Highlights

Stocks of principal field crops at December 31, 2009

- As of December 31st, total stocks of most principal field crops were down from previous year levels, with the exception of dry field peas and flax in the West and soybeans in the East.

Analysis

Stocks of principal field crops at December 31, 2009

As of December 31st, total stocks of most principal field crops were down from previous year levels, with the exception of dry field peas and flax in the West and soybeans in the East. Total stocks (including commercial and on-farm inventories) generally fell as a result of reduced crop production in 2009.

Canola stocks down

Total stocks of canola were 8.8 million metric tonnes, a decrease of 389,000 tonnes or 4.3% from December 31, 2008. Canola supplies decreased due to a production decline of 6.5% in 2009.

Commercial stocks rose 26.8% to 1.0 million tonnes while Prairie on-farm stocks were down by 7.0% to 7.8 million tonnes. On-farm stocks in Saskatchewan fell 1.8% and by 25.5% in Alberta. Manitoba on-farm stocks reversed the trend, up 10.6% to a record 1.8 million tonnes. The previous record was 1.6 million tonnes set just last year.

Stocks of wheat excluding durum off

Total stocks of wheat excluding durum stocks (held both on-farm and in commercial positions), decreased by 6.5% to 16.1 million tonnes from December 31, 2008, down to just below the 5-year average of 16.2 million tonnes.

On-farm stocks in the Prairies fell 6.1% to 12.0 million tonnes. On-farm stocks fell in Manitoba and in Alberta, while in Saskatchewan stocks rose 5.1% to 5.2 million tonnes.

Total stocks of feed crops mixed

Total stocks of oats and barley declined, while stocks of dry field peas rose from December 2008.

Total stocks of oats fell 16.6% to 2.8 million tonnes and total stocks of barley declined 11.1% to 7.6 million tonnes, the result of a significant decline in the 2009 harvest.

Total stocks of field peas rose 7.6% to 2.7 million tonnes. On-farm stocks and stocks in commercial positions were all well above the 5-year averages. On-farm stock increases were noted in Saskatchewan and in Alberta.

Stocks of soybeans up, grain corn stocks lower

Total stocks of soybeans were 2.2 millions tonnes, up 9.2% from December 31, 2008, the result of an increase in production in Ontario in 2009. The 5-year average is 2.2 million tonnes.

In Ontario, on-farm stocks rose 21.9% to 975,000 tonnes, while Quebec stocks decreased by 14.6% to 205,000 tonnes.

Total stocks of grain corn were down from December 31, 2008, off 8.3% to 8.6 million tonnes, the result of less production in 2009. The 5-year average is 8.7 million tonnes.

On-farm stocks fell in both Ontario and Quebec. Commercial stocks of grain corn also declined by 2.6%.

1. Grain exports and imports include seed.

Concepts and definitions

Definitions of the crop categories referenced in Report No. 1, Field Crop Reporting Series are listed below.

Stocks on farms: farm held stocks of grains include marketable grain and special crops, reserves for on farm feed, seed use and dockage.

Commercial stocks: stocks of grain held at facilities such as elevators, terminals, mills, etc. Commercial stocks exclude dockage.

Dockage: dockage is material that must be removed from grain in order that the commodity can be assigned the highest grade for which it qualifies.

Major grains: wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

Oilseeds: canola, flaxseed and soybeans.

Major special crops: dry peas, lentils, mustard seed, sunflower seed, Canary seed and chick peas.

Methodology and data quality

Survey frame and sample selection

The target population for the December 31 farm stock estimates includes all farms in Canada enumerated in the Census of Agriculture except those on Indian reserves and farms from the Northwest Territories, Yukon and Atlantic region. Institutional farms are also excluded from the target population.

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the December 31 farm stock estimates is selected.

Probability surveys can use two types of sampling frames, list and area. In the December 31 Farm Stocks Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 11,400 farms is drawn from the list frame for the December 31 Farm Stocks Survey.

Data collection

Data collection for the December 31 Farm Stocks Survey was carried out from January 4 to January 11, 2010.

Data collection for field crop surveys is undertaken using the "Computer assisted telephone interview" (CATI) system.

Edit and imputation

With the introduction of the CATI system, it is now possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 5%. The remainder of the sample unaccounted for, can be explained by non-contact. Initial sample weights are adjusted (a process called raising factor adjustment) in cases of total and partial non-response; no imputation is performed for missing values.

Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis and consultation with provincial statisticians, before a final estimate is published.

Estimates of farm stocks of grains are obtained by a survey of farm operations but a major tool used in the verification of these estimates is the farm supply-disposition (or supply-demand) balance sheet. This table reflects activity ON FARMS ONLY before grain enters the commercial system. The total supply and the disposition must be equal.

The supply is composed of opening farm stocks and production. The disposition is comprised of deliveries, seed use, closing farm stocks and feed, waste and dockage. The production and farm stock data are estimated from large surveys of Canadian farmers. Seed use data are based on average seeding rates.

A major portion of the deliveries are licensed grain deliveries obtained from the Canadian Grain Commission (CGC). Statistics Canada (STC) adjusts these deliveries during the estimation process to account for CGC quality problems and data lags. The adjustments are calculated mainly from commercial supply-demand tables using data available in the CGC publication Grain Statistics Weekly. However, the deliveries published in the STC farm supply-disposition tables reflect the CGC published data plus STC estimates for unlicensed deliveries to both domestic and export markets and to condominium storage.

The feed, waste and dockage (fwd) component is a residual in the balance sheet. Indicators such as the number of grain consuming animal units, harvest conditions affecting grain quality, established ratios of dockage to delivered grain and grain inspections are used to ensure data accuracy. An unusual estimate in this component may indicate a problem with another data series such as deliveries or may show a change in feeding patterns. Farm stocks are estimated from survey indicators in conjunction with the other components of the balance sheet. Therefore, any apparent fwd anomalies are unlikely to reflect problems with the level of the farm stocks.

National supply and disposition tables provide further information to aid in estimating farm stocks. More detailed information on supply and disposition tables may be obtained in the October issue of Statistics Canada catalogue 22-007-X, Cereals and Oilseeds Review.

Revisions

Stocks data are subject to revision for two years after first being published. Any revisions are published in the July 31 stocks report, which is released in September.

The following table contains some statistics which indicate the magnitude and direction of past revisions to the December farm stocks data. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of revisions is indicated by counting the number of years that the preliminary estimate is above or below the final revised estimate.

The data indicate, for example, that the preliminary estimates of wheat farm stocks are revised by a magnitude of, on average, 2.5% and usually in a upwards direction.

Text table 1

Magnitude and direction of past revisions to December 31 farm stocks estimates, Canada 1999 to 2009

Crop	Number of years preliminary farms stocks data are revised:		
	Average change	Upwards	Downwards
	percent	number	
Wheat	2.5	6	4
Oats	6.3	9	1
Barley	0.9	5	4
Flaxseed	2.1	3	2
Canola	3.6	6	3
Corn for grain	0.9	5	3
Soybeans	3.7	6	2

Data quality

The December 31 farm stocks estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the coefficient of variation (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations would be less than twice the coefficient of variation. This range of values is referred to as the confidence interval. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates do remain within the confidence interval of the survey level indicators. For the December 31 Farm Stocks Survey, c.v.'s at the Canada level range from 3% to 10% for the major crops.

For the different types of special crops, the estimates contained in this publication have been assigned a letter to indicate their c.v. (expressed as a percentage). The letter grades represent the following c.v. ranges:

Text table 2

Coefficient variation rating system for special crops

Coefficient variation range	Symbol	Meaning
0.00% to 4.99%	A	Excellent
5.00% to 9.99%	B	Very good
10.00% to 14.99%	C	Good
15.00% to 24.99%	D	Use with caution
25.00% and more	F	Too unreliable to publish

Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

Field crop reporting series calendar

Catalogue 22-002-X

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 hrs, Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: agriculture@statcan.gc.ca

Report no. and title	2010 Release Dates
1 Stocks of principal field crops at December 31, 2009	February 5
2 March intentions of principal field crops areas	April 26
3 Stocks of principal field crops at March 31, 2010	May 10
4 Preliminary estimates of principal field crops areas	June 23
5 July 31 estimate of production of principal field crops	August 20
6 Stocks of principal field crops at July 31, 2010	September 8
7 September estimate of production of principal field crops	October 4
8 November estimate of production of principal field crops	December 3

Cereals and oilseeds review

Catalogue 22-007-X

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.
