ABSTRACT

Workman G. D., J. Fargo, B. Beall, and E. Hildebrandt. 1997. R/V W. E. RICKER and F/V STEADFAST trawl survey of Hecate Strait, May 30 - June 13, 1996. Can. Data Rep. Fish. Aquat. Sci. 1010: 155 p.

During the period May 30 to June 13, 1996, the R/V W.E. RICKER (WER) and the F/V STEADFAST (STD) conducted a two vessel trawl survey of groundfish species in Hecate Strait. Previous surveys have been conducted in May-June 1984, February 1986, May-June 1987, 1989, June 1991 and May-June 1993, 1995. The primary objective of the survey was to collect catch composition and biological data on all species occupying the shelf area (10 to 80 fm) of Hecate Strait. The secondary objective of the current survey was to collect catch data from both a research and a commercial vessel for comparison. The WER completed 106 hauls during the survey; the STD completed 53 hauls including 48 replicates. The WER's catch of 46,439 kg included 52 species of fish. Flatfish accounted for 59.3 % of the catch, roundfish 19.7 %, selachii 19.4 %, rockfish 1.4 % and invertebrates 0.3 %. The STD caught 28,670 kg comprising 36 species. Flatfish accounted for 47 %, selachii 35 %, roundfish 15 %, rockfish 1.4 % and invertebrates 1.0%. Length frequency data were collected from 1,401 Pacific cod, 11,049 rock sole, 15,390 English sole, 3,737 Dover sole and 658 Pacific halibut. Otoliths were collected from 386 rock sole, 148 English sole, and 123 Dover sole. In addition, 97 CTD casts were completed during the survey. The current report summarizes the bridge log data, catch data, biological data and oceanographic data collected.

RÉSUMÉ

Workman G. D., J. Fargo, B. Beall, and E. Hildebrandt. 1997. R/V W. E. RICKER and F/V STEADFAST trawl survey of Hecate Strait, May 30 - June 13, 1996. Can. Data Rep. Fish. Aquat. Sci. 1010: 155 p.

Dans la période du 30 mai au 13 juin 1996, le navire de recherche W.E. RICKER (WER) et le bateau de pêche STEADFAST (STD) ont effectué un relevé de chalutage en double portant sur les espèces de poisson de fond du détroit d'Hécate. Des campagnes avaient déjà eu lieu en mai-juin 1984, février 1986, mai-juin 1987 et 1989, juin 1991 et mai-juin 1993 et 1995. Le premier objectif du relevé était de recueillir des données biologiques et d'étudier la composition des prises pour toutes les espèces qui occupent la région du plateau continental (10 à 80 brasses) dans le détroit. L'objectif secondaire était de recueillir des données sur les prises d'un bateau de pêche commerciale et d'un bâtiment de recherche pour les comparer. Le WER a réalisé 106 traits pendant le relevé, et le STD 53 traits, dont 48 de répétition. Dans les 46 439 kg des prises du WER, on comptait 52 espèces. Les poissons plats constituaient 59,3 % des prises, les poissons ronds 19,7 %, les sélaciens 19,4 %, les sébastes 1,4 % et les invertébrés 0,3 %. Le STD a ramené des prises de 28 670 kg, constituées de 36 espèces. Les poissons plats en représentaient 47 %, les sélaciens 35 %, les poissons ronds 15 %, les sébastes 1,4 % et les invertébrés 1,0 %. Des données sur la fréquence des longueurs ont été recueillies à partir de 1 401 morues pacifiques, 11 049 soles pacifiques, 15 390 carlottins anglais, 3 737 limandes-soles et 658 flétans pacifiques. Les otolithes ont été prélevés sur 386 soles pacifiques, 148 carlottins anglais et 123 limandes-soles. De plus, on a effectué 97 largages de sondes CTD pendant la campagne. Le rapport résume les données du journal de passerelle, l'information sur les prises et les données biologiques et océanographiques recueillies.

INTRODUCTION

Between May 30 and June 13, 1996 we conducted a bottom trawl survey of Hecate Strait. This was the eighth in a series of surveys initiated in the summer of 1984. Previous summer surveys were conducted in 1984, 1987, 1989, 1991, 1993 and 1995 (Fargo *et al.* 1984, 1988; Westrheim *et al.* 1984; Antonsen *et al.* 1990; Wilson *et al.* 1991; Hand *et al.* 1994; Workman *et al.* 1996). A winter survey in 1986 was conducted to investigate seasonal changes in species distributions and abundances (Fargo and Davenport 1986; Foucher *et al.* 1988). Analyses of these data have been summarized by Tyler (1989), Fargo *et al.* (1990) and Fargo and Tyler (1991, 1992). Information from the surveys is used for stock assessment purposes at the Pacific Biological Station.

