CANADA MORTGAGE AND HOUSING CORPORATION

Date Released: Fourth Quarter 2010

New Home Market

Total housing starts recovered in the third quarter

The Kingston Census Metropolitan Area (CMA) total housing starts increased in the third quarter, a reversal of the prior quarter's decline. The growth in total starts between July and September 2010 was mainly due to stronger apartment starts in Kingston

City. After two consecutive quarterly declines, apartment starts showed renewed strength in the third quarter of 2010. As a result of this increase, total housing starts in Kingston have exceeded last year's level, recording a slight year-to-date gain of one per cent.

Despite the increase in apartment construction between July and September, the total number of apartment units started during the first nine months of 2010 still remains

below last year's level. Meanwhile, apartment completions and the number of units under construction have increased significantly in recent months. Consequently, this is bound to weigh on the average rental market vacancy rate in Kingston, which may be why some homebuilders scaled back construction activity during the first half of 2010.

Single-detached construction activity eased in the third quarter

Kingston's single-detached housing starts, which are a better indicator of trends in construction activity because they are less volatile, declined by 21 per cent between July and September 2010 – a decrease that is in line with CMHC's projection. The first half of the year was characterized by strong single-detached construction activity as some sales of new homes were brought forward to avoid the impact of the Harmonized Sales Tax. Consequently, low rise construction activity eased off in the third quarter.

rules that took effect in April. All these factors gave homebuyers (particularly first time buyers) enough incentives to push forward demand into the early part of the year. Therefore, since May 2010, the year-over-year sales figure has been trending down causing the total number of sales activity for the first nine months of 2010 to remain below the 2009 level.

The decline in sales activity this third quarter was experienced across all dwelling types. However, the resale single-detached home activity was down the most compared with the multiple-family segment (which includes semi-detached, row/townhouse and condominiums). While the combined sales for semi-detached, row and condominium existing homes declined by 23 per cent in the past three months, the existing single-detached home segment fell by approximately 47 per cent from the previous quarter.

Balanced market condition continues in the third quarter

Kingston's existing home market has been in sellers' territory since the housing market rebounded in the latter part of 2009. However, the third quarter numbers showed softening resale market as evidenced by the continued drop in the seasonally adjusted sales-to-new listings ratio which has drifted deeper into balanced market territory. Nonetheless, this balanced market classification was not only observed in Kingston but in most major existing home markets across Canada. Essentially, resale homes were sitting on the market for a bit longer than the average number of days recorded in the first half of 2010. In fact, the number of active listings on Kingston's resale market increased to 1,338 units at the end of September. This represents a 5.9-month of supply at the current sales pace, up from a 3.9-month supply at the end of June 2010.

Resale Market

Existing home sales decrease in the third quarter

According to the Kingston & Area Real Estate Association (KREA), the third quarter seasonally adjusted existing home sales were down from the second quarter of 2010. The recent slowdown in housing market activity in both the new and existing home markets was due to expected interest rate hike at the end of June (ending the Bank of Canada's commitment to hold the overnight rate constant) and to a lesser extent changes to mortgage qualifying

Figure 2

Average price growth influenced by strong high-end existing home activity

Easing market conditions across the Kingston CMA have led to moderating house prices in recent months. The seasonally adjusted existing home average price in Kingston declined modestly in the third quarter, following a

strong increase in the second quarter of 2010. Meanwhile, the unadjusted existing home average price in the third quarter increased by 1.5 per cent compared with the third quarter of 2009.

One of the main factors influencing Kingston's average price growth is the shift in the proportion of sales in higher price ranges. Undoubtedly, this

compositional effect may help stabilize the average existing home price in Kingston, particularly at a time of heightened economic uncertainty. In fact, between January and September 2010, the number of existing homes sold at \$400,000 or over increased by 26 per cent from the same time a year ago. This clearly suggests that the high-end homebuyer segment remains active in Kingston.

