

October 20 to 26, 2013 (Week 43)

Overall Summary

- Influenza activity in Canada increased slightly in week 43.
- While rhinovirus and parainfluenza continued to be the predominant respiratory viruses in circulation in week 43, laboratory detections of influenza increased.
- Both paediatric and adult hospitalizations with influenza were reported in week 43.
- After increasing in late September, the ILI consultation rate has been stable in weeks 40-43.

Note: The presentation of the FluWatch report has been updated for the 2013-14 influenza season in order to improve the readability and interpretation of the report. Graphs and tables related to influenza activity levels, laboratory data and ILI data have been modified. Additional graphs and tables were added to the sections related to surveillance of antiviral prescriptions and hospitalizations with influenza.

Influenza/ILI Activity (geographic spread)

In week 43, seven regions (in BC(1), AB(2), ON(2) and QC(2)) reported sporadic activity (Figure 1). The number of regions reporting sporadic activity has increased over the past two weeks.

Figure 1. Map of overall influenza/ILI activity level by province and territory, Canada, Week 43

Note: Influenza/ILI activity levels, as represented on this map, are assigned and reported by Provincial and Territorial Ministries of Health, based on laboratory confirmations, sentinel ILI rates and reported outbreaks. Please refer to detailed definitions at the end of the report. Maps from previous weeks, including any retrospective updates, are available on the [FluWatch website](#).

Influenza and Other Respiratory Virus Detections

The number of positive influenza tests increased from a range of 3 to 7 over weeks 35 to 42, to 21 in week 43. The percentage of positive influenza tests increased slightly from 0.2% in week 42 to 1.0% in week 43 (Figure 2). Among the 21 influenza viruses detected in week 43, 62% were influenza A. Cumulative influenza virus detections by type/subtype to date have been predominantly influenza A (72%) with a nearly equal mix of A(H3) and A(H1N1)pdm09 among those subtyped (Table 1). Detailed information on age and type/subtype has been received for 49 cases to date this season. The majority of cases have been adults 45-64 years of age (49%), followed by children under 5 years of age (22%) (Table 2).

Figure 2. Number of positive influenza tests and percentage of tests positive, by type, subtype and report week, Canada, 2013-14

The number of positive tests for both rhinovirus and parainfluenza declined in week 43, although they remained the predominant viruses detected. The number of positive tests for both adenovirus and RSV increased slightly. The numbers of positive tests for human metapneumovirus and coronavirus remained low in week 43 (Figure 3). For more details, see the weekly [Respiratory Virus Detections in Canada Report](#).

Figure 3. Number of positive laboratory tests for other respiratory viruses by report week, Canada, 2013-14

RSV: Respiratory syncytial virus; hMPV: Human metapneumovirus

Table 1. Weekly and cumulative numbers of positive influenza specimens by type, subtype and province, Canada, 2013-14

Reporting provinces ¹	Weekly (October 20 to October 26, 2013)					Cumulative (August 25, 2013 to October 26, 2013)

¹ Specimens from NT, YT, and NU are sent to reference laboratories in other provinces. Cumulative data includes updates to previous weeks.

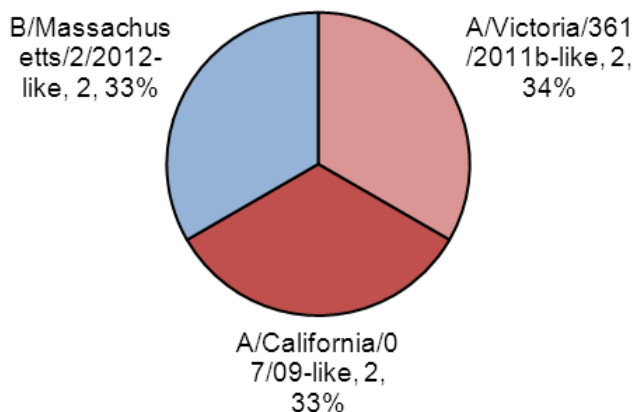

² Percentage of tests positive for sub-types of influenza A are a percentage of all influenza A detections.

