#### **Note of appreciation**

*Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.*

# User information

---

## Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0<sup>s</sup> value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- P preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published
- \* significantly different from reference category ( $p < 0.05$ )

## Note on CANSIM

Data that appears in the **Industry Price Indexes** (catalogue no. 62-011-X) are also available electronically in our CANSIM (Canadian Socio-Economic Information Management System) database through the Internet tables 329-0056 to 329-0068 and 330-0007. In general, *CANSIM* provides a longer historical series. For further information on *CANSIM* call 1-800-263-1136.

## Revision

Unless otherwise stated, price indexes in this publication are subject to revision for the most recent six months shown. Any revisions beyond these limits are so indicated.

# Highlights

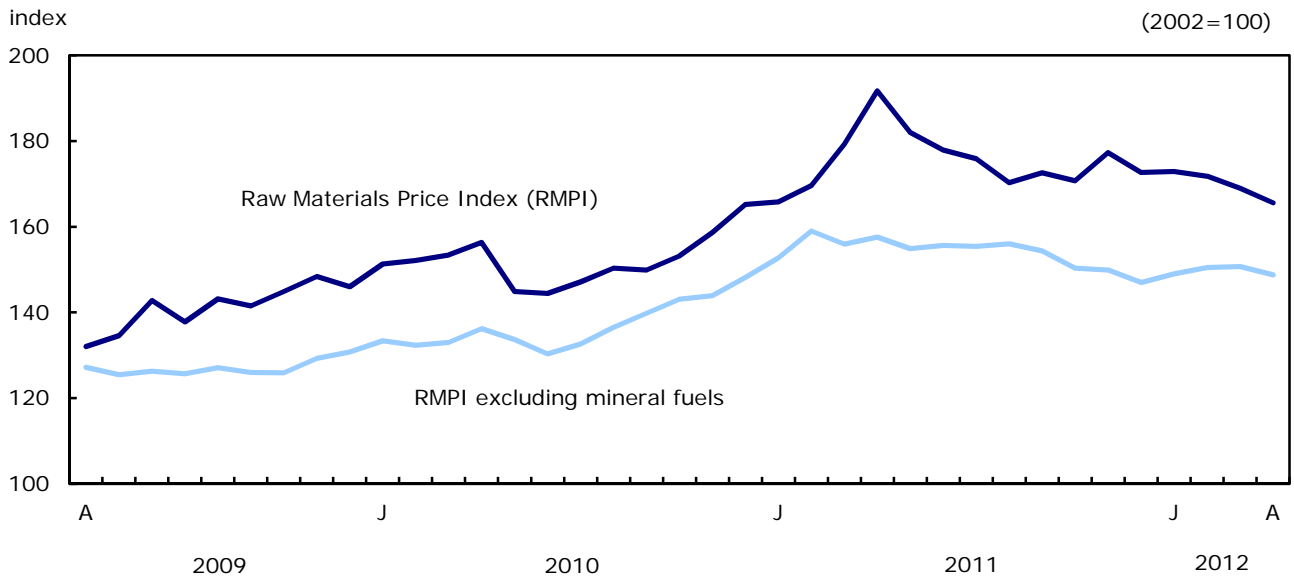

---

- Relative to March, the Industrial Product Price Index (IPPI) was unchanged in April.
- Increases in chemical products (+1.7%) and petroleum and coal products (+0.4%) were offset by a decline in primary metal products (-2.1%).
- The increase in chemical products was mainly attributable to fertilizers (+12.2%), specifically urea (+30.5%).
- Compared with the same month a year earlier, the IPPI rose 0.4% in April, led by higher prices for motor vehicles and other transportation equipment (+2.7%).
- The Raw Materials Price Index (RMPI) declined 2.0% in April, the third consecutive monthly decrease.
- The decline of the RMPI was moderated primarily by vegetable products (+1.4%), especially oilseeds (+6.5%) and grains (+1.3%).
- Compared with the same month a year earlier, the RMPI was down 13.6%, its second consecutive decrease.

## Analysis

---

Relative to March, the Industrial Product Price Index (IPPI) was unchanged in April. Increases in chemical products (+1.7%) and petroleum and coal products (+0.4%) were offset by a decline in primary metal products (-2.1%). The Raw Materials Price Index (RMPI) fell 2.0%, largely because of mineral fuels.

