Highlights

Births and fertility are still continuing an upward trend but at a slowing pace compared to the two previous years

- For a sixth consecutive year, the number of live births in Canada increased, reaching 377,886 in 2008. However, this annual increase of 2.7% was less pronounced than the growth registered in the previous two years, namely 3.6% in 2006 and 3.7% in 2007.
- Since 2003, the TFR has seen an upward trend where the total fertility rate went from 1.53 to 1.68 in 2008. However, the increase between 2007 and 2008 was smaller (1.3%) than the two previous years where it was 2.8% between 2005 and 2006 and 4.6% between 2006 and 2007
- Nunavut, the Northwest Territories and Saskatchewan had the highest fertility in the country with more than two children per woman on average. In contrast, British Columbia had the lowest fertility of the country.
- The recent increase in births could be explained partly by a rise in fertility rates and by the fact that many women have entered their childbearing years.

Fertility was highest for women in their early thirties

• For a fourth consecutive year, the age-specific fertility rate for women aged 30 to 34 was the highest. In 2008, it was 107.4 births per 1,000 women.

Fertility continues to increase for women in their early forties

• The age-specific fertility rate of women aged 40 to 44 has more than doubled from 1988 to 2008, going from 3.6 to 8.4 per 1,000 women.

Births are up in all of Canada except the Northwest Territories

- From 2007 to 2008, the number of births rose in all provinces and territories except the Northwest Territories.
- The largest increases in number of births were in Newfoundland and Labrador (7.6%), Prince Edward Island (6.8%) and Yukon (5.1%).
- For Newfoundland and Labrador this is the fourth consecutive year of birth growth and the largest increase since 2005.

Stillbirths and stillbirth rate trends

- The number of stillbirths (or fetal deaths) in Canada was 2,774 in 2008, an increase of 5.2 % from 2007.
- From 2007 to 2008, the stillbirth rate went up from 7.1 per 1,000 total births (live births and stillbirths) to 7.3.

Introduction

This product presents statistical tables showing the number of live births and fetal deaths (stillbirths) of at least 20 weeks' gestation; total and age-specific fertility rates and crude birth rates; live births by age of mother and live birth order; male and female birth weights; weeks of gestation at the time of birth; and multiple births. Numbers are shown for Canada, the ten provinces and the three territories.

History note

Births - Shelf tables (84F0210X) data for 2000 and 2001 were released in the year 2003 in paper format. Since April 2004, this product is available on the Internet under the title "Births" (84F0210X).

The "Births, 2004" publication had two volumes. Volume 1 reported on live births and Volume 2 reported on fetal deaths (stillbirths).

Analysis

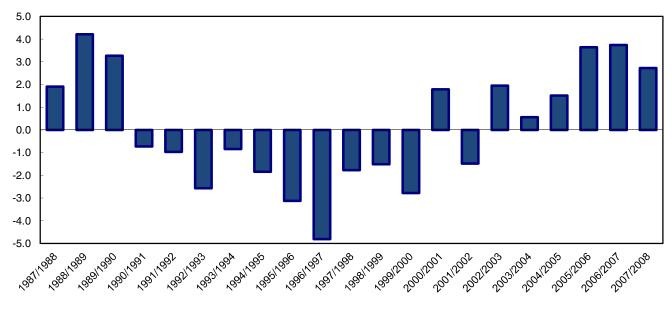

A. Change in births

For a sixth consecutive year, the number of live births in Canada increased, reaching 377,886 in 2008. However, this annual increase of 2.7% was less pronounced than the growth registered in the previous two years, namely 3.6% in 2006 and 3.7% in 2007 (Chart 1).

Chart 1

Percentage change in numbers of births, Canada, 1987/1988 to 2007/2008

percentage variation

Source(s): Statistics Canada, CANSIM table 102-4502 and Vital Statistics Compendium, 1996, catalogue no. 84-214-XPE.

Over the past 20 years, Canada has seen both upward and downward trends in the number of births. After peaking in 1990 at 405,486 births, the number of births fell steadily throughout the 1990s. In 2000, there were 327,882 registered births, the lowest level since the end of the Second World War. With the exception of 2002, there has been an upward trend in the number of births since 2001, with a slowing in 2008 when compared to the two previous years.

