Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Highlights

Stocks of principal field crops at March 31, 2010

- As of March 31st, total stocks of principal field crops such as canola, wheat excluding durum, barley and oats were below the same date in 2009. Stocks fell mostly as a result of reduced crop production in 2009. By contrast, total soybean stocks were above levels of one year ago because of augmented production in 2009.

Analysis

Stocks of principal field crops at March 31, 2010

As of March 31st, total stocks of principal field crops such as canola, wheat excluding durum, barley and oats were below the same date in 2009. Stocks fell mostly as a result of reduced crop production in 2009. By contrast, total soybean stocks were above levels of one year ago because of augmented production in 2009.

Total stocks of canola stood at 5.4 million metric tonnes, down 11.6 % or 711,000 tonnes from March 31, 2009. Canola supplies were down as a result of a 6.5% production decline in 2009. Total on-farm stocks were down by 9.8% to 4.5 million tonnes while commercial stocks declined 19.1% to 932,000 tonnes.

Total stocks of wheat excluding durum dropped by 11.5% to 11.1 million tonnes, the result of an 8.6% drop in production in the fall of 2009. On-farm stocks were lowered by 20.6% to 7.3 million tonnes compared to March 31 of 2009 while commercial stocks increased by 13.3% to 3.8 million tonnes.

Total stocks of soybeans reached 1.4 million tonnes, up 14.5% from March 31, 2009. The increase in stocks was due to a record 3.5 million tonne production in 2009.

In Ontario, on-farm stocks of soybeans rose 34.6% to 525,000 tonnes, while Quebec stocks decreased 7.4% to 125,000 tonnes.

1. Commercial stocks include condominium stocks as of December 2003.
2. Grain exports exclude seed.
3. Animal feed, waste and dockage calculated residually.
4. Some durum wheat is blended with other wheats and exported as wheat excluding durum.
5. May include small amount of use by food plants.

1. Grain exports and imports include seed.

Concepts and definitions

Definitions of the crop categories referenced in Report No. 3, Field Crop Reporting Series are listed below.

Stocks on farms: farm held stocks of grains include marketable grain and special crops, reserves for on farm feed, seed use and dockage.

Commercial stocks (or in commercial positions): stocks of grain held at facilities such as elevators, terminals, mills, etc. Commercial stocks exclude dockage.

Dockage: dockage is material that must be removed from grain in order that the commodity can be assigned the highest grade for which it qualifies.

Major grains: wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

Coarse grains: oats, barley, rye, corn for grain and mixed grains.

Oilseeds: canola, flaxseed, soybeans and sunflower seed.

Major special crops: dry peas, lentils, mustard seed, sunflower seed, Canary seed and chick peas.

Methodology and data quality

Survey frame and sample selection

The target populations for the March 31 farm stock estimates include all farms in Canada enumerated in the Census of Agriculture except those on Indian reserves and farms from the Northwest Territories, Yukon and Atlantic region. Institutional farms are also excluded from the target population.

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the March Farm Survey estimates is selected.

Probability surveys can use two types of sampling frames, list and area. In the March Farm Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 13,800 farms is drawn from the list frame for the March 2010 Farm Survey.

Data collection

Data collection for the March 2010 Farm Survey was carried out from March 24 to March 31.

Data collection for field crop surveys is undertaken using the “Computer assisted telephone interview” (CATI) system.

Edit and imputation

With the introduction of the CATI system, it is now possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 8% to 9%. The remainder of the sample unaccounted for can be explained by non-contact. Initial sample weights are adjusted (a process called “raising factor adjustment”) in cases of total and partial non-response. No imputation is performed for missing values.

Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not from the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis and consultation with provincial statisticians, before final estimates are published.

Estimates of farm stocks of grains are obtained by a survey of farm operations, but a major tool used in the verification of these estimates is the farm supply-disposition (or supply-demand) balance sheet. This table reflects activity ON FARMS ONLY before grain enters the commercial system. The total supply and the disposition must be equal.

The supply is composed of opening farm stocks and production. The disposition is comprised of deliveries, seed use, closing farm stocks as well as feed, waste and dockage. The production and farm stock data are estimated from Farm Surveys conducted by Statistics Canada. Seed use data are based on average seeding rates.

A major portion of the deliveries are licensed grain deliveries obtained from the Canadian Grain Commission (CGC). Statistics Canada (STC) adjusts these deliveries during the estimation process to account for CGC quality problems and data lags. The adjustments are calculated mainly from commercial supply-demand tables using data available in the CGC publication *Grain Statistics Weekly*. However, the deliveries published in the STC farm supply-disposition tables reflect the CGC published data plus STC estimates for unlicensed deliveries to both domestic and export markets and to condominium storage.

The feed, waste and dockage component is a residual in the balance sheet. Indicators such as the number of grain consuming animal units, harvest conditions affecting grain quality, established ratios of dockage to delivered grain and grain inspections are used to ensure data accuracy. An unusual estimate in this component may indicate a problem with another data series such as deliveries or may show a change in feeding patterns. Farm stocks are estimated from survey indicators in conjunction with the other components of the balance sheet. Therefore, any apparent feed, waste and dockage anomalies are unlikely to reflect problems with the level of the farm stocks.

National supply and disposition tables provide further information to aid in estimating farm stocks. More detailed information on supply and disposition tables may be obtained in the October issue of Statistics Canada catalogue 22-007X, *Cereals and Oilseeds Review*.

Revisions

Stocks data are subject to revision for two years after first being published. Any revisions are published in the July 31 stocks report, which is released in September.

The following table contains some statistics which indicate the magnitude and direction of past revisions to the March farm stocks data. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of revisions is indicated by counting the number of years that the preliminary estimate is above or below the final revised estimate.

The data indicate, for example, that the preliminary estimates of wheat farm stocks are revised by a magnitude of, on average, 1.3% and usually in an upward direction.

Text table 1

Magnitude and direction of past revisions to March 31 farm stocks estimates, Canada, 1999 to 2009

| Crop | Number of years preliminary farms stocks data are revised: | | |
|----------------|--|---------|-----------|
| | Average change | Upwards | Downwards |
| | percent | number | |
| Wheat | 1.3 | 9 | 1 |
| Oats | 2.7 | 6 | 1 |
| Barley | 0.8 | 4 | 3 |
| Flaxseed | 2.7 | 5 | 1 |
| Canola | 1.8 | 8 | 0 |
| Corn for grain | 0.5 | 1 | 1 |
| Soybeans | 4.1 | 7 | 2 |

Data quality

The March 31 farm stocks estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the “coefficient of variation” (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations would be less than twice the coefficient of variation. This range of values is referred to as the “confidence interval”. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates usually remain within the confidence interval of the survey level indicators. For the March 2010 Farm Survey, c.v.’s at the Canada level range from 3% to 10% for the major crops.

Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.