³ Table 2 includes specimens for which demographic information was reported. These represent a subset of all positive influenza cases reported. UnS: unsubtype: The specimen was typed as influenza A, but no result for subtyping was available.

Influenza Strain Characterizations

During the 2013-2014 influenza season, the National Microbiology Laboratory (NML) has antigenically characterized six influenza viruses [two A(H3N2), two A(H1N1)pdm09 and two influenza B]. All viruses were similar to the strains recommended by the WHO for the 2013-14 seasonal influenza vaccine (Figure 4).

Figure 4. Influenza strain characterizations, Canada, 2013-14, N = 6

The NML receives a proportion of the number of influenza positive specimens from provincial laboratories for strain characterization and antiviral resistance testing. Characterization data reflect the results of haemagglutination inhibition (HAI) testing compared to the reference influenza strains recommended by WHO.

The recommended components for the 2013-2014 northern hemisphere trivalent influenza vaccine include: an A/California/7/2009 (H1N1)pdm09-like virus, an A(H3N2) virus antigenically like the cell-propagated prototype virus A/Victoria/361/2011b, and a B/Massachusetts/2/2012-like virus (Yamagata lineage).

Antiviral Resistance

During the 2013-2014 influenza season, NML has tested six influenza viruses for resistance to oseltamivir and zanamivir, and all were sensitive. Four influenza A viruses were tested for amantadine resistance, and all were resistant (Table 3).

Table 3. Antiviral resistance by influenza virus type and subtype, Canada, 2013-14

Virus type and subtype	Oseltamivir		Zanamivir		Amantadine	
	# tested	# resistant (%)	# tested	# resistant (%)	# tested	# resistant (%)

A (H1N1)	2	0	2	0	2	2 (100%)
B	2	0	2	0	NA ¹	NA ¹
TOTAL	6	0	6	0	4	4 (100%)

¹ NA – not applicable

Influenza-like Illness Consultation Rate

The national influenza-like-illness (ILI) consultation rate decreased slightly from 23.4/1,000 in week 42 to 20.4/1,000 in week 43 (Figure 5).

Figure 5. Influenza-like-illness (ILI) consultation rates by report week, compared to the 1996-97 through to 2012-13 seasons (with pandemic data suppressed), Canada, 2013-14