A.1. Geographic differences

From 2007 to 2008, the number of births rose in all provinces and territories except the Northwest Territories (Table 1). Eight provinces and one territory had relative increases exceeding the national average of 2.7%. The largest were in Newfoundland and Labrador (7.6%), Prince Edward Island (6.8%) and Yukon (5.1%). In Newfoundland and Labrador this is the fourth consecutive year of growth and the largest increase since 2005. On the other hand, a first sign of slowing in the increase of births was observed in 2008, mainly in Ontario and the Western provinces.

In 2008, three provinces accounted for 76% of the total increase in the number of births. Quebec was the largest contributor with 35% of the total increase, followed by Ontario (23%) and Alberta (18%). In 2007 Alberta led with 29%, followed by Ontario (21%), Quebec (18%), and British Columbia (14%).

B. Change in fertility

The total fertility rate (TFR) is the sum of single-year, age-specific fertility rates during a given year. It represents the average number of children that a woman would have if the current age-specific fertility rates prevail over her reproductive period.

In 2008, the TFR was 1.68 children per woman (Table 2). This is the highest TFR recorded since 1992, when it was 1.69. However, the TFR is well below the generational replacement level of 2.1 children per woman—the fertility rate that must be maintained to replace the population in the absence of migration. The last year that the total fertility rate exceeded the generational replacement level was 1971.¹

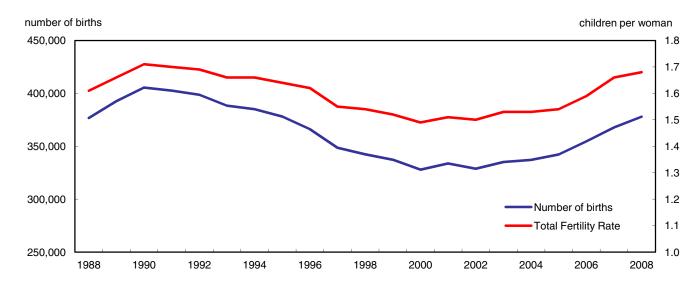

In the past twenty years, the TFR has closely paralleled the trend in number of births (Chart 2). After peaking in 1990 at 1.71 children per woman, the TFR fell throughout the 1990s and then began climbing at the beginning of the 2000s. The drop in the TFR (and the number of births) in 2000 and the recovery in 2001 may have been related to the desire to have a baby in the first year of the new millennium. The number of marriages also increased in 2000.²

Chart 2

Births and total fertility rates, Canada, 1988 to 2008

Note(s): Total fertility rate is the average number of children per woman.

Source(s): Statistics Canada, CANSIM table 102-4502 and 102-4505 and Vital Statistics Compendium, 1996, catalogue no. 84-214-XPE.

With the exception of 2002, the TFR has seen an upward trend since 2001 (Table 2). The TFR rose 1.3% from 2007 to 2008, a smaller increase than those observed the two previous years, where the increases were 2.8 % and 4.6 %, respectively.

Text table 2

Total fertility rate by geography, Canada, 2007 and 2008

Geography	2007	2008	Difference in percentage
Canada	1.66	1.68	1.3
Newfoundland and Labrador	1.46	1.58	8.4
Prince Edward Island	1.63	1.73	5.8
Nova Scotia	1.48	1.54	4.0
New Brunswick	1.52	1.59	4.2
Quebec	1.69	1.74	3.1
Ontario	1.57	1.58	0.7
Manitoba	1.96	1.96	-0.2
Saskatchewan	2.03	2.05	1.0
Alberta	1.90	1.92	0.7
British Columbia	1.52	1.51	-0.6
Yukon	1.58	1.64	3.7
Northwest Territories	2.11	2.08	-1.4
Nunavut	2.97	2.98	0.3

Note(s): Total fertility rate is the average number of children per woman. **Source(s):** Statistics Canada, CANSIM table 102-4505.

In 2008, Nunavut had the highest fertility in the country, with a TFR of 2.98 children per woman, ensuring the generational replacement level. In contrast, British Columbia had the lowest TFR with 1.51 children per woman (Table 2).

