Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published
- * significantly different from reference category ($p < 0.05$)

Highlights

Stocks of principal field crops at July 31, 2011

- As of July 31, total stocks of wheat, barley, oats and canola had declined compared with the same date in 2010.

Analysis

Stocks of principal field crops at July 31, 2011

As of July 31, total stocks of wheat, barley, oats and canola had declined compared with the same date in 2010.

Total stocks of wheat decreased 8.2%, to 7.2 million tonnes, mostly the result of an 18.8% decline in on-farm stocks. Commercial stocks were little changed.

Much of the decline occurred in durum wheat, where total stocks fell 41.5% during the year to 1.6 million tonnes.

Total stocks of barley declined 44.2% to 1.4 million tonnes. Barley production fell in 2010, the result of a decline in harvested area. Declines of on-farm stocks occurred in all four western provinces, but were most pronounced in Manitoba and Saskatchewan.

Total stocks of canola decreased 19.2% to 1.8 million tonnes. This was due primarily to on-farm stocks, which declined by 33.9% to 820,000 tonnes. Despite the decline, total canola stocks remain at the five-year average (2006-2010) of 1.8 million tonnes.

Overall stocks of oats fell 34.3% to 769,000 tonnes. This follows a sharp decline in production of oats in 2010. On-farm stocks of oats were down 37.2%, while commercial stocks fell 24.2%.

1. Grain exports and imports include seed.

Concepts and definitions

Definitions

Stocks on farms: farm held stocks of grains include marketable grain, reserves for on-farm feed, seed use and dockage.

Commercial stocks (or in commercial positions): stocks of grain held at facilities such as elevators, terminals, mills, etc. Commercial stocks exclude dockage.

Dockage: dockage is material that must be removed from grain in order that the grain can be assigned the highest grade for which it qualifies.

Crop categories

Major field crops: wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

Oilseeds: canola, flaxseed, soybeans and sunflower seed.

Major special crops: dry peas, lentils, mustard seed, sunflower seed, Canary seed and chick peas.

Methodology and data quality

Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the July Farm Survey is selected.

The target population for the July Farm Survey includes all farms in Canada enumerated in the Census of Agriculture except institutional farms, farms on Indian reserves and farms from the Northwest Territories, Yukon, Nunavut and Atlantic region.

Probability surveys can use two types of sampling frames: list and area. In the July Farm Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 15,200 farms has been drawn from the list frame for the July 2011 Farm Survey.

Data collection

The July 2011 Farm Survey was carried out from July 25 to August 2. Data collection for Farm Surveys is undertaken using the "Computer assisted telephone interview" (CATI) system.

Edit and imputation

With the CATI system, it is possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

Response rate

Usually, by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 8 to 9%. The remainder of the sample unaccounted for can be explained by non-contact and non-response. Initial sample weights are adjusted by a process called "raising factor adjustment" in cases of total and partial non-response. No imputation is performed for missing values.

Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not from the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis, before final estimates are published.

Estimates of farm stocks of grains are obtained from the July Farm Survey but a major tool used in the verification of these estimates is the farm supply-disposition (or supply-demand) balance sheet. This table reflects activity on farm only before grain enters the commercial system. The supply and disposition numbers must be equal.

The supply is composed of opening farm stocks and production. The disposition is comprised of deliveries, seed use, closing farm stocks as well as feed, waste and dockage. The production is estimated from Farm Surveys conducted by Statistics Canada. Seed use data are based on average seeding rates.

A major portion of the deliveries are licensed grain deliveries obtained from the Canadian Grain Commission (CGC). Statistics Canada (StatCan) adjusts these deliveries during the estimation process to account for CGC quality problems and data lags. The adjustments are calculated mainly from commercial supply-demand tables using data available in the CGC publication *Grain Statistics Weekly*. However, the deliveries published in the StatCan farm supply-disposition tables reflect the CGC published data plus StatCan estimates for unlicensed deliveries to both domestic and export markets and to condominium storage.

The feed, waste and dockage (fwd) component is a residual in the balance sheet. Indicators such as the number of grain consuming animal units, harvest conditions affecting grain quality, established ratios of dockage to delivered grain and grain inspections are used to ensure data accuracy. An unusual estimate in this component may indicate a problem with another data series such as deliveries or may show a change in feeding patterns. Farm stocks are estimated from survey indicators in conjunction with the other components of the balance sheet. Therefore, any apparent fwd anomalies are unlikely to reflect problems with the level of the farm stocks.

National supply and disposition tables provide further information to aid in estimating farm stocks. More detailed information on supply & disposition tables may be obtained in the October issue of Statistics Canada, catalogue 22-007-X, *Cereals and Oilseeds Review*.

Revisions

Stocks data are subject to revision for two years after first being published. Any revisions are published in the July 31 stocks report.

The following table contains some statistics which indicate the magnitude and direction of past revisions to the July 31 farm stocks estimates. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of revisions is indicated by counting the number of years that the preliminary estimate is above or below the final revised estimate. The data indicate, for example, that the preliminary estimates of wheat farm stocks are revised by a magnitude of, on average, 3.2% and usually in a downwards direction.

Text table 1

Magnitude and direction of revisions to July 31 farm stocks, Canada, 2001 to 2010

| Crop | Average percent change | Number of years July 31 farm stocks are revised: | |
|----------------|------------------------|--|-----------|
| | | Upwards | Downwards |
| | % | Number | |
| Wheat | 3.2 | 2 | 4 |
| Oats | 0.8 | 0 | 2 |
| Barley | 1.1 | 3 | 0 |
| Flaxseed | 2.2 | 1 | 3 |
| Canola | 3.9 | 3 | 1 |
| Corn for grain | 1.1 | 1 | 1 |
| Soybeans | 8.8 | 4 | 2 |

Data quality

The July 31 farm stocks estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the “coefficient of variation” (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what would have been obtained from an enumeration of all farming operations would be less than twice the c.v.. This range of values is referred to as the “confidence interval”. While published estimates may not exactly equal the level indicators due to the validation process, these estimates do remain within the confidence interval of the survey level indicators. For the July Farm Survey, coefficient of variation range from 5% to 10% for the major crops. Coefficients of variation for specialty crops and small areas of major crops are usually within 10% and 25%.

Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

Field crop reporting series calendar

Catalogue 22-002-X

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 a.m., Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: agriculture@statcan.gc.ca.

| Report No. and Title | 2011 Release Dates |
|--|--------------------|
| 1 Stocks of principal field crops at December 31, 2010 | February 4 |
| 2 March intentions of principal field crop areas | April 26 |
| 3 Stocks of principal field crops at March 31, 2011 | May 6 |
| 4 Preliminary estimates of principal field crop areas | June 23 |
| 5 July 31 estimates of production of principal field crops | August 24 |
| 6 Stocks of principal field crops at July 31, 2011 | September 7 |
| 7 September estimates of production of principal field crops | October 4 |
| 8 November estimates of production of principal field crops | December 6 |

Cereals and oilseeds review

Catalogue 22-007-X

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.