Objectives of the 1996 survey included:

- Increasing the number of hauls in selected strata to reduce the variance in the CPUE index.
- Obtaining CPUE data for comparison between a commercial vessel and the research vessel.
- Providing more comprehensive data for stock assessment.

This report presents the results of the 1996 survey, including summaries of catch, biological and oceanographic data. A detailed comparison of catch rates between the research vessel W.E. RICKER and the commercial trawler STEADFAST will be the subject of a subsequent report.

METHODS

VESSELS AND GEAR

The R/V W.E. RICKER (WER) is a 2500 hp, 57.3 m steel stern trawler which has been used for the survey since 1991. The vessel layout includes three net drums and two main winches with approximately 600 fms of 1 1/8 in warp cable. The net used by WER for the survey was a Yankee 36 trawl of heavy construction (Fig. 1). For a full description see Workman *et al.* (1996).

The F/V STEADFAST (STD) is a 380 hp, 20 m steel stern trawler that was chartered to replicate hauls completed by the WER during the first half of the survey. The information from replicate hauls will be used to compare the performance of the two vessels. The net used by the STD was a Safari 5 with 152 mm (6 in) mesh body

and codend (Fig. 2). The headrope was 21.9 m (72 ft) and the footrope was 28.8 m (93 ft). There were 40 203 mm (8 in) diameter floats attached to the headrope. The bosom section of the groundline consisted of 30 cm (12 in) roller gear. The wing sections consisted of 30 cm (12 in) rock hopper disks. The sweeps and bridles were 27.3 m (90 ft) and an additional set of bridles ran off the main bridles, one off the bottom and two off the top. These sections were 9.1 m (30 ft) long. The doors used by the STD were 2.34 m (92 in) Thyboron Type 2.

SURVEY DESIGN

The survey design has been described in Westrheim *et al.* (1984) and Fargo *et al.* (1984). Briefly, the survey area encompasses Hecate Strait and part of Dixon Entrance, from 52° 30' N to 54° 30' N and from 130° 5' W to 131° 45' W. The survey covers a depth range of 10 to 80 fm (Fig. 3). The area has been divided into 10 nmi² blocks. Within each block, each 10 fm depth interval is a sampling strata (Fargo and Tyler 1991). The objective of the survey is to make one haul in each sampling strata in each block.

FISHING OPERATIONS

Fishing occurred during daylight hours only. Hauls were 30 min in duration, measured from the time the warp drums were locked to the time net retrieval began. For replicate hauls, the STD waited until the WER had locked its warps and then set off the port or starboard stern quarters, usually within 1/8 nm of the WER.

CATCH PROCESSING

Once the net was retrieved by the WER, the codend was dumped into a hopper below deck. The catch moved along a conveyer system and was sorted by species into baskets of approximately 50 kg capacity. Baskets were weighed to the nearest kilogram using a MAREL 2200 digital scale with a 60 kg load cell. On the STD, the net was hauled back and the codend was dumped into a checker on deck. Then the catch was sorted by species into 50 kg baskets. A platform balance was used for weighing the sorted catch.

BIOLOGICAL DATA

Biological data on length, sex, maturity, weight and age were collected for Pacific cod, rock sole, Dover sole and English sole. Large catches of individual species were sub-sampled for biological data by randomly selecting three 50 kg baskets (Westrheim, 1967). Fish sampled for length, sex, maturity and double sagital otoliths were measured to the nearest millimeter and weighed to the nearest gram using a MAREL 2200 digital top loading scale with a capacity of 6 kg. Otoliths were extracted, cleaned and stored in a 50:50 solution of glycerin/water with 1 g thymol added per litre. Maturities were determined macroscopically using the criteria in Appendix Table 1.

Length-weight data were collected by sex for rock sole, Dover sole and English sole. Length-weight data (sexes combined) were also collected for Pacific halibut. The data were fitted to an allometric model where weight (W) varies as a power of length (L):

$$W=a(L^b)$$

A nonlinear least-squares minimization procedure (SAS procedure NLIN, SAS/STAT User's Guide, Volume 2) was used to estimate parameters *a* and *b* and their associated 95 % confidence intervals.