### Industrial Product Price Index, monthly change

After three consecutive advances, the IPPI was steady in April. Of the major commodity groups, eight were up, nine were down and four were unchanged.

Among the commodities that rose, chemical products (+1.7%) and petroleum and coal products (+0.4%) were the most influential.

The increase in chemical products was mainly attributable to fertilizers (+12.2%), specifically urea (+30.5%). Higher urea prices were partly a result of strong demand in the United States.

In addition to the increase in fertilizer prices, fruit, vegetables, feeds and other food products (+0.2%) posted a slight gain, largely attributable to feeds (+0.9%).

Petroleum and coal products were pushed upward mainly by gasoline prices (+2.7%), which posted their fourth consecutive gain.

In contrast, declines in prices of primary metal products (-2.1%), especially aluminum products (-3.7%), copper and copper alloy products (-4.5%), nickel products (-4.4%) and other non-ferrous metal products (-1.9%), partly offset the increases in chemicals and in petroleum and coal products.

Decreases were also observed in meat, fish and dairy products (-0.5%) and motor vehicles and other transportation equipment (-0.1%).

Some Canadian producers who export their products are generally paid on the basis of prices set in US dollars. Consequently, the 0.1% increase in the value the Canadian dollar relative to the US dollar in April had the effect of slightly reducing the corresponding prices in Canadian dollars. However, the exchange rate had a negligible impact on the index as a whole.

In April, the IPPI excluding petroleum and coal products edged down 0.1% for the second consecutive month.

### 12-month change in the Industrial Product Price Index

Compared with the same month a year earlier, the IPPI rose 0.4% in April. The slowdown of the growth of the index has continued since September 2011.

The increase in the IPPI was led by higher prices for motor vehicles and other transportation equipment (+2.7%).

More modest advances were observed in chemical products (+2.5%) and in fruit, vegetables, feeds and other food products (+2.2%).

The growth of the IPPI was moderated largely by a decrease in primary metal products (-9.4%), which posted a sixth consecutive decline. The largest contributors to the decrease were other non-ferrous metal products (-13.0%), nickel products (-29.3%), aluminum products (-11.1%) and copper and copper alloy products (-10.1%).

The 3.5% decline in the value of the Canadian dollar against the US dollar contributed to the growth of the index in April. Without the impact of the exchange rate, the IPPI would have fallen 0.4% instead of increasing 0.4%.

The IPPI excluding petroleum and coal products was up 0.5% relative to April 2011.

### **Raw Materials Price Index, monthly change**

The RMPI declined 2.0% in April, the third consecutive monthly decrease. The downward trend of the index was slightly more pronounced in April, following declines of 0.6% in February and 1.7% in March.

In April, the decrease of the index was mostly the result of mineral fuels (-2.8%), particularly crude petroleum (-2.6%).

Natural gas prices continued to fall in April, with an 8.1% decline. It was the ninth straight monthly decrease. Abundant supplies and high inventories in North America continued to drive prices down.

The decline of the RMPI was moderated primarily by vegetable products (+1.4%), especially oilseeds (+6.5%) and grains (+1.3%).

In the oilseeds group, higher prices were observed for canola (+6.2%) and soybeans (+6.3%). The increase in soybean and canola prices was partly attributable to a decline in global supply, especially in South America, where drought disrupted normal production.

The main contributors to the rise in grain prices were oats (+4.0%), wheat (+2.7%) and barley (+2.0%).

The RMPI excluding mineral fuels posted a 1.3% decrease in April, ending a string of three consecutive monthly advances.

### **12-month change in the Raw Materials Price Index**

Compared with the same month a year earlier, the RMPI was down 13.6%, its second consecutive decrease. The decline of the index was more pronounced in April, partly because it had reached an exceptionally high level a year earlier.

The index was pushed downward mainly by mineral fuels prices (-21.3%) and, to a lesser extent, non-ferrous metals (-12.2%).

Crude petroleum (-21.8%) was primarily responsible for the decline in mineral fuels, posting its second consecutive decrease.

All major non-ferrous metal product groups except precious metals were down. Among the main contributors to the decline were copper concentrates (-12.8%), other non-ferrous base metals (-21.1%), non-ferrous metal scrap (-10.6%) and zinc concentrates (-15.3%).