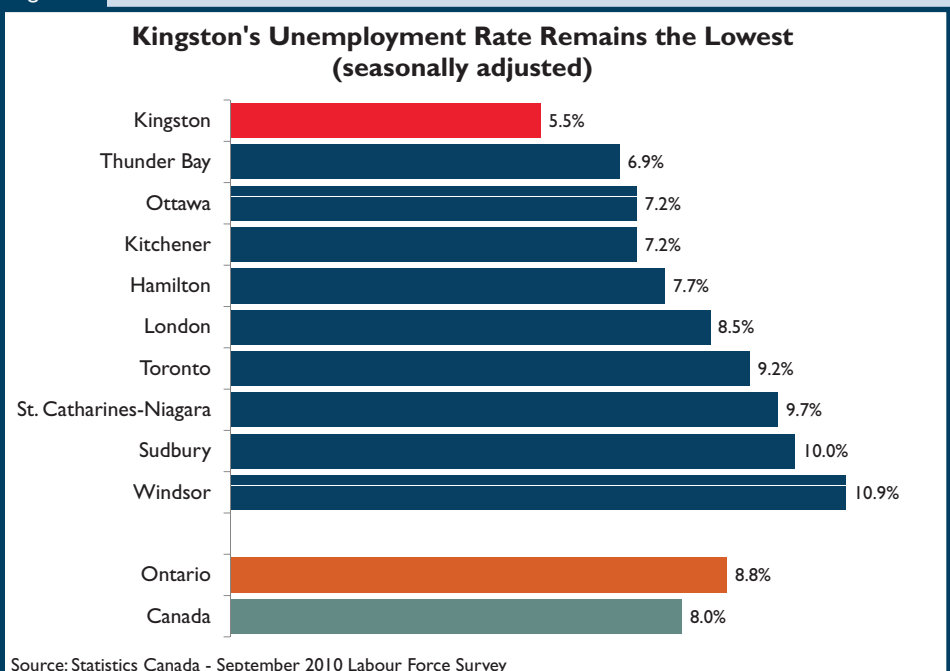

Kingston's unemployment rate remains the lowest among Ontario's CMAs

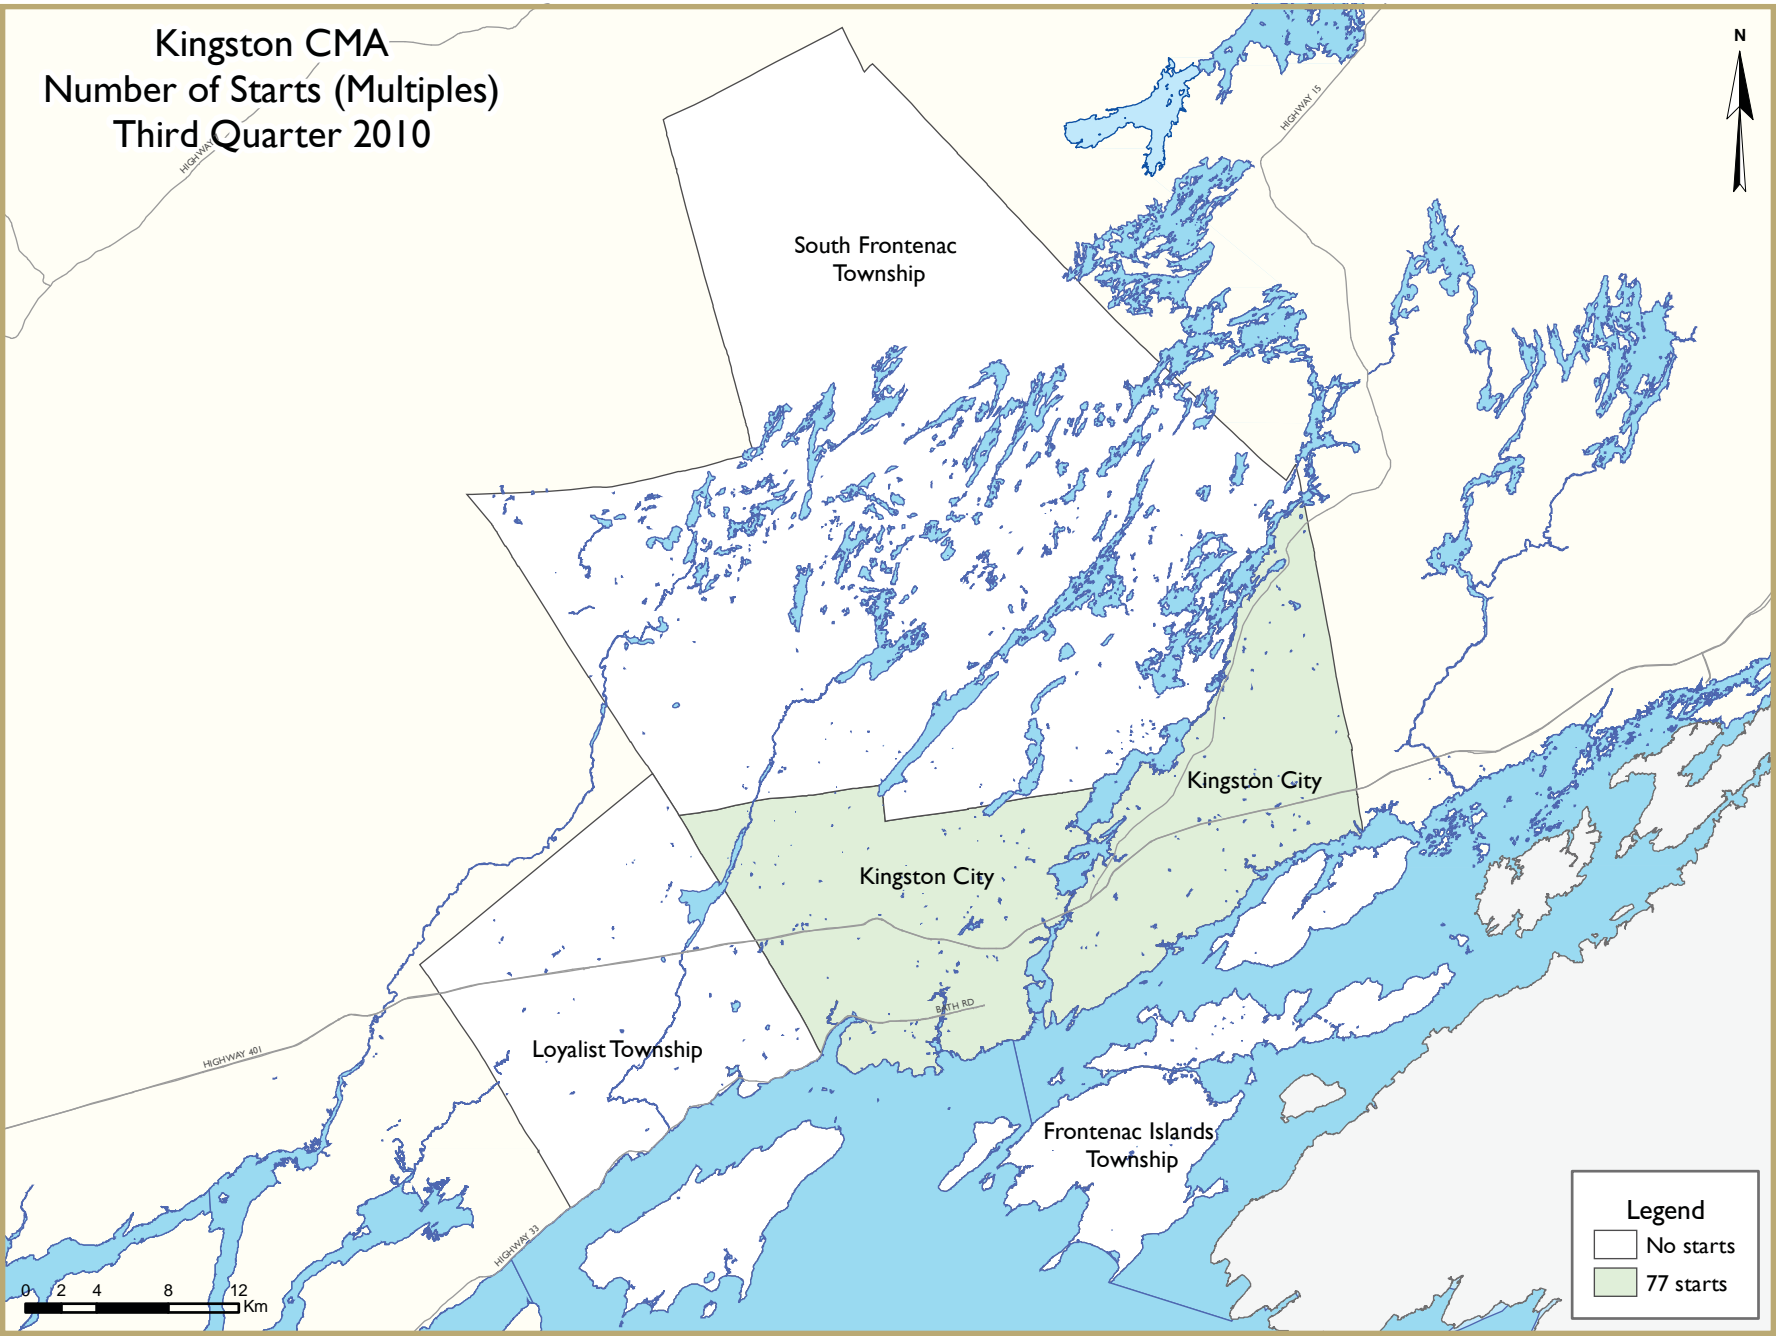

According to the most recent labour force survey data from Statistics Canada, in September 2010, the Kingston CMA registered the lowest unemployment rate among Ontario's major centres, despite concerns about the sluggish global economic recovery. As compared with the unemployment rates across Canada's census metropolitan areas, Kingston and Saskatoon CMAs were tied at fourth position behind Quebec City (4.7%), Regina (4.8%), and Victoria (5.1%).

Meanwhile, the year-to-date full time employment among move-up buyers (aged 45-64) has increased substantially over last year's level. Therefore, this strength in employment among key homebuyer category coupled with relatively low mortgage rates may help sustain a healthy housing market activity in Kingston. As well, the year-over-year growth in Kingston's average weekly earnings has consistently remained above three per