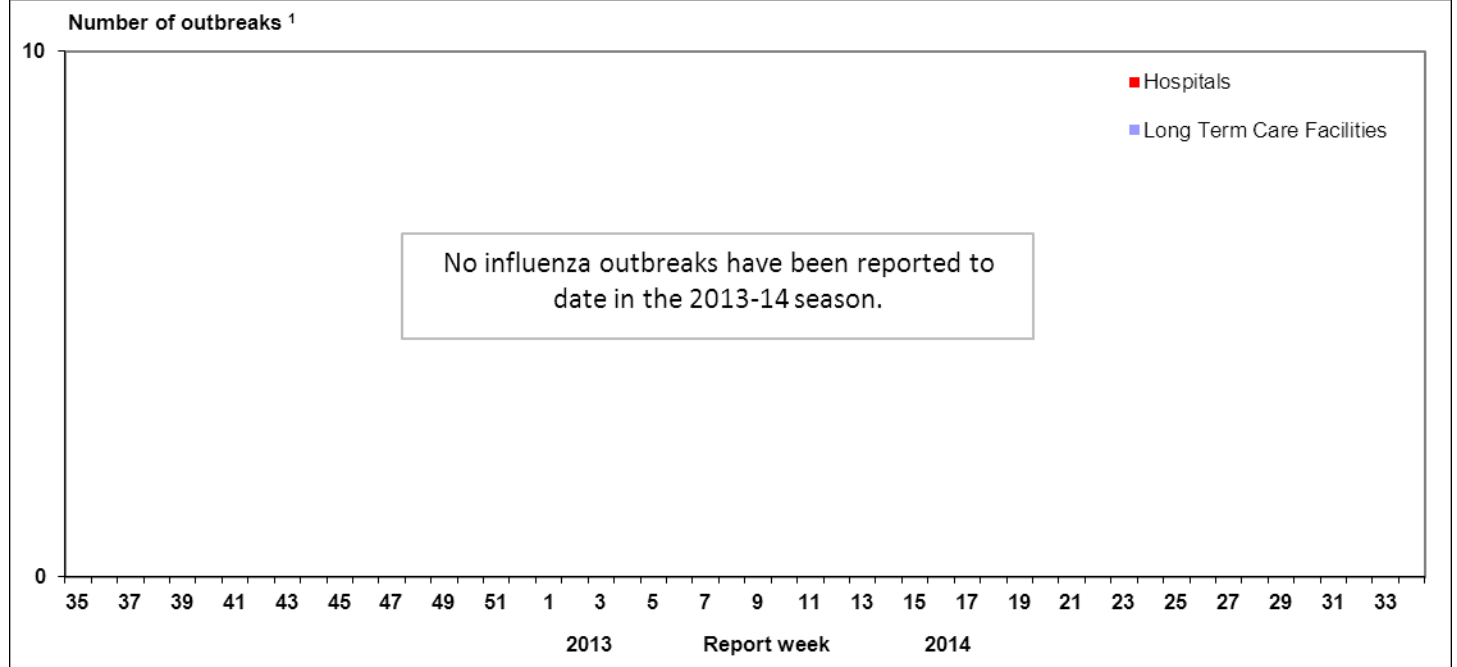

No data available for mean rate for weeks 19 to 39 for the 1996-1997 through 2002-2003 seasons. Delays in the reporting of data may cause data to change retrospectively. The calculation of the average ILI consultation rate over 17 seasons was aligned with influenza activity in each season. In BC, AB, and SK, data is compiled by a provincial sentinel surveillance program for reporting to FluWatch. The number of sentinel physicians in each province or territory is as follows: BC(21), AB(80), SK(11), MB(18), ON(169), QC(14), NB(29), NS(26), PE(4), NL(16), NU(1), NT(14), YT(13). Not all sentinel physicians report every week.

Influenza Outbreak Surveillance

No new influenza outbreaks were reported in week 43 (Figure 6).

Figure 6. Overall number of new influenza outbreaks by report week, Canada, 2013-2014

All provinces and territories except NU report influenza outbreaks in long-term care facilities. All provinces and territories with the exception of NU and QC report outbreaks in hospitals. Outbreaks of influenza or influenza-like-illness in other facilities are reported to FluWatch but reporting varies between jurisdictions. Outbreak definitions are included at the end of the report.

Pharmacy Surveillance

Pharmacy surveillance for sales of influenza antivirals has not yet begun for the 2013-14 influenza season (Figure 7).

Figure 7 – Proportion of prescription sales for influenza antivirals by age-group and week, Canada, 2013-14

Note: Pharmacy sales data are provided to the Public Health Agency of Canada by Rx Canada Inc. and sourced from major retail drug chains representing over 3,000 stores nationwide (excluding Nunavut) in 85% of Health Regions. Data provided include the number of new antiviral prescriptions (for Tamiflu and Relenza) and the total number of new prescriptions dispensed by Province/Territory and age group. Age-groups: Infant: 0-2y, Child: 2-18y; Adult: 19-64y, Senior: ≥65y

Sentinel Hospital Influenza Surveillance

Paediatric Influenza Hospitalizations and Deaths (IMPACT)

In week 43, two laboratory-confirmed influenza-associated paediatric (≤ 16 years of age) hospitalizations were reported by the Immunization Monitoring Program Active (IMPACT) network: one child 0-5 months of age and one 2-4 years of age, both with influenza B (Figure 8a).

To date this season, a total of five influenza-associated paediatric hospitalizations have been reported by the IMPACT network: two children 0-5 months of age and three 2-4 years of age. One ICU admission was required in a child 2-4 years of age with influenza B. No deaths have been reported (Figure 9a and Table 4).