OCEANOGRAPHIC DATA

Following each haul, a CTD cast was made using a Guildline CTD, series 8770, model 87107. At each station the CTD probe was lowered to within 10-15 m of the bottom before being retrieved. The CTD recorded measurements of temperature and conductivity at 0.1 m intervals during the descent of the probe. Cast procedures are summarized by Shaw (1994). All CTD data processing was done using IOSSHELL (Pearson, 1994). Several problems arose during the initial conversion of the raw acquisition data. All the cast files lacked calibration and channel data in the headers. In addition, five casts (14,23,24,25 and 37) had to be corrected for a surface offset of 2.1 to -3.0 dBars. Additional processing was required to correct corrupted salinity data in casts 78 and 94. The corrupt values were replaced with linearly interpolated values. Once these corrections were made the files were processed using the following functions in IOSSHELL: CLEAN, CALIBRATE, DESPIKE, DELETE, CLEAN, BOXCAR, BINAVE. During the final processing step the data were averaged into 1 m bins for plotting.

RESULTS

FISHING OPERATIONS

The WER completed 106 hauls during the survey (Fig. 4) of which 105 were usable. Of the usable hauls, 5 were new trawl sites, 4 of which were in McIntyre Bay (M1-M4; Fig. 4). Haul 90 was deemed unusable as a result of net damage. The WER replicated station J402 four times, I302 three times, E402, B302 and C301 twice and B201, B301, D303, F202, F302, F303, H201, H304, K403 and K404 once (Table 1). The STD completed 53 hauls (Fig. 5), of which haul 11 was deemed unusable due to gear hang-up. The STD replicated stations C301 and E402 twice and stations B302, D303, H304 and J402 once. Haul 7 was a new site and hauls 48-51 were in McIntyre Bay in Dixon Entrance (Table 2). The latter hauls were added in order to collect biological data for the rock sole population in this area. One haul was made by each vessel in each of four depth strata, 10-19 fm, 20-29 fm, 30-39 fm and 40-49 fm.

CATCH DATA

The WER caught a total of 46,439 kg in 105 hauls, comprised of 52 species (Table 3). Flatfish accounted for 27,553 kg (59.3 %), roundfish 9,127 kg (19.7 %), rockfish 646 kg (1.4 %), selachii 8,993 kg (19.4 %) and invertebrates 120 kg (0.3 %). The dominant species by weight were arrowtooth flounder, English sole, spotted ratfish, rock sole, walleye pollock, Pacific halibut, spiny dogfish and rex sole. These species accounted for 34,852 kg or 75% of the total catch. Records of the catch by haul along with the bridge log information are presented in Appendix Table 2.

The STD completed 52 hauls catching a total of 28,670 kg comprised of 36 species (Table 4). Flatfish accounted for 13,759 kg (47 %), selachii 10,002 kg (35 %), roundfish 4,318 kg (15 %), rockfish 400 kg (1.4 %), and invertebrates 191 kg (1 0 %). The dominant species by weight were spotted ratfish, arrowtooth flounder, English sole, lingcod, skates and Pacific halibut. These species accounted for 20,773 kg or 72 % of the total catch. Records of the catch of the STD by haul along with the bridge log information are presented in Appendix Table 3.

A detailed analysis comparing catch rates between the WER and the STD will be presented in Fargo and Workman (in prep.).

BIOLOGICAL DATA

A total of 25,188 length measurements was taken aboard the WER (Table 5). In addition, length, sex, weight and otolith samples were collected for rock sole, English sole, Dover sole and quillback rockfish. Aboard the STD, 7,050 length measurements were taken (Table 6). The total numbers of fish caught in sub-sampled hauls were estimated using the ratio of the numbers sampled to the weight sampled (Hand *et al.* 1994) (Tables 7 and 8). Summary statistics for the length data for each vessel are presented in Tables 9 and 10. Length frequency data for Pacific cod, rock sole, Dover sole, English sole and Pacific halibut sampled aboard the WER and the STD are presented in Appendix Tables 4 to 13 and illustrated in Figs. 6 to 10. Length-sex-maturity-otolith data for rock sole, Dover sole, English sole and quillback rockfish sampled aboard the WER are presented in Appendix Tables 14 to 17.

