

HOUSING NOW

Thunder Bay CMA

CANADA MORTGAGE AND HOUSING CORPORATION

Date Released: Fourth Quarter 2012

New Home Market

Single-detached homes leading the market

Third quarter single-detached housing starts activity continued the brisk pace set in the second quarter. Last quarter's 82 single-detached starts were 9.3 per cent better than last year's third quarter and 16 per cent higher than the five-year average for the same period. The new home market continues to benefit from very

low mortgage rates, strong migration and robust job growth. A very tight resale market has also translated into rising new home demand and more housing starts.

Semi, row and apartment starts are trailing last year's activity with only 33 starts so far this year. Last year's activity was bolstered by one large 132 unit project that inflated total starts for the year. Nonetheless, a declining vacancy rate and continued opportunities in the empty nester

and seniors market are generating interest amongst developers in concepts targeting these market niches. According to CMHC's April Rental Market Survey, the vacancy rate posted a decline in Thunder Bay compared to April 2011. The vacancy rate for privately initiated structures with at least three units is 1.8 per cent, down from 2.1 per cent in 2011.

Elsewhere in Northwestern Ontario, Kenora is still well ahead of last year's numbers for housing starts with 35 units counted for the first nine months of 2012 against nine for the same period in 2011. Kenora's economy has been fairly resilient in spite of the forest products sector having been decimated causing the closure of some of Kenora's key manufacturing operations.

Table 4 presents analysis of supply and demand in Thunder Bay. Absorption volumes indicate that the bulk of the activity continues to be in the \$250,000 to \$300,000 price range. Third quarter activity mirrored what has been occurring for the year as a whole compared to the third quarter of 2011. Forty-six per cent of the 2012 Q3 absorptions were in the \$250,000 to \$300,000.

Despite the relatively high price of new construction in Thunder Bay, the New Home Price index has not shown significant movement since 2007 and 2008. In the years following, the index has been essentially flat although of late, it is starting to pick up with prices 1.3 per cent ahead of last year to September 30th. Provincially and nationally, growth in the price index averaged 2.8 per cent in 2011 and 3.4 per cent thus far in

2012. As demand picks up in the US housing market, the index may rise more rapidly.

After a strong first quarter, employment growth has levelled off in Thunder Bay. Despite the stabilization, employment is still up from last year. The Goods-Producing sector of the local economy is carrying the growth that is being witnessed in Thunder Bay with both mining and manufacturing employment leading this growth. Mining services, especially on the engineering and technical side, are ramping up thanks to nine mining projects moving further along the development path. Mining readiness is the focus of the City at present and the community attempts to reap the most benefits from the growth underway in this vibrant sector.

Resale Market

Third quarter sales flat

With merely 391 sales counted, the second lowest third quarter in the last ten years, Thunder Bay existing Multiple Listing Service® home sales

are off 1.4 per cent on a year-over-year basis. Active listings remain low despite having seen new listings grow in the third quarter more than eight per cent year-over-year. The sales to new listings ratio was 72 per cent in the third quarter, clearly in seller's territory. The tight supply-demand relationship has driven up prices over 11 per cent to September 30th quarter-over-quarter.

The rapid price gains in 2012 calls for further analysis of sales by dwelling type. Thunder Bay's signature unit, the bungalow, is pervasive in the market representing approximately forty-five per cent of total MLS sales. Other dwelling types studied included two-storey units, bi-level units and storey-and-a-half units. Each of these three dwelling types represents ten to eighteen per cent of the market. Analysis of the four dwelling types served to discount any theories that higher top-of-market sales are unduly skewing the market average upwards. On the contrary, analysis shows that all segments of the market have been showing strong average price gains.

Figure 2

Additional supporting evidence of the hot Thunder Bay market is the number of units selling at or over list price. Thus far in 2012, forty-eight per cent of all MLS sales have sold at or over list price, up from 36 per cent and 28 per cent during the same period in 2011 and 2010 respectively.

Bidding wars are the norm for highly-sought-after units and frustration is a common sentiment that those seeking to buy are experiencing.

Despite above average price increases, average mortgage carrying costs are still the second lowest in the province

for centres over 100,000 behind Windsor. With carrying costs ramping up, this label of being affordable may change to markets across the country.

Thunder Bay Employment and Income Providing Stability

Estimation of migration numbers for 2010-2011 indicate that the net natural increase is negative with deaths outstripping births in recent years, so positive in-migration is key in keeping the population stable. In order to achieve this Thunder Bay must post growth in regards to employment and income. Income and employment growth have helped stimulate housing demand for all types and tenures of housing in Thunder Bay.

After falling 1.3 per cent last year, jobs increased strongly through the third quarter by 5.0 per cent compared to the same period in 2011 average. Thunder Bay completed the quarter averaging 61,000 employed. With employment rising year-over-year and the unemployment rate expected to fall below 6 per cent, one other important variable is income.

Average weekly earnings, a proxy for income, rose 3.6 per cent

year-over-year in the third quarter. This magnitude of growth surpassed the provincial average but is slightly behind the country for the third quarter. Migration has been positive of late and with employment growing, it is reasonable to expect further positive in-migration.