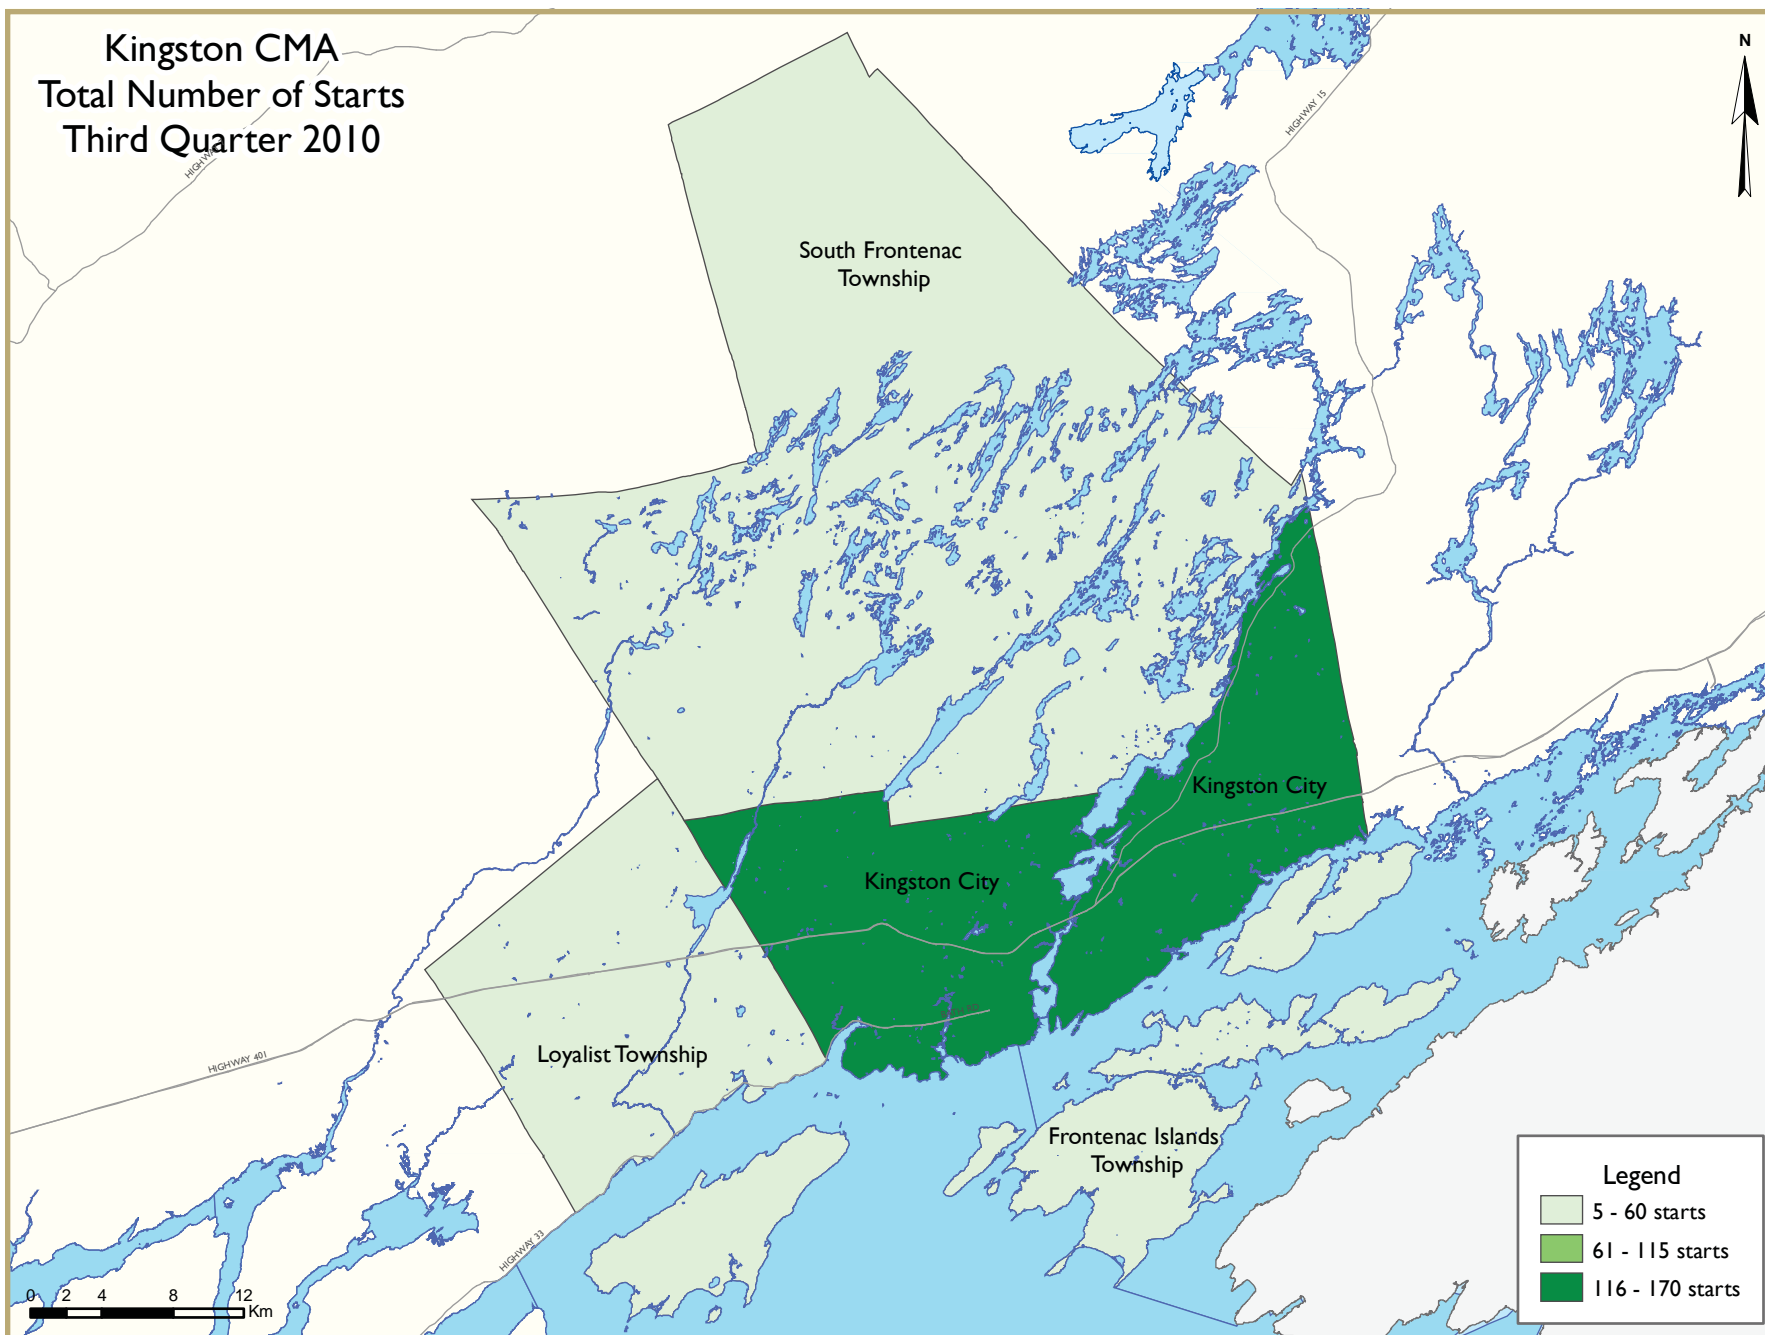

cent since March 2010. In fact, between January and September of this year, the average weekly earnings grew 3.8 per cent from the corresponding period in 2009. This level of growth is well above the current 1.7 per cent national rate of inflation.

METHODOLOGY

Starts & Completions Survey Methodology

The Starts and Completions Survey is conducted by way of site visits which are used to confirm that new units have reached set stages in the construction process. Since most municipalities in the country issue building permits, these are used as an indication of where construction is likely to take place. In areas where there are no permits, reliance has to be placed either on local sources or searching procedures.

The Starts and Completions Survey is carried out monthly in urban areas with population in excess of 50,000, as defined by the 2006 Census. In urban areas with populations of 10,000 to 49,999, all Starts are enumerated in the last month of the quarter (i.e. four times a year, in March, June, September and December). In these centres with quarterly enumeration, Completion activity is modelled based on historical patterns. Monthly Starts and Completions activity in these quarterly locations are statistically estimated at a provincial level for single and multi categories. Centres with populations below 10,000 are enumerated on a sample basis, also in the last month of each quarter (i.e. four times a year, in March, June, September and December).

The Starts and Completions Survey enumerates dwelling units in new structures only, designed for non-transient and year-round occupancy.

Mobile homes are included in the surveys. A mobile home is a type of manufactured house that is completely assembled in a factory and then moved to a foundation before it is occupied.

Trailers or any other movable dwelling (the larger often referred to as a mobile home) with no permanent foundation are excluded from the survey.

Conversions and/or alterations within an existing structure are excluded from the surveys as are seasonal dwellings, such as: summer cottages, hunting and ski cabins, trailers and boat houses; and hostel accommodations, such as: hospitals, nursing homes, penal institutions, convents, monasteries, military and industrial camps, and collective types of accommodation such as: hotels, clubs, and lodging homes.