Other provinces and territories with a TFR lower than the national average of 1.68 children per woman were Nova Scotia, Newfoundland and Labrador, Ontario, New Brunswick and Yukon. On the other hand, the Northwest Territories and Saskatchewan were the two other regions where fertility was higher than two children per

woman, 2.08 and 2.05 respectively. This may be explained by the fact that Aboriginal people made up the largest share of the population in the territories and in the Prairie provinces³ and it is known that Aboriginal population is a relatively young population with a higher fertility than the non-Aboriginal population.

From 2007 to 2008, the TFR rose in all provinces and territories except the Northwest Territories, British Columbia and Manitoba. The largest increase was observed in Newfoundland and Labrador, with 0.12 children per woman more than in 2007. Five other regions (Prince Edward Island, Nova Scotia, New Brunswick, Quebec and Yukon) had a larger percentage change than the national average. On the other hand, increases below the national average were registered in Ontario, Saskatchewan, Alberta and Nunavut.

B.1. Age of mother and age-specific fertility rate

The average age of Canadian women who gave birth in 1991 was 27.7 years. In subsequent years it increased to reach 29.3 years in 2006 where it has since remained stable. The lowest average age of women who gave birth in 2008 was observed in Nunavut (24.4 years) while the highest was in Ontario and British Columbia (30.0 years).

From 1988 to 2008, there have been significant changes in the trend of age-specific fertility rates in Canada. The past twenty years saw an overall decline in the total fertility rate of Canadian women in their twenties, while that of women in their thirties increased steadily. In 2006, the fertility rate of women aged 30 to 34 surpassed the fertility rate of those aged 25 to 29 (Chart 3).

From 2006 to 2008, all age-specific fertility rates of Canadian women increased. For a fourth consecutive year, the fertility rate was highest for women aged 30 to 34 (107.4 births per 1,000 women in 2008). This rate was also the highest since 1965 (119 births per 1,000 women). In addition, since 2006, the increase in the fertility rate of women aged 30 to 34 was larger than for those aged 25 to 29, widening the gap between these two age groups.

Although the fertility of females aged 15 to 19 has risen slightly in recent years, the level in 2008 (14.3 births per 1,000 women) was 1.6 times lower than in 1988 (23.0 births per 1,000 women).

The fertility of women aged 40 to 44 has more than doubled from 1988 to 2008, going from 3.6 to 8.4 per 1,000 women. A recent study found that the length of schooling is an important factor in explaining that increase.⁴ The study also indicates that immigrant women, who are more likely to have a university degree, are also more likely to have a young child when they are in their forties. The demographic share of these women is increasing due to steady immigration levels since the beginning of the 1990's⁵.

Age-specific fertility rates, Canada, 1988 to 2008

Source(s): Statistics Canada, CANSIM table 102-4505 and Births, Catalogue no. 84F0210X.

In 2008, among the 10 provinces and females aged 29 years and under, Saskatchewan had the highest fertility rates. For women aged 30 to 34, the fertility rate was highest in Alberta. Ontario had the highest rate for women aged 35 to 39 and British Columbia for women aged 40 years and over.

B.2. Analysing 2008 fertility rates

Two factors could account for the increase in the number of births in recent years: an increase in the number of women of childbearing age and a rise in fertility rates.

By applying age-specific fertility rates (ASFRs) for 2007 to the female population in 2008, it is possible to estimate how much of the increase in births in 2008 can be attributed to changes in the size of the population compared with changes in fertility rates (Table 3).

If there had been no change in age-specific fertility rates from 2007 to 2008, the expected number of births in 2008 would have been 372,620, or 4,756 more births than in 2007. In fact, from 2007 to 2008, there was an increase of 10,022 births. The additional 5,266 births can therefore be attributed to changes in fertility. Also, the greatest change in fertility rate between 2007 and 2008 is found in women aged 30 to 39.

