Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

The following staff members have contributed to this publication:

Suzanne Danis, Serge DesRoches, Michele Lapointe, Sheba Mirza, Jake Purdy, Rosaria Spataro and Leah St.Michael.

This publication was prepared under the direction of:

Highlights

2008 Fruit and Vegetable Survey

Reduced planting area, combined with inclement weather in some regions, resulted in 7.5% lower production of fruits and vegetables in 2008.

In 2008, farmers in Canada planted 543,310 acres of fruits and vegetables, a decrease of 5.8%, or 33,650 acres less than what they planted in 2007. However, the total value of production increased by \$14.7 million from 2007, with total farm-gate sales worthing \$1.4 billion in 2008.

The rise in value was attributed to better value received for fruit. Since 2006, fruit farm gate values are increasing while decreasing for vegetables. Almost all of the production was sold, with about 3% not sold due to spoilage and on-farm use.

Vegetables

Total value received for vegetables was \$651 million in 2008, representing a 2.9% drop across both the processing and fresh markets from 2007. Historically, about three-quarter of the value of vegetables comes from the fresh market sales, while the rest comes from sales to processors, as was the case in 2008.

There were 258,650 acres of vegetables planted in 2008, 9.2% less than in 2007. With the exception of radishes and spinaches which showed some increases, almost all vegetables had less area planted.

Sweet corn still held the most vegetable area in Canada, with over 20% of the planted area. Sweet corn, mainly grown in Ontario and Quebec, has however been experiencing a decline for the past 10 years and this continued in 2008. More than half of sweet corn was processed. Green peas, maintained the second largest area planted holding 14.0% of area in 2008. Green peas were mainly sold in the processing market.

Fruit

The value of fruit in 2008 was \$775 million, an increase of 4.6% from 2007. The increase was driven by the processing market as the fresh market lost some of its value.

Historically, fresh market sales held over half of the fruit value, but this was not the case in 2008 where over half the value came from the processing market. Blueberries, cranberries and vinefera grapes were the fruits that contributed the most to the processing sales.

Total area cultivated for fruits was 284,660 acres in 2008, 2.4% less than in 2007. Blueberries accounted for almost half of the fruit area, followed by apples (17.4%) and vinefera grapes (7.7%). Farmers planted more cranberries and blueberries in 2008, while area for apples decreased due in part to replanting programs in some provinces.

Apples however, did continue to be the fruit most produced and sold in Canada, even with 7.6% less area than in 2007. Apples held over half of fruit production and almost one quarter of fruit value. Apples were grown mainly in Ontario, Quebec and British Columbia.

Provincial shares

Vegetable sales came mainly from two provinces, Ontario and Quebec, which accounted for over 80% of vegetable value. Fruit sales came largely from three provinces, with British Columbia continuing to account for most of the fruit value at 35.3% in 2008. Ontario and Quebec had 29.2% and 23.1% of fruit sales, respectively.

Ontario sales of vegetables fell 2.9% from 2007, to \$283 million in 2008. Tomatoes, carrots, peppers, broccoli and lettuce were vegetables that dropped in value, while value increased for corn, peas, pumpkins and rutabagas and turnips.

Sales of fruit fell 4.0% from 2007 to \$226 million, with almost all fruit losing some value. Apples, grapes and peaches which collectively held over 70% of area, started to lose area to orchard and vineyard transition programs.

Quebec had total vegetable value of \$250 million, a gain of \$2 million from 2007. Vegetables in Quebec are sold mainly fresh. Quebec farmers planted more lettuce, radish and spinach than in 2007.

Fruit value in Quebec was \$179 million, an increase of over \$28 million from 2007. The increase was driven by a 37.1% rise in value in the processing market, due in part to processed cranberries. Quebec farmers also planted more blueberries another antioxidant-rich fruit such as cranberries.

British Columbia fruit value increased by \$20 million from 2007 to \$273 million in 2008. As in other provinces, process fruit increased by 35.1%, while value for fresh fruit decreased by 11.4%. High bush blueberries, cranberries, apples and grapes contributed to most of the value. British Columbia farmers were also showing less area for apples, due in part to replanting programs, and more area was being planted for blueberries, sweet cherries, apricots and cranberries.

Methodology and data quality

Introduction

Throughout the publication, data in some instances have been updated based on more recent information from differing data sources. Revisions have been made to some 2007 commercial production estimates. The contents of this publication represent the most recent information available at the time of printing on selected fruits and vegetables produced in Canada. All data are prepared in consultation with representatives of Federal and Provincial Departments of Agriculture and l'Institut de la statistique du Québec. Current year data are preliminary and will be revised in subsequent publications and on CANSIM.

Current year area, production and value figures are preliminary while historical data are estimated based on more complete market information. Data are generally concerned with total production and take into account wastage, etc. With the availability of market and wastage information the estimates more closely reflect commercial production.

Data shown in this publication are on a crop year basis. In the case of mushrooms and greenhouse tomatoes and cucumbers, however, the data are on a calendar year basis. All value data are those obtained at the "farm gate" and are concerned with returns to growers. Estimates are provided in both imperial and metric units.