Note: The number of hospitalizations reported through IMPACT represents a subset of all influenza-associated paediatric hospitalizations in Canada. Delays in the reporting of data may cause data to change retrospectively.

Adult Influenza Hospitalizations and Deaths (PCIRN)

Active surveillance of laboratory-confirmed influenza-associated adult (≥ 16 years of age) hospitalizations reported by the PHAC/CIHR Influenza Research Network (PCIRN) Serious Outcomes Surveillance (SOS) network will begin on November 15th 2013. The PCIRN-SOS network continues to report limited data on laboratory-confirmed cases of influenza identified through passive surveillance. Two new hospitalizations were reported in week 43, one 45-64 years of age and one ≥ 65 years of age, both with influenza A. No ICU admissions or deaths were reported in week 43 (Figure 8b).

To date this season, five influenza-associated hospitalizations have been reported by the PCIRN-SOS network, all adults over 45 years of age with influenza A. ICU admission was required for one hospitalization and no deaths have been reported (Figure 9b and Table 5).

Note: The number of hospitalizations reported through PCIRN represents a subset of all influenza-associated adult hospitalizations in Canada. Delays in the reporting of data may cause data to change retrospectively.

Table 4 – Cumulative numbers of paediatric hospitalizations with influenza reported by the IMPACT network, Canada, 2013-14

Age groups	Cumulative (Aug. 25, 2013 to Oct. 26, 2013)

Figure 9 – Percentage of hospitalizations, ICU admissions and deaths with influenza reported by age-group, Canada, 2013-14

A) Paediatric hospitalizations (≤16 years of age, IMPACT)

B) Adult hospitalizations (≥16 year of age, PCIRN-SOS)

Provincial/Territorial Influenza Hospitalizations and Deaths

In week 43, six new laboratory-confirmed influenza-associated hospitalizations were reported from participating provinces and territories.* The cases were as follows: two children 0-4 years of age, both with influenza B; one child 5-14 years of age with influenza B; two adults 45-64 years of age with influenza A(H3N2) and influenza A(unsupported); and one adult ≥65 years of age with influenza A(H1N1)pdm09. No ICU admissions or deaths were reported.

To date this season, 13 influenza-associated hospitalizations have been reported, predominantly among children 0-4 years of age and adults 45-64 years of age (Table 6). There is no predominance of one influenza type or subtype among these cases to date. Consistent with the data from IMPACT and PCIRN-SOS, there is a greater proportion of cases of influenza B among children under 5 years of age compared to adults over 45 years of age. One ICU admission was reported in an adult 45-64 years of age and no deaths have been reported. It is important to note that the cause of death does not have to be attributable to influenza, a positive laboratory test is sufficient for reporting. Detailed clinical information (e.g. underlying medical conditions) is not known for these cases.

* Note: Data from the Aggregate Surveillance System may also include cases reported by the IMPACT and PCIRN networks. Influenza-associated hospitalizations are not reported to PHAC by the following Provinces and Territory: BC, NU, QC, NS, and NB. Only hospitalizations that require intensive medical care are reported by Saskatchewan. ICU admissions are not reported in Ontario.

Table 6 – Cumulative number of hospitalizations with influenza reported by the participating provinces and territories, Canada, 2013-14

Age groups (years)	Cumulative (Aug. 25, 2013 to Oct. 26, 2013)

Emerging Respiratory Pathogens

Human Avian Influenza

Influenza A(H7N9): No new cases of human infection with avian influenza A(H7N9) have been reported by the World Health Organization (WHO) since 24 October 2013. As of 1 November 2013, WHO has been informed of 137 laboratory-confirmed human cases with avian influenza A(H7N9), including 45 deaths.

[PHAC – Avian influenza A\(H7N9\)](#)

[WHO – Avian Influenza A\(H7N9\)](#)

Human Swine Influenza

Influenza A(H3N2)v: No new cases of human infection with influenza A(H3N2)v were reported in week 43. To date in 2013, a total of 21 A(H3N2)v cases have been reported, and one person has been hospitalized.