Age Group	2007 ASFR ¹	2008 female population (PR)	Expected births ²	2008 ASFR ¹	Difference 2007-2008 ASFR ³	2007 female population (PR)	Difference 2007-2008 female population

C. Historical and recent birth trends

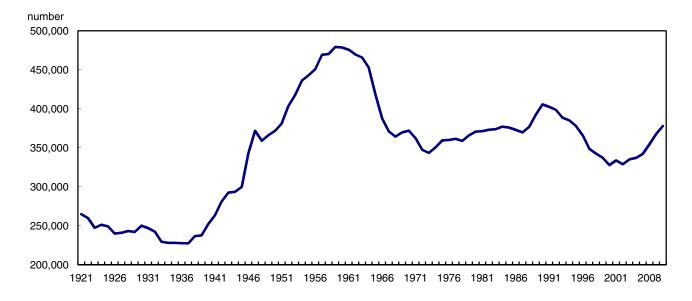

The period from the end of the Second World War to the mid-1960s witnessed a dramatic increase in the fertility rates, the result of which was the baby boom phenomenon.

In 1947, when the TFR was 3.6 children per woman—the highest rate since 1921⁶—the number of births totalled 372,600 and the crude birth rate was 28.9 births per 1,000 population.

At the height of the baby boom in 1959, when the TFR was 3.9 children per woman, annual births exceeded 479,000, the highest number recorded since comparable Canada-wide vital statistics were first compiled in 1921 (Chart 4).

Chart 4 Births, Canada, 1921 to 2008

Source(s): Statistics Canada, CANSIM table 102-4502, Births, Catalogue no. 84F0210X and Selected Historical Statistics, Canada, 1921-1990, Catalogue no. 82-553-X Occasional.

The annual number of births remained high for a few more years, and then dropped sharply starting in 1964. This period of low numbers of births, known as the baby bust,⁷ lasted for approximately 10 years until the mid-1970s, reaching its lowest level in 1973.

The first baby boom "echo"⁸ was expected in the mid-1970s, approximately 25 years after the beginning of the baby boom. But while there was a sizable increase in the number of births in 1974 and 1975, gains in the following years were relatively modest. Only in the late 1980s (1988 to 1990) was there a substantial rise in the number of births.

From 1988 to 1995, Canada experienced a large number of births. Specifically, births peaked at 405,486 in 1990. Thereafter, annual births dropped, falling to 327,882 in 2000, which was less than the lowest number in the baby bust period.

Between 2002 and 2008, Canada has seen a continuous upward trend in the number of births. Part of the recent increase in births could be explained by the fact that many women from the baby boomer's children's generation have now entered their childbearing years, as well as by the increase in fertility rates. Total fertility rate increased from 1.50 children per woman in 2002 to 1.68 in 2008.

D. Comparison with selected low-fertility countries

A low-fertility country is one in which the total fertility rate (TFR) is below or near the generational replacement level (2.1 children per woman). Low fertility is a phenomenon that Canada shares with many countries. Moreover, the recent rise in the number of births in Canada parallels trends in several other low-fertility OECD countries, which have also experienced an upturn in fertility in recent years (Table 4).

From 2004 to 2008, the TFR increased in the 15 selected OECD countries (see Table 4). In Canada, the increase in fertility was modest until 2006, whereas in 2007, there was a surge which subsequently slowed.

^{8.} Demency, P. and G. McNicoll, editors. 2003. Encyclopedia of Population. Vol. 1, New York, U.S.A. MacMillan Reference USA, p. 73.

Between 2006 and 2007, two other countries, the Czech Republic and Australia, had a stronger increase in fertility than Canada and a slight slowdown between 2007 and 2008.

From 2007 to 2008, all the selected OECD countries saw their fertility rise, except the United States, for which the total fertility rate went from 2.12 to 2.08 children per woman.

E. Change in stillbirths

The number of stillbirths (or fetal deaths) in Canada was 2,774 in 2008, an increase of 137 stillbirths (5.2%) from 2007.

The stillbirth rate also went up slightly from 7.1 per 1,000 total births (live births and stillbirths) in 2007 to 7.3 in 2008. From 1991 to 2006, stillbirth rates fluctuated at around 6.0 per 1,000 total births. However, the late stillbirth rate (fetal deaths at 28 or more weeks of gestation) peaked at 3.8 per 1,000 total births in 1992 and then decreased to 3.1 in 2008.

