## September estimates of production of principal field crops

- Grain and oilseed production in the Prairie provinces was expected to decline for total wheat and for canola in 2010 compared with 2009. In contrast, farmers in Manitoba, Quebec and Ontario reported they expected to harvest a record soybean crop.

# Analysis

---

## September estimates of production of principal field crops

Grain and oilseed production in the Prairie provinces was expected to decline for total wheat and for canola in 2010 compared with 2009. In contrast, farmers in Manitoba, Quebec and Ontario reported they expected to harvest a record soybean crop.

Farmer comments reported that cool and wet conditions delayed seeding in some parts of the Prairies and wet weather in September was reported to be delaying the harvesting of crops. Since the survey was taken, widespread frost has been reported in the Prairies and the resultant effects on final yield and production will be reflected on the November survey.

### Prairie total wheat production down

Farmers expected total wheat production in the Prairies to reach 20.0 million metric tonnes, a drop of 18.5% from 2009. Reported average yield was 38.9 bushels per acre, down 3.0% from 2009.

Manitoba and Saskatchewan farmers foresaw a sharp drop in production of 25.8% and 28.3% respectively, while Alberta farmers expected an increase of 2.6%, the result of a reported increase in yield.

### Canola production should fall

Prairie farmers reported that canola production was expected to fall 16.3 % from 2009 to 10.3 million metric tonnes, as a result of a decline in expected yield.

Decreases in production were expected in Manitoba and Saskatchewan, with declines of 32.2% and 27.2% respectively. In contrast, Alberta farmers expected to harvest the second largest crop in Alberta history at 4.0 million metric tonnes. This was mainly due to a record harvested area of 5.4 million acres.

### Possible record soybean production in Manitoba, Quebec and Ontario

Farmers in Manitoba, Quebec and Ontario reported increases in soybean production to new highs, the result of record harvested areas in each province. Total production for these three provinces has risen steadily since 2007.

Soybean production in Quebec was reported to reach 750,000 metric tonnes, 25% above the previous record of 600,000 metric tonnes set in 2008. Ontario soybean production was expected to rise by 8.1% from 2009 to 2.8 million metric tonnes, the highest production estimate since 2006. In Manitoba, production could rise to 400,100 metric tonnes, 24.6% above 2009.

1. Grain exports and imports include seed.

## Crop categories

---

Definitions of the crop categories referenced in Report No. 7, Field Crop Reporting Series are listed below.

**Major grains:** wheat, oats, barley, flaxseed, canola, corn for grain and soybeans.

**Oilseeds:** canola, flaxseed, soybeans and sunflower seeds.

**Major special crops:** dry peas, chick peas, lentils, mustard seed, Canary seed, sunflower seed, dry white beans, dry coloured beans.

# Methodology and data quality

---

## Survey frame and sample quality

The target population for the September Farm Survey includes all farms in Canada enumerated in the Census of Agriculture except those on Indian reserves and farms from the Northwest Territories, Yukon, Nunavut and Atlantic region. Institutional farms are also excluded from the target population.

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the September Farm Survey is selected.

Probability surveys can use two types of sampling frames; list and area. In the September Farm Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 14,000 farms has been drawn from the list frame for the September 2010 Farm Survey.

## Data collection

The September 2010 Farm Survey was carried out from September 1 to September 9. Data collection is undertaken using the "Computer assisted telephone interview" (CATI) system.

## Edit and imputation

With the introduction of the CATI system, it is now possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

## Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 8 to 9%. The remainder of the sample unaccounted for can be explained by non-contact or non-response. Initial sample weights are adjusted by a process called "raising factor adjustment" in cases of total and partial non-response.

## Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not from the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

## Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis and consultation with provincial statisticians, before final estimates are published.

## Revisions

The September crop production estimates contained in this publication are preliminary and as such are subject to revisions once final data will be received from the November survey.

The following table contains some statistics which indicate the magnitude and direction of the updates between the September production and final production estimates. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of revisions is indicated by counting the number of years that the preliminary estimate is above or below the final estimate. The data indicate, for example, that the preliminary estimates of the September production for wheat are changed by a magnitude of, on average, 3.5% and usually in an upwards direction.

**Text table 1**

### **Magnitude and direction of changes between September and final production estimates, Canada, 1999 to 2009**

Crop	Average change percent	Number of years September production estimates are revised:	
		Upwards	Downwards
	%	number	
Wheat	3.5	7	4
Oats	3.1	4	7
Barley	3.1	4	7
Flaxseed	5.5	4	7
Canola	9.7	11	0
Corn for grain	9.8	10	1
Soybeans	5.9	7	4

## Data quality

The September crop production estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the “coefficient of variation” (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations would be less than twice the coefficient of variation. This range of values is referred to as the “confidence interval”. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates do remain within the confidence interval of the survey level indicators. For the September Farm Survey, c.v.’s range from 3% to 10% for the major crops.

## Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.