[Centers for Disease Control and Prevention Influenza A\(H3N2\) Variant Virus](#)

Middle East Respiratory Syndrome Coronavirus (MERS-CoV)

Since 25 October 2013, WHO has reported five additional cases, including one death, of MERS-CoV infection in Saudi Arabia (3), Qatar (1), and Oman (1). Of the cases reported in Saudi Arabia, one is a woman and two are men, ranging in age from 49 to 83 years. The three patients, one of whom is a health care worker, have underlying medical conditions. All three reported having no contact with animals prior to their illness, and one patient was reported to have been in contact with a previously confirmed case. The case reported in Qatar is a 23 year old male with mild symptoms and worked in a barn owned by a previously confirmed case. The case in Oman is the first to be reported in the country. Preliminary epidemiological investigations revealed that the 68 year old male did not recently travel outside the country, with investigations ongoing. As of 1 November 2013, 149 laboratory-confirmed cases of human infection with MERS-CoV have been reported, including 63 deaths. Most patients are male (65%, 91/141) and range in age from 2 to 94 years of age (median 55 years, n=143).

FluWatch Definitions for the 2013-2014 Season

Abbreviations: Newfoundland/Labrador (NL), Prince Edward Island (PE), New Brunswick (NB), Nova Scotia (NS), Quebec (QC), Ontario (ON), Manitoba (MB), Saskatchewan (SK), Alberta (AB), British Columbia (BC), Yukon (YT), Northwest Territories (NT), Nunavut (NU).

Influenza-like-illness (ILI): Acute onset of respiratory illness with fever and cough and with one or more of the following - sore throat, arthralgia, myalgia, or prostration which is likely due to influenza. In children under 5, gastrointestinal symptoms may also be present. In patients under 5 or 65 and older, fever may not be prominent.

ILI/Influenza outbreaks

- **Schools:** Greater than 10% absenteeism (or absenteeism that is higher (e.g. >5-10%) than expected level as determined by school or public health authority) which is likely due to ILI. Note: it is recommended that ILI school outbreaks be laboratory confirmed at the beginning of influenza season as it may be the first indication of community transmission in an area.
- **Hospitals and residential institutions:** two or more cases of ILI within a seven-day period, including at least one laboratory confirmed case. Institutional outbreaks should be reported within 24 hours of identification. Residential institutions include but not limited to long-term care facilities (LTCF) and prisons.
- **Workplace:** Greater than 10% absenteeism on any day which is most likely due to ILI.
- **Other settings:** two or more cases of ILI within a seven-day period, including at least one laboratory confirmed case; i.e. closed communities.

Note that reporting of outbreaks of influenza/ILI from different types of facilities differs between jurisdictions.

Influenza/ILI Activity Levels

- 1 = No activity: no laboratory-confirmed influenza detections in the reporting week, however, sporadically occurring ILI may be reported
- 2 = Sporadic: sporadically occurring ILI and lab confirmed influenza detection(s) with **no outbreaks** detected within the influenza surveillance region†
- 3 = Localized: (1) evidence of increased ILI* ;
(2) lab confirmed influenza detection(s);
(3) **outbreaks** in schools, hospitals, residential institutions and/or other types of facilities occurring in **less than 50% of the influenza surveillance region†**
- 4 = Widespread: (1) evidence of increased ILI*;
(2) lab confirmed influenza detection(s);
(3) **outbreaks** in schools, hospitals, residential institutions and/or other types of facilities occurring **in greater than or equal to 50% of the influenza surveillance region†**

Note: ILI data may be reported through sentinel physicians, emergency room visits or health line telephone calls.

* More than just sporadic as determined by the provincial/territorial epidemiologist.

† Influenza surveillance regions within the province or territory as defined by the provincial/territorial epidemiologist.

We would like to thank all the Fluwatch surveillance partners who are participating in this year's influenza surveillance program.