1. Partway through 2003, Alberta Registries amended their Registration of Birth form in such a way that Statistics Canada can no longer determine the legal marital status of those persons in common-law marriages. **Note(s):** See "Data quality, concepts and methodology — Explanatory notes for the tables". **Source(s):** Statistics Canada, Canadian Vital Statistics, Birth Database (CANSIM table 102-4506).

Table 3 Mean age of mother¹, by geography

Place of residence of mother	Mean age of mother				
	years				
Canada	29.3				
Newfoundland and Labrador Prince Edward Island Nova Scotia New Brunswick Quebec Ontario Manitoba Saskatchewan Alberta British Columbia Yukon Northwest Territories Nunavut	28.3 28.5 28.6 27.9 29.3 30.0 27.8 27.1 28.8 30.0 29.0 27.9 24.4				

Mean age of mother for Canada, a province or a territory is calculated by summing the mothers' ages at their last birthday preceding delivery and then dividing the sum by the total number of live births in that jurisdiction. To estimate mid-year mean age, a statistic often used in analyses, add 0.5 to the mean age in this table.
 Note(s): See "Data quality, concepts and methodology — Explanatory notes for the tables".
 Source(s): Statistics Canada, Canadian Vital Statistics, Birth Database (CANSIM table 102-4504).

1. Age of mother attained at the last birthday preceding delivery.

2. Age-specific fertility rate (ASFR) is the number of live births per 1,000 females in a specific age group. Five-year age groups were used in these tabulations (ranging from 15 to 19 years to 45 to 49 years).

3. Live births to females under 20 years of age per 1,000 females aged 15 to 19.

4. Total fertility rate is an estimate of the average number of live births a female can be expected to have in her lifetime, based on the age-specific fertility rates (ASFR) of a given year. The total fertility rate (TFR) = SUM of single year of age-specific fertility rates.

Note(s): See "Data quality, concepts and methodology - Explanatory notes for the tables".

Unknown	0	0	0	0	0	0

1. Mean birth weight is calculated for Canada, a province or a territory by summing the first weight of each newborn (obtained immediately after birth) and then dividing the sum by the total number of live births in that jurisdiction.

2. Median birth weight refers to the middle value birth weight when newborns' birth weight is ranked from lightest to heaviest. In the case of an even number of observations, the median is the arithmetic average of the two middle values.

Note(s): See "Data quality, concepts and methodology - Explanatory notes for the tables".

1. Number of live births includes births with unknown birth weight.

2. Age of mother attained at the last birthday preceding delivery.

For confidentiality reasons, live births to mothers aged 50 and over are included in the category "Age of mother, not stated." Where information is unavailable on 3. the birth mother of children who are adopted, these records are included in the category "Age of mother, not stated."

4. Partway through 2003, Alberta Registries amended their Registration of Birth form in such a way that Statistics Canada can no longer determine the legal marital status of those persons in common-law marriages.

1. Weeks of gestation, 20 weeks or more (fetal deaths) refers to a fetal death (stillbirth) with a duration of pregnancy of 20 weeks or more, or a birth weight of 500 grams or more. Fetal deaths with unknown weeks of gestation are included.

2. Weeks of gestation, 28 weeks or more (late fetal deaths) refers to a fetal death (stillbirth) with a duration of pregnancy of 28 weeks or more. Fetal deaths with unknown weeks of gestation are excluded.

Definitions

The definitions used for the production of statistical tables of Canadian vital statistics data are based on those recommended by the World Health Organization¹ and the United Nations.²

Age of mother. Age the mother attained at her last birthday preceding delivery.

Birth. The complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy. See also "Fetal death (stillbirth)" and "Live birth".

Birth and fertility rates

- Age-specific fertility rate (ASFR): The number of live births per 1,000 women in a specific age group. Five-year age groups were used in these tabulations (ranging from 15 to 19 to 45 to 49 years).
- Age-specific fertility rate, women 15 to 19 years: Live births to women under age 20 per 1,000 women aged 15 to 19.
- Crude birth rate: The number of live births per 1,000 population.
- Total fertility rate (TFR): An estimate of the average number of live births a woman can be expected to have in her lifetime, based on the age-specific fertility rates (ASFR) of a given year. The total fertility rate (TFR) = SUM of single year of age-specific fertility rate.