Statistical summaries of the length-weight relationships for selected species are presented in Table 11 and Figs. 11-14. Rock sole females weighed more than males over the entire size range. Small Dover sole females weighed more than males, but after a length of 30 cm males weighed more. However, the latter observation depends on only four measurements. English sole males weighed more than females until a length of 27 cm when females surpassed males in weight.

Rock sole sampled from McIntyre Bay (MB) had different biological characteristics than those encountered in Hecate Strait (HS) (Appendix Table 14). In MB, 93 % of the rock sole sampled were females compared to 53 % in HS. Mature fish comprised 95 % of the samples in MB compared to 73 % in HS. Of the mature fish, 81 % were in a resting stage of maturity in MB compared to 54 % in HS. Mean length and mean weight of fish sampled in MB were 402 mm and 929 g compared to 319 mm and 517 g for HS. Differences in the latter were the result of differences in the sex ratio between the two areas.

Muscle and liver samples were obtained from 30 specimens each of rock sole, Dover sole, English sole and Pacific halibut. These samples will be used for electrophoretic work on species/stock identification.

OCEANOGRAPHIC DATA

A total of 97 CTD casts was made during the survey. The vertical profile for each cast is presented in Appendix Fig. 1. The data are archived at the Institute of Ocean Sciences in Sydney, B.C. (CTD data archive reference number 9617). Surface temperatures ranged from 9.05-11.25 °C (Fig. 15) while bottom temperature ranged from 6.25-11.20 °C (Fig. 16). Surface temperatures were highest on Dogfish Bank and lowest in Dixon Entrance. The water column was isothermal at four stations (C201,

H201, G301, and J401). The thermocline generally occurred at around 20 m. Surface salinities ranged from 29.85-31.71 ppt (Fig. 17) while bottom salinities ranged from 31.25-33.54 ppt (Fig. 18). Salinities were highest in Dixon Entrance and southern Hecate Strait and lowest on Dogfish Bank. Both surface and bottom temperatures were lower in 1996 than in 1995 (Workman *et al.* 1996). This corresponds with a reduction in the El Nino event for 1995.

ACKNOWLEDGMENTS

The Canadian Groundfish Research and Conservation Society provided funding for the charter vessel during the survey and we are grateful for this assistance. We would also like to acknowledge the assistance of Captain Suraj Gulati, fishing master Brian West and the crew of the F/V W.E. RICKER and Captain Kelvin Mark and the crew of the F/V STEADFAST. Archipelago Marine Research provided personnel (Marcus Bell and Jerry Clopper) for sampling and catch processing aboard the F/V STEADFAST. Brenda Waddel thoroughly reviewed the manuscript, providing valuable editorial input.

Appendix Table 1. Criteria used for determining stage of maturity of sole sampled during the R/V W.E. RICKER trawl survey of Heacte Strait, May 30 - June 13, 1996.

Maturity stage	Code	Testes	Ovaries
Immature	1	Testes very small, string-like and somewhat translucent or pinkish in colour.	Ovaries very small, translucent or pinkish in colour and somewhat gelatinous in texture.
Immature	2	Testes enlarged, a distinct bulge evident but still translucent or pinkish in colour.	Ovaries relatively small, pinkish-yellow or cream in colour, granular in texture. No distinct eggs visible.
Developing	3	Testes enlarged, brown-white or white in colour, firm in texture.	Ovaries large, cream or yellow in colour, containing opaque eggs that can be distinguished by direct observation. Sex may be determined externally.
Ripe	4	Testes large, white and easily broken. No sperm evident.	Ovaries containing partly or wholly translucent eggs. Sex easily determined externally.
Spawning	5	Testes large, white and sperm evident.	Ovaries containing entirely translucent, mature ova. Eggs loose and will run from oviducts under slight pressure.
Spent	6	Testes flaccid, shrunken and yellow-brown in colour. Sperm ducts enlarged and a small amount of sperm may be present.	Ovaries large, flaccid and purple in colour; a few translucent eggs may be left. Ovarian membrane very bloodshot and sac-like.
Resting	7	Testes firm, small and yellow-brown in colour. Sperm ducts small.	Ovaries contracted and firm, pinkish-grey to cream-yellow in colour and may appear granular in texture but no distinct eggs are visible.
