinces, the result of declines in yield and harvested area.

Prairie production of barley should fall 23.8% to 8.5 million tonnes, while oat production could drop 36.4% to 2.5 million tonnes. Field pea production should also decline by 11.5% to 3.2 million tonnes.

### More soybeans in Quebec and Ontario

Farmers in Quebec and Ontario reported increases in soybean production, the result of record harvested areas in both provinces.

Soybean production in Quebec could reach a new high of 610,000 tonnes, eclipsing the previous high set in 2008 at 600,000 tonnes. Ontario soybean production should rise by 6.0% to 2.6 million tonnes, the highest production estimate since 2006.

## Crop categories

---

Definitions of the crop categories referenced in Report No. 7, Field Crop Reporting Series are listed below.

**Major grains:** wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

**Coarse grains:** oats, barley, rye, corn for grain and mixed grains.

**Oilseeds:** canola, flaxseed and soybeans.

**Major special crops:** lentils, dry field peas, mustard seeds, Canary seeds, sunflower seeds and chick peas.

# Methodology and data quality

---

## Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the September crop production estimates is selected.

The target population for the September crop production estimates includes all farms in Canada enumerated in the Census of Agriculture except those on Indian reserves and farms from the Northwest Territories, Yukon and Atlantic region. Institutional farms are also excluded from the target population.

Probability surveys can use two types of sampling frames; list and area. In the September Crop Production Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 14,000 farms is drawn from the list frame for the September Crop Production Survey.

## Data collection

Data collection for the September Crop Production Survey was carried out from September 1 to September 9, 2009.

Data collection for field crop surveys is undertaken using the Computer assisted telephone interview (CATI) system.

## Edit and imputation

With the introduction of the CATI system, it is now possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

## Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 2 to 3%. The remainder of the sample unaccounted for, can be explained by non-contact. Initial sample weights are adjusted (a process called raising factor adjustment) in cases of total and partial non-response.

## Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in

the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

## Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis and consultation with provincial statisticians, before a final estimate is published.

## Revised production estimate

The September crop production estimates contained in this publication are preliminary and as such are subject to revisions once final data are received in the November survey.

The following table contains some statistics which indicate the magnitude and direction of the updates between the September Production Survey and final production estimates. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of the update is indicated by counting the number of years that the preliminary estimate is above or below the final published estimate.

The data indicate, for example, that the preliminary estimates of the September production for wheat are changed by a magnitude of, on average, 3.5% and usually in an upwards direction.

**Text table 1**

### **Magnitude and direction of changes between September and final production estimates, Canada 1998 to 2008**

Crop	Number of years preliminary farms stocks data are revised:		
	Average change	Upwards	Downwards
	percent	number	
Wheat	3.5	7	4
Oats	3.1	4	7
Barley	3.1	4	7
Flaxseed	5.5	4	7
Canola	9.7	11	0
Corn for grain	9.8	10	1
Soybeans	5.9	7	4

## Data quality

The September crop production estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the coefficient of variation (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations would be less than twice the coefficient of variation. This range of values is referred to as the confidence interval. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates do remain within the confidence interval of the survey level indicators. For the September Crop Production Survey, c.v.'s at the Canada level range from 1% to 5% for the major crops.

## Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.