Birth weight. The first weight of the fetus or newborn obtained immediately after birth, expressed in grams.

- Extremely low birth weight: Birth weight under 1,000 grams.
- Very low birth weight: Birth weight under 1,500 grams.
- Low birth weight: Birth weight under 2,500 grams.
- Normal birth weight: Ranges from 2,500 to 4,499 grams.
- High birth weight: Birth weight of 4,500 or more grams.

Delivery. A delivery may consist of one or more live born or stillborn fetuses. The number of deliveries in a given period will be equal to or less than the number of births because multiple births (twins, triplets or higher-order births) are counted as single deliveries.

Fetal death (stillbirth). See Stillbirth definition.

Fetal death (stillbirth) rate. See Stillbirth rate definition.

Live birth. The complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

^{1.} World Health Organization (WHO). International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Volumes 1 and 2 (ICD–10). Geneva, 1992.

^{2.} United Nations. Principles and Recommendations for a Vital Statistics System. Statistical Papers, Series M, No. 19, Rev. 1. New York, 1974.

Marital status of mother. Refers to the legal conjugal status of the mother at the time of the delivery. Persons in common-law relationships are assigned to their legal marital status category. A **single** person is one who has never been married, or a person whose marriage has been annulled and who has not remarried. A **separated** person is legally married but is not living with his or her spouse because the couple no longer wants to live together. A **divorced** person is one who has obtained a legal divorce and has not remarried. A **married** person is one who is legally married and not separated. A person whose spouse has died and who has not remarried is **widowed**.

Mean age of mother. The mean (average) age of mother for Canada, a province or a territory is calculated by summing the mothers' ages at their last birthday preceding delivery, and then dividing the sum by the total number of live births in that jurisdiction. To estimate mid-year mean age, a statistic often used in analyses, add 0.5 to mean age.

Mean birth weight. The mean (average) birth weight for Canada, a province or a territory is calculated by summing the first weight of each live newborn (obtained immediately after birth), and then dividing the sum by the total number of live births in that jurisdiction.

Median birth weight. The median is the middle value in a set of ordered numbers (for example, newborns' birth weight ranked from lightest to heaviest). In the case of an even number of observations, the median is the average of the two middle values.

Multiple birth. A delivery that results in more than one birth, whether live born or stillborn. This includes the delivery of twins, triplets, quadruplets, quintuplets and more.

Parity of mother. The number of live births a woman has had to date (excludes fetal deaths or stillbirths). A woman with zero parity has had no live births; a woman of parity 1 has had one live birth, of parity 2, two live births, and so on. In the case of a first delivery resulting in live twins, the woman has a parity of 1 after the first twin is born and a parity of 2 after the second twin is born.

Population. Persons whose usual place of residence is somewhere in Canada, including Canadian government employees stationed abroad and their families, members of the Canadian Armed Forces stationed abroad and their families, crews of Canadian merchant vessels, and non-permanent residents of Canada.

Mid-year (July 1) population estimates are used to calculate the rates in vital statistics publications (see Appendix I).

Provinces and territories. Unless otherwise stated, the geographic distribution of births and fetal deaths (stillbirths) in the tables of this publication is based on the mother's usual place of residence.

Nunavut came into being officially as a Territory of Canada on April 1, 1999. The name Northwest Territories applies to a Territory with different geographic boundaries before and after April 1, 1999.

Stillbirth (fetal death). Death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Only fetal deaths where the product of conception has a birth weight of 500 grams or more or the duration of pregnancy is 20 weeks or longer are registered in Canada.

In Quebec (as well as in Saskatchewan prior to 2001 and in New Brunswick prior to November 1996), only fetal deaths (stillbirths) weighing 500 or more grams must be reported, regardless of the gestation period.