Production and value data are provided for the twelve most commercially significant fruits grown in Canada. The production figures for fruit crops refer to marketed production rather than harvested production. Only vegetable crops grown commercially are included: no data are available for fruits and vegetables grown for home consumption.

Survey methodology

The major source of information in this publication is the Fall Fruit and Vegetable Survey, conducted by Statistics Canada. This survey is a sample survey for which the data are collected by telephone. The survey estimates the area planted, area harvested, production and farm gate value for the principal fruit and vegetable crops. For fruit, bearing area is estimated as a subset of the cultivated area and is a sum of the fresh market and processing areas. Areas for the fresh market and for processing are also estimated for all fruit and vegetable crops.

Together with import price data collected by Agriculture and Agri-Food Canada, the survey estimates are used to initiate requests for tariff protection under "Snapback" provisions of the Canada-United States Trade Agreement (CUSTA).

Survey frame

Relative to the Fall Survey of Fruit and Vegetables, the frame includes all Canadian horticultural farms, with the exception of farms producing only mushrooms, potatoes or greenhouse vegetables. These are already covered by other surveys collecting the desired information.

Based on these criteria, the known population of fruit and vegetable farms is 17,036.

Sample selection

The Fall Survey of Fruit and Vegetables is a follow-up to the Spring survey. From the initial sample of 12,804 farms sampled for the Spring occasion, 11,500 farms were sampled again for the Fall occasion because we excluded small farms having only two acres or less in vegetables. This exclusion is taken into account by the estimation process. The known population of fruit and vegetable farms is 17,036. For the purpose of the sample selection, the survey

frame was stratified by province and, within each province, by land area. The farms were homogeneously grouped according to different fruit and vegetable areas in each province.

Data collection

The Fall Survey of Fruit and Vegetables collects information by telephone. Statistics Canada conducted the survey in November and December of 2008 using computer-assisted telephone interviews (CATI).

Response rates

Information was received from 92.9% of the sample. Non-responding units (i.e. no-contacts and refusals) are dealt with by adjusting the initial sample weights. The assumption that the non-responding units are randomly distributed among the sample is used to justify adjusting the initial sample weights.

Edit and imputation

It is possible to implement edit procedures at the time of the interview with the introduction of the CATI methodology. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. For the Fall Survey of Fruit and Vegetables, imputation was used to adjust for incomplete survey answers to the questions of production and farm gate value. The imputation used a trend analysis of the completed questionnaires to generate averages to be used to impute for the missing values.

Sampling and non-sampling errors

The statistics from the Fall Survey of Fruit and Vegetables are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors.

Sampling errors arise because estimates are derived from sample data and not the entire population. These errors depend on factors such as, sample size, sampling design and the method of estimation. An important feature of probability sampling is that, sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Population coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

Estimation

Relative to the Fall Survey of Fruit and Vegetables, the survey data collected are weighted within each stratum in order to produce estimates representative of the population. Weighted historical information is used to take into account small farms being excluded from sampling. Analyses of the top contributors and historical comparisons as well as consultations with the Provincial Departments of Agriculture are performed before a final estimate is published.

Data quality

The estimates from the Fall Survey of Fruit and Vegetables are based on a probability sample of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the coefficient of variation (CV).

Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations with respect to the sample estimates would be less than twice the coefficient of variation.

For the 2008 survey, CV's at the Canada level range from 2.5% to 23.9%. We obtained CV's around 11.2% at the province level. Less commonly reported variables are associated with higher, but still acceptable CV's, usually fewer than 20.0%. Coefficients of variation values for the published data are available upon request and are not included in this publication due to space limitations.

Revision policy

Data for the previous year are presented as final while data for the current year are considered preliminary. Data are presented initially in the June issue of **Fruit and Vegetable Production** (Catalogue no. 22-003-X) and are revised further in the February issue of the publication.

Conversion factors

In some cases data that are received by Statistics Canada are in different units of measurement from those which appear in the publication. The fruit estimates are converted at the following rates:

- 1 bushel of apples = 42 pounds;
- 1 quart of strawberries or raspberries = 1.25 pounds;
- 1 bushel of all other tree fruits = 50 pounds (net weight).

Corn, lettuce and greenhouse cucumber production estimates are converted at the following rates:

- 1 dozen ears of corn = 6 pounds;
- 1 dozen heads of lettuce = 15 pounds;
- 1 dozen greenhouse cucumbers = 13 pounds.

The following metric conversion factors are used in this publication:

- | | |
|------------|--|
| Area | 1 acre = 0.4047 hectare; |
| Production | 1 ton short (2,000 pounds) = 0.9072 tonne; |
| | 1 pound = 0.4536 kg. |

Other sources of information

British Columbia Ministry of Agriculture, Fisheries and Food
The Horticulture Branch provides estimates of fruit and vegetable acreage, production and value, several times a year, as more complete information becomes available.

Ontario Ministry of Agriculture, Food and Rural Affairs
Conducts several surveys and provides Statistics Canada with data for both vegetables and fruits, through their publication "Seasonal Fruit and Vegetable Report".

Institut de la statistique du Québec
Conducts several surveys and provides Statistics Canada with data for both vegetables and fruits.

Greenhouse
Data on the Greenhouse industry is obtained from annual surveys conducted by Statistics Canada.