Market Absorption Survey Methodology

The Market Absorption Survey is carried out in conjunction with the Starts and Completions Survey in urban areas with populations in excess of 50,000. When a structure is recorded as completed, an update is also made as units are sold or rented. The dwellings are then enumerated each month until such time as full absorption occurs.

STARTS AND COMPLETIONS SURVEY AND MARKET ABSORPTION SURVEY DEFINITIONS

A “**dwelling unit**”, for purposes of the Starts and Completions Survey, is defined as a structurally separate set of self-contained living premises with a private entrance from outside the building or from a common hall, lobby, or stairway inside the building. Such an entrance must be one that can be used without passing through another separate dwelling unit.

A “**start**”, for purposes of the Starts and Completions Survey, is defined as the beginning of construction work on a building, usually when the concrete has been poured for the whole of the footing around the structure, or an equivalent stage where a basement will not be part of the structure.

The number of units “**under construction**” as at the end of the period shown, takes into account certain adjustments which are necessary for various reasons. For example, after a start on a dwelling has commenced construction may cease, or a structure, when completed, may contain more or fewer dwelling units than were reported at start.

A “**completion**”, for purposes of the Starts and Completions Survey, is defined as the stage at which all the proposed construction work on a dwelling unit has been performed, although under some circumstances a dwelling may be counted as completed where up to 10 per cent of the proposed work remains to be done.

The term “**absorbed**” means that a housing unit is no longer on the market (i.e. has been sold or rented). This usually happens when a binding contract is secured by a non-refundable deposit and has been signed by a qualified purchaser. The purpose of the Market Absorption Survey is to measure the rate at which units are sold or rented after they are completed, as well as collect prices.

DWELLING TYPES:

A **“Single-Detached”** dwelling (also referred to as **“Single”**) is a building containing only one dwelling unit, which is completely separated on all sides from any other dwelling or structure. Includes link homes, where two units may share a common basement wall but are separated above grade. Also includes cluster-single developments.

A **“Semi-Detached (Double)”** dwelling (also referred to as **“Semi”**) is one of two dwellings located side-by-side in a building, adjoining no other structure and separated by a common or party wall extending from ground to roof.

A **“Row (Townhouse)”** dwelling is a one family dwelling unit in a row of three or more attached dwellings separated by a common or party wall extending from ground to roof.

The term **“Apartment and other”** includes all dwellings other than those described above, including structures commonly known as stacked townhouses, duplexes, triplexes, double duplexes and row duplexes.

INTENDED MARKET:

The **“intended market”** is the tenure in which the unit is being marketed. This includes the following categories:

Freehold: A residence where the owner owns the dwelling and lot outright.

Condominium (including Strata-Titled): An individual dwelling which is privately owned, but where the building and/or the land are collectively owned by all dwelling unit owners. A condominium is a form of ownership rather than a type of house.

Rental: Dwelling constructed for rental purposes regardless of who finances the structure.

GEOGRAPHICAL TERMS:

A census metropolitan area (CMA) or a census agglomeration (CA) is formed by one or more adjacent municipalities centred on a large urban area (known as the urban core). The census population count of the urban core is at least 10,000 to form a census agglomeration and at least 100,000 to form a census metropolitan area. To be included in the CMA or CA, other adjacent municipalities must have a high degree of integration with the central urban area, as measured by commuting flows derived from census place of work data. CMAs and CAs contain whole municipalities or Census Subdivisions.

A **“Rural”** area, for the purposes of this publication, is a centre with a population less than 10,000.

All data presented in this publication is based on Statistics Canada’s 2006 Census area definitions, except the Economic Indicators data (Table 6) which is based on Statistics Canada’s 2001 Census area definitions.

CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for more than 60 years.

Together with other housing stakeholders, we help ensure that the Canadian housing system remains one of the best in the world. We are committed to helping Canadians access a wide choice of quality, environmentally sustainable and affordable homes – homes that will continue to create vibrant and healthy communities and cities across the country.