Because of these differences in reporting requirements, fetal death (stillbirth) data are presented for two gestation periods: 20 or more weeks of gestation (including fetal deaths or stillbirths with unknown weeks of gestation), and 28 or more weeks of gestation (excluding unknown weeks of gestation).

Stillbirth (fetal death) rate. The number of fetal deaths (stillbirths) per 1,000 live births plus fetal deaths (stillbirths).

Type of birth. Type of birth refers to the plurality of a delivery, that is, whether the delivery results in the birth of one or more live born or stillborn infants.

Weeks of gestation. The interval, in completed weeks, between the first day of the mother's last menstrual period and the day of delivery (that is, the duration of pregnancy). It can also be any estimate of that interval, based on ultrasound, a physical examination or other method. Canadian birth registration documents do not specify how the gestational age was calculated. **Pre-term** refers to a period of gestation less than 37 completed weeks; **term**, 37 through 41 completed weeks; and **post-term**, 42 or more completed weeks.

Table 1 Live births, by sex and geography

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births to mothers who are residents of Canada, with unknown province or territory of residence.

Table 2 Live births, by geography

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births to mothers who are residents of Canada, with unknown province or territory of residence.
- Marital status of mother refers to her legal conjugal status at the time of the birth. Persons in common-law
 relationships are assigned to their legal marital status category. A single person is one who has never been
 married, or a person whose marriage has been annulled and who has not remarried. A separated person is
 legally married but is not living with his or her spouse because the couple no longer wants to live together. A
 divorced person is one who has obtained a legal divorce and has not remarried. A married person is one who is
 legally married and not separated. A person whose spouse has died and who has not remarried is widowed.

Table 3 Mean age of mother, by geography

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births to mothers who are residents of Canada, with unknown province or territory of residence.

Table 4 Crude birth rate, age specific and total fertility rates, by geography

• Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Rates for Canada include live births to mothers who are residents of Canada, with unknown province or territory of residence.

Table 5 Mean and median birth weight, by geography

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births to mothers who are residents of Canada, with unknown province or territory of residence.
- Birth weight is the first weight of the newborn obtained immediately after birth, expressed in grams.

Table 6 Live births, Canada

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- Marital status of mother refers to her legal conjugal status at the time of the birth. Persons in common-law
 relationships are assigned to their legal marital status category. A single person is one who has never been
 married, or a person whose marriage has been annulled and who has not remarried. A separated person is
 legally married but is not living with his or her spouse because the couple no longer wants to live together. A
 divorced person is one who has obtained a legal divorce and has not remarried. A married person is one who is
 legally married and not separated. A person whose spouse has died and who has not remarried is widowed.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Parity refers to the number of live births a female has had to date (excludes fetal deaths or stillbirths). A female
 with zero parity has had no live births; a female of parity 1 has had one live birth, of parity 2, two live births and
 so on. In the case of a first delivery resulting in live twins, the female has a parity of 1 after the first twin is born
 and a parity of 2 after the second twin is born.

Table 7 Live births, by birth weight and geography

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- Birth weight is the first weight of the newborn obtained immediately after birth, expressed in grams.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births to mothers who are residents of Canada, with unknown province or territory of residence.

Table 8 Live births, by weeks of gestation and geography

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- Weeks of gestation refers to the interval, in completed weeks, between the first day of the mother's last menstrual
 period and the day of delivery (that is, the duration of the pregnancy). It can also be any estimate of that interval,
 based on ultrasound, a physical examination or other method. Canadian birth registration documents do not
 specify how the weeks of gestation are to be calculated.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births to mothers who are residents of Canada, with unknown province or territory of residence.