METHODOLOGY

Starts & Completions Survey Methodology

The Starts and Completions Survey is conducted by way of site visits which are used to confirm that new units have reached set stages in the construction process. Since most municipalities in the country issue building permits, these are used as an indication of where construction is likely to take place. In areas where there are no permits, reliance has to be placed either on local sources or searching procedures.

The Starts and Completions Survey is carried out monthly in urban areas with population in excess of 50,000, as defined by the 2006 Census. In urban areas with populations of 10,000 to 49,999, all Starts are enumerated in the last month of the quarter (i.e. four times a year, in March, June, September and December). In these centres with quarterly enumeration, Completion activity is modelled based on historical patterns. Monthly Starts and Completions activity in these quarterly locations are statistically estimated at a provincial level for single and multi categories. Centres with populations below 10,000 are enumerated on a sample basis, also in the last month of each quarter (i.e. four times a year, in March, June, September and December).

The Starts and Completions Survey enumerates dwelling units in new structures only, designed for non-transient and year-round occupancy.

Mobile homes are included in the surveys. A mobile home is a type of manufactured house that is completely assembled in a factory and then moved to a foundation before it is occupied.

Trailers or any other movable dwelling (the larger often referred to as a mobile home) with no permanent foundation are excluded from the survey.

Conversions and/or alterations within an existing structure are excluded from the surveys as are seasonal dwellings, such as: summer cottages, hunting and ski cabins, trailers and boat houses; and hostel accommodations, such as: hospitals, nursing homes, penal institutions, convents, monasteries, military and industrial camps, and collective types of accommodation such as: hotels, clubs, and lodging homes.

Market Absorption Survey Methodology

The Market Absorption Survey is carried out in conjunction with the Starts and Completions Survey in urban areas with populations in excess of 50,000. When a structure is recorded as completed, an update is also made as units are sold or rented. The dwellings are then enumerated each month until such time as full absorption occurs.

STARTS AND COMPLETIONS SURVEY AND MARKET ABSORPTION SURVEY DEFINITIONS

A “**dwelling unit**”, for purposes of the Starts and Completions Survey, is defined as a structurally separate set of self-contained living premises with a private entrance from outside the building or from a common hall, lobby, or stairway inside the building. Such an entrance must be one that can be used without passing through another separate dwelling unit.

A “**start**”, for purposes of the Starts and Completions Survey, is defined as the beginning of construction work on a building, usually when the concrete has been poured for the whole of the footing around the structure, or an equivalent stage where a basement will not be part of the structure.

The number of units “**under construction**” as at the end of the period shown, takes into account certain adjustments which are necessary for various reasons. For example, after a start on a dwelling has commenced construction may cease, or a structure, when completed, may contain more or fewer dwelling units than were reported at start.

A “**completion**”, for purposes of the Starts and Completions Survey, is defined as the stage at which all the proposed construction work on a dwelling unit has been performed, although under some circumstances a dwelling may be counted as completed where up to 10 per cent of the proposed work remains to be done.

The term “**absorbed**” means that a housing unit is no longer on the market (i.e. has been sold or rented). This usually happens when a binding contract is secured by a non-refundable deposit and has been signed by a qualified purchaser. The purpose of the Market Absorption Survey is to measure the rate at which units are sold or rented after they are completed, as well as collect prices.

DWELLING TYPES:

A **“Single-Detached”** dwelling (also referred to as **“Single”**) is a building containing only one dwelling unit, which is completely separated on all sides from any other dwelling or structure. Includes link homes, where two units may share a common basement wall but are separated above grade. Also includes cluster-single developments.

A **“Semi-Detached (Double)”** dwelling (also referred to as **“Semi”**) is one of two dwellings located side-by-side in a building, adjoining no other structure and separated by a common or party wall extending from ground to roof.

A **“Row (Townhouse)”** dwelling is a one family dwelling unit in a row of three or more attached dwellings separated by a common or party wall extending from ground to roof.

The term **“Apartment and other”** includes all dwellings other than those described above, including structures commonly known as stacked townhouses, duplexes, triplexes, double duplexes and row duplexes.

INTENDED MARKET:

The **“intended market”** is the tenure in which the unit is being marketed. This includes the following categories:

Freehold: A residence where the owner owns the dwelling and lot outright.

Condominium (including Strata-Titled): An individual dwelling which is privately owned, but where the building and/or the land are collectively owned by all dwelling unit owners. A condominium is a form of ownership rather than a type of house.

Rental: Dwelling constructed for rental purposes regardless of who finances the structure.

GEOGRAPHICAL TERMS:

A census metropolitan area (CMA) or a census agglomeration (CA) is formed by one or more adjacent municipalities centred on a large urban area (known as the urban core). The census population count of the urban core is at least 10,000 to form a census agglomeration and at least 100,000 to form a census metropolitan area. To be included in the CMA or CA, other adjacent municipalities must have a high degree of integration with the central urban area, as measured by commuting flows derived from census place of work data. CMAs and CAs contain whole municipalities or Census Subdivisions.

A **“Rural”** area, for the purposes of this publication, is a centre with a population less than 10,000.

All data presented in this publication is based on Statistics Canada’s 2006 Census area definitions.

CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for more than 65 years.

Together with other housing stakeholders, we help ensure that the Canadian housing system remains one of the best in the world. We are committed to helping Canadians access a wide choice of quality, environmentally sustainable and affordable housing solutions that will continue to create vibrant and healthy communities and cities across the country.