Year over year, the RMPI excluding mineral fuels declined 5.6% in April.

**Note to readers**

All data in this release are seasonally unadjusted and usually subject to revision for a period of six months (e.g., when the July index is released, the index for the previous January becomes final).

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including transportation, wholesale and retail costs.

Canadian producers export many goods. They often indicate their prices in foreign currencies, especially in US dollars, which are then converted into Canadian dollars. In particular, this is the case for motor vehicles, pulp, paper and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI. But the conversion into Canadian dollars only reflects how respondents provide their prices. Moreover, this is not a measure that takes into account the full effect of exchange rates, since that is a more difficult analytical task.

The conversion of prices received in US dollars is based on the average monthly exchange rate (noon spot rate) established by the Bank of Canada, and it is available on CANSIM in table 176-0064 (series v37426). Monthly and annual variations in the exchange rate, as described in the text, are calculated according to the indirect quotation of the exchange rate (for example, CAN\$1 = US\$X).

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of those prices are set on the world market. However, as few prices are denominated in foreign currencies, their conversion into Canadian dollars has only a minor effect on the calculation of the RMPI.

1. The aggregation of indexes by commodities or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative and the All Manufacturing Industries is adjusted to match.

**Note(s):** Indexes for the most recent six months shown are subject to revision.

**Table 2-1  
Industrial product price indexes, by commodity and commodity aggregations — Summary**

|  | Jan.     | Feb.  | Mar.  | Apr.  | May   | June  | July  | Aug.  | Sept. | Oct.  | Nov.  | Dec.  | Annual average |
|--|----------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|----------------|

**Note(s):** Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Table 3-3**  
**Industrial product price indexes by industry and industry groups — Beverage manufacturing and tobacco manufacturing**

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

Table 3-19

**Industrial product price indexes by industry and industry groups — Electrical equipment, appliance and component manufacturing**

|  | Jan.  | Feb.  | Mar.  | Apr.  | May   | June  | July  | Aug.  | Sept. | Oct.  | Nov.  | Dec.  | Annual average |
|--|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|----------------|

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

## Industrial Product Price Indexes (2002=100)

---

The Industrial Product Price Indexes (IPPI) measures price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 944 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 2002 Input-Output tables. Weights used to aggregate commodity indexes are taken from the output or “Make” matrix of the Input-Output tables of the Canadian System of National Accounts (SNA) which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (catalogue no. 11-001-X) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in tables 329-0056 to 329-0068 or by request.

Each release of index numbers is subject to revision for six months, (for example, when the July index is released, the index for the preceding January becomes final). Exceptions to this rule are announced.

### Price surveys

About 6,000 price quotes are collected monthly from about 1,700 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are “must take” respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 3 to 15 price quotes. An index may be derived from as few as 3 quotes or as many as 30 quotes.

Estimated percentage shares (by weight in the IPPI) of the collection methods used in the construction of the IPPI: Direct Mail survey (80%) Telephone Interviews (10%) Extraction of data from other sources (10%).

### Weight base

The composite indexes are weighted averages of the elemental indexes. For the IPPI, commodity and industry weights are taken from the output matrix of the 2002 Input-Output tables produced by the Industry Accounts Division of the Canadian System of National Accounts (SNA). These tables are derived from shipment values reported for the 2002 Annual Survey of Manufactures (ASM) and edited to conform to the industry classification (i.e. NAICS). However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns. The entire weighting scheme for the IPPI is generally revised every 5 years. The current time base and weight base is 2002=100.

## Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where  $w_i$  are the values of the output of each commodity:

Figure 1

### Industrial Product Price Index Equation

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$  denotes the composite price index movement between the base period  $o$  and time  $t$  for the defined aggregate;

$w^i$  is the transaction value of the element  $i$  in the base period;

$P_{t/o}^i$  is the price index for element  $i$ , meaning its price change from the base period to time  $t$ ;

$\sum_i$  indicates summation over all elements  $i$  in the defined aggregate.

## Historical data

The historical series consist of all data for the months prior to January 2002. They were obtained by linking together indexes from the 2002-based IPPI series and the corresponding 1997-based IPPI series. These historical series were obtained by rebasing the 1997-based IPPI series using, as the rebasing factor, the ratio of 100 to the annual average index of 2002.

