- As of December 31, 2011, total stocks of most principal field crops, including commercial and on-farm inventories, were down compared with the same date a year earlier.

# Analysis

---

## Stocks of principal field crops at December 31, 2011

As of December 31, 2011, total stocks of most principal field crops, including commercial and on-farm inventories, were down compared with the same date a year earlier.

Despite record production of canola in 2011, up 10.9% from 2010, total stocks declined for the second consecutive year, down 1.5% to 9.3 million tonnes, as a 2.4% decline in on-farm stocks more than offset a slight increase in commercial stocks.

On-farm stocks of all types of wheat fell 4.0% to 16.3 million tonnes. However, commercial stocks increased 20.9% to 4.7 million tonnes. As a result, total stocks edged up 0.6% from December 31, 2010 to just under 21.0 million tonnes, despite a 9.0% increase in wheat production in 2011. The decline in on-farm stocks at the national level was the result of a drop in on-farm storage in Saskatchewan and significant declines in production and on-farm storage in Manitoba.

Total stocks of corn for grain fell 4.0% to 8.6 million tonnes in tandem with a decline in production. However, on-farm stocks rose 1.5% to 6.8 million tonnes, the result of a 4.9% increase in on-farm stocks in Ontario, where they reached a record high.

Total stocks of oats fell 14.5% to 2.0 million tonnes, driven primarily by a 14.2% drop in on-farm stocks. These declines occurred despite a 20.9% increase in oats production in 2011. Similarly, on-farm stocks of barley declined 9.6%, pushing total stocks down 10.8% to 5.1 million tonnes from December 31, 2010 levels. Barley production rose 2.0% in 2011. For both barley and oats, declines in total stocks have been recorded for the last 3 years.

For soybeans, total stocks rose 0.6% to 2.6 million tonnes, while production slipped 2.3% in 2011. On-farm stocks increased 20.2% to 1.8 million tonnes, compared with the same date a year earlier. This increase was driven by record on-farm storage levels of 1.1 million tonnes in Ontario. Meanwhile, commercial stocks fell 26.9% to 770,000 tonnes, their lowest level since 2003.

1. Commercial stocks include condominium stocks as of December 2003.

2. Animal feed, waste and dockage calculated residually.

3. Wheat in-transit at July 31, 2003 adjusted down by the Canadian Grain Commission to correct an historical anomaly in reported visible stocks.

1. Commercial stocks include condominium stocks as of December 2003.

2. Grain exports exclude seed.

3. Animal feed, waste and dockage calculated residually.

4. Some durum wheat is blended with other wheats and exported as wheat excluding durum.

5. May include small amount of use by food plants.

1. Grain exports and imports include seed.

# Concepts and definitions

---

## Definitions

**Stocks on farms:** farm held stocks of grains include marketable grain, reserves for on farm feed, seed use and dockage.

**Commercial stocks** (or in commercial positions): stocks of grain held at facilities such as elevators, terminals, mills, etc. Commercial stocks exclude dockage.

**Dockage:** dockage is material that must be removed from grain in order that the commodity can be assigned the highest grade for which it qualifies.

## Crop categories

**Major field crops:** wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

**Oilseeds:** canola, flaxseed, soybeans and sunflower seed.

**Major special crops:** dry peas, lentils, mustard seed, sunflower seed, canary seed and chick peas.

# Methodology and data quality

---

## Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, farms of First Nations reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the December Farm Survey is selected.

The target population for the December Farm Survey includes all farms in Canada enumerated in the Census of Agriculture except institutional farms, farms on First Nations reserves and farms from the Northwest Territories, Yukon, Nunavut and Atlantic region.

Probability surveys can use two types of sampling frames: list and area. In the December Farm Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of 10,560 farms was drawn from the list frame for the December 2011 Farm Survey.

## Data collection

The December 2011 Farm Survey was carried out from January 3 to January 10, 2012. Data collection is undertaken using the “Computer assisted telephone interview” (CATI) system.

## Edit and imputation

With the CATI system, it is possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

## Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 8 to 9%. The remainder of the sample unaccounted for can be explained by non-contact or non-response. Initial sample weights are adjusted by a process called “raising factor adjustment” in cases of total and partial non-response. No imputation is performed for missing values.

## Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not from the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling errors. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

## Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis, before final estimates are published.

Estimates of farm stocks of grains are obtained from the December Farm Survey, but a major tool used in the verification of these estimates is the farm supply-disposition (or supply-demand) balance sheet. This table reflects activity on farms only before grain enters the commercial system. The total supply and the disposition numbers must be equal.

The supply is composed of opening farm stocks and production. The disposition is comprised of deliveries, seed use, closing farm stocks as well as feed, waste and dockage. The production and farm stock data are estimated from the Farm Surveys conducted by Statistics Canada. Seed use data are based on average seeding rates.

A major portion of the deliveries are licensed grain deliveries obtained from the Canadian Grain Commission (CGC). Statistics Canada (StatCan) adjusts these deliveries during the estimation process to account for CGC quality problems and data lags. The adjustments are calculated mainly from commercial supply-demand tables using data available in the CGC publication *Grain Statistics Weekly*. However, the deliveries published in the StatCan farm supply-disposition tables reflect the CGC published data plus StatCan estimates for unlicensed deliveries to both domestic and export markets and to condominium storage.

The feed, waste and dockage (fwd) component is a residual in the balance sheet. Indicators such as the number of grain consuming animal units, harvest conditions affecting grain quality, established ratios of dockage to delivered grain and grain inspections are used to ensure data accuracy. An unusual estimate in this component may indicate a problem with another data series such as deliveries, or may show a change in feeding patterns. Farm stocks are estimated from survey indicators in conjunction with the other components of the balance sheet. Therefore, any apparent fwd anomalies are unlikely to reflect problems with the level of the farm stocks.

National supply and disposition tables provide further information to aid in estimating farm stocks. More detailed information on supply and disposition tables may be obtained in the October issue of Statistics Canada catalogue no. 22-007-X, *Cereals and Oilseeds Review*.

## Revisions

Stocks data are subject to revision for two years after first being published. Any revisions are generally published in the July 31 stocks report, which is released in September.

The following table contains some statistics which indicate the magnitude and direction of past revisions to the December 31 farm stocks estimates. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of revisions is indicated by counting the number of years that the preliminary estimate is above or below the final estimate. The data indicate, for example, that the preliminary estimates of on-farm wheat stocks are revised by a magnitude of, on average, 3.6% and usually in a upwards direction.

**Text table 1****Magnitude and direction of revisions to December 31 farm stocks estimates, Canada, 2001 to 2010**

Crop	Average percent change	Number of years December farm stocks estimates are revised:	
		Upwards	Downwards
	%	number	
Wheat	3.6	7	3
Oats	8.7	9	1
Barley	1.0	5	3
Flaxseed	2.5	3	2
Canola	8.0	7	3
Corn for grain	1.7	3	5
Soybeans	3.9	6	3

**Data quality**

The December 31 farm stocks estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the “coefficient of variation” (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations is less than twice the c.v. This range of values is referred to as the “confidence interval”. While published estimates may not exactly equal the level indicators due to the validation process, they do remain within the confidence interval of the survey level indicators. For the December Farm Survey, c.v. range from 5% to 10% for the major crops. Coefficients of variation for special crops are usually within 11% and 25%.

**Data confidentiality**

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

# Field crop reporting series calendar

## Catalogue 22-002-X

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 hrs, Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: [agriculture@statcan.gc.ca](mailto:agriculture@statcan.gc.ca)

Report No. and Title	2012 Release Dates
1 Stocks of principal field crops at December 31, 2011	February 3
2 March intentions of principal field crop areas	April 24
3 Stocks of principal field crops at March 31, 2012	May 7
4 Preliminary estimates of principal field crop areas	June 27
5 July estimates of production of principal field crops	August 22
6 Stocks of principal field crops at July 31, 2012	September 7
7 September estimates of production of principal field crops	October 4
8 November estimates of production of principal field crops	December 5

## Cereals and oilseeds review

### Catalogue 22-007-X

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.

For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: [agriculture@statcan.gc.ca](mailto:agriculture@statcan.gc.ca)