Table 9 Live births, by characteristics of the mother and child, Canada

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- The geographic distribution of live births in this table is based on the mother's usual place of residence.
- Birth weight is the first weight of the newborn obtained immediately after birth, expressed in grams.
- Parity refers to the number of live births a female has had to date (excludes fetal deaths or stillbirths). A female with zero parity has had no live births; a female of parity 1 has had one live birth, of parity 2, two live births and so on. In the case of a first delivery resulting in live twins, the female has a parity of 1 after the first twin is born and a parity of 2 after the second twin is born.
- Marital status of mother refers to her legal conjugal status at the time of the birth. Persons in common-law
 relationships are assigned to their legal marital status category. A single person is one who has never been
 married, or a person whose marriage has been annulled and who has not remarried. A separated person is
 legally married but is not living with his or her spouse because the couple no longer wants to live together. A
 divorced person is one who has obtained a legal divorce and has not remarried. A married person is one who is
 legally married and not separated. A person whose spouse has died and who has not remarried is widowed.
- Type of birth refers to the plurality of a delivery, that is, whether the delivery results in the birth of one or more liveborn or stillborn infants. The delivery must result in the birth of at least one liveborn infant to be included in this table. The category "Type of birth, multiple" includes the delivery of twins, triplets, quadruplets, quintuplets or more.
- Weeks of gestation refers to the interval, in completed weeks, between the first day of the mother's last menstrual
 period and the day of delivery (that is, the duration of the pregnancy). It can also be any estimate of that interval,
 based on ultrasound, a physical examination or other method. Canadian birth registration documents do not
 specify how the weeks of gestation are to be calculated.

Table 10 Live births, by place of residence of mother and place of occurrence, Canada, provinces, territories and outside Canada

 Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

- Unknown province or territory of residence of mother, refers to live births to mothers who are residents of Canada, with unknown province or territory of residence.
- Place of residence of mother outside Canada includes live births to mothers who are non-residents of Canada
 and births with unknown country of residence of mother. Data by place of residence outside Canada have been
 revised for 2007.

Table 11 Fetal deaths (20 weeks or more of gestation) and late fetal deaths (28 weeks or more of gestation), Canada, provinces and territories

- Fetal death (stillbirth) is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Only fetal deaths where the product of conception has a birth weight of 500 grams or more or the duration of pregnancy is 20 weeks or longer are registered in Canada.
- Weeks of gestation refers to the interval, in completed weeks, between the first day of the mother's last menstrual
 period and the day of delivery (that is, the duration of the pregnancy). It can also be any estimate of that interval,
 based on ultrasound, a physical examination or other method. Canadian birth registration documents do not
 specify how the weeks of gestation are to be calculated.
- Fetal death (stillbirth) data are tabulated according to the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to fetal deaths (stillbirths) to mothers who are residents of Canada, with unknown province or territory of residence.

Table 12-1 Live births and fetal deaths (stillbirths), by geography – Type of birth (single or multiple)

- Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.
- Fetal death (stillbirth) is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Only fetal deaths where the product of conception has a birth weight of 500 grams or more or the duration of pregnancy is 20 weeks or longer are registered in Canada.
- Type of birth refers to the plurality of a delivery, that is, whether the delivery results in one or more liveborn or stillborn infants. The category "Type of birth, multiples" includes the delivery of twins, triplets, quadruplets, quintuplets or more.
- The geographic distribution of live births and fetal deaths (stillbirths) in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births or fetal deaths (stillbirths) to mothers who are residents of Canada, with unknown province or territory of residence.

Table 12-2 Live births and fetal deaths (stillbirths), by geography – Place of birth (hospital and non-hospital)

 Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

- Fetal death (stillbirth) is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Only fetal deaths where the product of conception has a birth weight of 500 grams or more or the duration of pregnancy is 20 weeks or longer are registered in Canada.
- The category "Place of birth, non-hospital" includes births in private homes, in health care institutions such as nursing homes and other long-term care facilities, nursing stations and other short-term care facilities and other health care facilities not licensed to operate as hospitals by provincial, territorial or federal governments, such as free-standing birthing centres and at other specified sites.
- The geographic distribution of live births and fetal deaths (stillbirths) in this table is based on the mother's usual place of residence.
- Unknown province or territory of residence of mother, refers to live births or fetal deaths (stillbirths) to mothers who are residents of Canada, with unknown province or territory of residence.

These postcensal population estimates, which are based on the 2006 census, are adjusted for net census undercoverage and include non-permanent residents.
 2008 population counts for the "under 1" and "1 to 4" categories were adjusted for 2008 births by Health Statistics Division.
 Sources: Statistics Canada, Demography Division (CANSIM table 051-0001 released on September 29, 2010) and Health Statistics Division.