Historical series on the 2002 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 2002 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. A set of CANSIM vector *concordance tables* between both sets of IPPI series are available to the public.

## Raw Materials Price Indexes (2002=100)

---

The Raw Materials Price Indexes (RMPI) measures price changes for raw materials purchased by industries in Canada for further processing. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product. For example, wheat is considered as a raw material, but wheat flour is not; iron ore is but not pig iron; coal is but not electricity. Approximately 80 commodities are priced in the index, grouped into seven major components. For the RMPI, commodity weights are taken from the input matrix of the 2002 Input-Output tables of the Canadian System of National Accounts (SNA).

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

The index and the major group indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (catalogue no. 11-001-X) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in tables 330-0007 or by request.

Each release of index numbers is subject to revision for six months, (for example, when the July index is released, the index for the preceding January becomes final). Exceptions to this rule are announced.

### Price surveys

Data are collected directly from survey respondents, extracted from administrative files and derived from other Statistics Canada surveys and/or other sources. As a purchasers' price index, prices include all charges purchasers incur to bring a commodity to the establishment gate. They include transportation charges, net taxes paid, custom duties, as well as subsidies, if applicable.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 3 to 15 price quotes. An index may be derived from as few as 3 quotes or as many as 30 quotes.

In the RMPI, approximately 34% of the data are collected by direct mail survey, 60% of the data from administrative sources and the remaining 6% from imputation, usually from a similar commodity at the next stage of processing.

### Weight base

The composite indexes are weighted averages of the elemental indexes. For the RMPI, commodity weights are taken from the input matrix of the 2002 Input-Output tables produced by the Industry Accounts Division of the Canadian System of National Accounts (SNA). These tables provide values at purchasers' prices of commodities purchased as intermediate inputs. Within individual commodity indexes, the prices are weighted according to their market share. If data are not available, the prices are equally weighted. Each December, product weights within a commodity index can be changed in order to reflect important changes in production patterns. The entire weighting scheme for the RMPI is generally revised every 5 years. The current time base and weight base is 2002=100.

### Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

Indexes for aggregates of individual raw materials are calculated according to the following formula:

**Figure 2**

**Raw Materials Price Index Equation**

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$  denotes the composite price index movement between the base period  $o$  and time  $t$  for the defined aggregate;

$w^i$  is the transaction value of the element  $i$  in the base period;

$P_{t/o}^i$  is the price index for element  $i$ , meaning its price change from the base period to time  $t$ ;

$\sum_i$  indicates summation over all elements  $i$  in the defined aggregate.

**Historical data**

The historical series consist of all data for the months prior to January 2002. They were obtained by linking together indexes from the 2002-based RMPI series and the corresponding 1997-based RMPI series. These historical series were obtained by rebasing the 1997-based RMPI series using, as the rebasing factor, the ratio of 100 to the annual average index of 2002. A set of CANSIM vector *concordance tables* between both sets of RMPI series are available to the public.

## Electric Power Selling Price Indexes, Non-residential (2009=100)

---

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 2009 as a time reference base and the weights used are 2009 company revenues from sales of electricity, as collected by Producer Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 2009 =100. The indexes are available on CANSIM in table 329-0073. Indexes for the current year and the previous year are subject to revision.

# Appendix I

---

## Use of Link factors for IPPI and RMPI

To convert a 2002-based index to a 1997 base, just look for the appropriate link factor in the following appendix tables and multiply the index of the 2002 based series by that factor. Expressed as a formula, the calculation is:

$$P_{t/02} \times f = P_{t/97}$$

where  $P_{t/02}$  is a 2002-based index,  $P_{t/97}$  is a 1997-based index and  $f$  is the link factor.

Conversely, to convert the 1997-based index to a 2002 base, just look for the appropriate link factor in the following appendix tables and divide the index of the 1997 based series by that factor. Expressed as a formula, the calculation is:

$$P_{t/97} \div f = P_{t/02}$$

Link factors are available upon request. For more information, or to enquire about the concepts, methods or data quality of this release, contact Statistics Canada's National Contact Centre (toll-free 1-800-263-1136; 613-951-8116; [infostats@statcan.gc.ca](mailto:infostats@statcan.gc.ca)) or the Media Hotline (613-951-4636), Communications Division.
