## **Canadian Data Report of Fisheries and Aquatic Sciences**

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

Data Reports are not intended for general distribution and the contents must not be referred to in other publications without prior written clearance from the issuing establishment. The correct citation appears above the abstract of each report.

## **Rapport statistique canadien des sciences halieutiques et aquatiques**

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Les Rapports statistiques ne sont pas préparés pour une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au haut du résumé de chaque rapport.

## ABSTRACT

Schofield, E.J. and J.L. Peppar. 1979. Densities of freshwater fishes(non-Atlantic salmon), Miramichi River system, New Brunswick, 1970-78. Can. Data Rep. Fish. Aquat. Sci. No. 170. 52 p.

Electroseining operations were conducted throughout the freshwater reaches of the Miramichi River system, New Brunswick, to determine population densities of the fish species present. Though the main emphasis of these operations was placed on deriving juvenile Atlantic salmon population estimates, data were also collected on the other species present. This report presents the calculated densities obtained from these operations over the period 1970-78, for all species other than Atlantic salmon, and includes data on areas sampled, average depths and water temperatures of the individual sites sampled.

**Key words:** Miramichi River, electroseining, population density, non-salmon species, area sampled, water depth, water temperature.

## RÉSUMÉ

Schofield, E.J. and J.L. Peppar. 1979. Densities of freshwater fishes(non-Atlantic salmon), Miramichi River system, New Brunswick, 1970-78. Can. Data Rep. Fish. Aquat. Sci. No. 170. 52 p.

Des opérations d'électroseinnage ont été menées dans les affluents d'eau douce du réseau de la rivière Miramichi, au Nouveau-Brunswick, afin de déterminer la densité de population des espèces de poissons présentes. Bien que le principal objectif du programme consistât à évaluer la densité de population du jeune saumon atlantique, ces activités ont également rendu possible la collecte de données sur d'autres espèces. Le présent rapport contient le calcul des densités pour tous les poissons autres que le saumon atlantique, obtenues à l'aide des échantillonnages effectués de 1970 à 1978, ainsi que les données sur les zones échantillonées et la profondeur moyenne et la température de l'eau des lieux étudiés.

**Mots clés:** Rivièrre Miramichi, électroseinnage, densité de population, espèces autres que le saumon, zone échantillonnée, profondeur de l'eau, température de l'eau.

## INTRODUCTION

Electroseining operations to determine population densities of fish species present were conducted yearly throughout the freshwater reaches of the Miramichi River system, New Brunswick, over the period 1969-78. Operations each year concentrated on the repetition of sites sampled in previous years, so that consecutive-year comparisons could be drawn. The main emphasis of these operations was placed on deriving juvenile Atlantic salmon population estimates; however, data were also collected on the other species present.

Calculated densities (numbers/83.6 m<sup>2</sup> or 100 yd<sup>2</sup>) of juvenile Atlantic salmon for all sites sampled (1969-77) by the electroseining operations have been presented (Peppar and Schofield 1978). This report summarizes calculated densities obtained for all other fish species captured from these operations, over the period 1970-78. Miscellaneous data (areas sampled, average depths and water temperatures) collected during the operations are also presented.

## SCOPE OF OPERATIONS

The electroseining operations were conducted on a number of selected streams throughout the Miramichi River system (Figure). Most of the streams studied were inaccessible for much of their length; thus, sampling sites had to be selected in areas of reasonable access by standard vehicle.

## METHODS AND PRESENTATION OF DATA

All methods employed in the actual electroseining operations and used in deriving the population estimates have been presented (Peppar and Schofield 1978). Miscellaneous data collected from the operations and summarized in the tables to follow include: areas of sites sampled (total enclosed area per site sampled), average depths of sites (average depth of each site, based on a minimum of usually nine measurements per site) and water temperatures of sites (taken within each site, just prior to the seining operations). These data are summarized for all individual sites by year, over the nine years of sampling.

The calculated densities of all species obtained for the individual sites sampled each year are summarized. These species include:

Designation in table	Common name	Scientific name
Lamprey	Sea lamprey	<i>Petromyzon marinus</i>
Eel	American eel	<i>Anguilla rostrata</i>
Trout	Brook trout	<i>Salvelinus fontinalis</i>
Dace	Blacknose dace	<i>Rhinichthys atratulus</i>
Chub	Lake chub	<i>Cyprinus plumbeus</i>
	Creek chub	<i>Semotilus atromaculatus</i>
Shiner	Common shiner	<i>Notropis cornutus</i>
Sucker	White sucker	<i>Catostomus commersoni</i>
Stickleback	Threespine stickleback	<i>Gasterosteus aculeatus</i>
	Brook stickle- back	<i>Culaea inconstans</i>
	Ninespine stickleback	<i>Pungitius pungitius</i>
Sculpin	Slimy sculpin	<i>Cottus cognatus</i>

The preceding list includes the species or "species-groups", other than Atlantic salmon, most often represented in the electroseining catches. Species names represent the most commonly-captured (or in some cases, exclusively captured) representatives of each of these species or "species-groups". Common and scientific names given are those recommended by the American Fisheries Society (1970).

## RESULTS

The streams and corresponding numbers of sites where electroseining operations were conducted are summarized (Table 1). The table indicates the location of each stream by specific area within the system (Main Miramichi-streams flowing into Miramichi Bay or estuary; Northwest Miramichi-streams flowing into the Northwest Miramichi River; and Southwest Miramichi-streams flowing into the Southwest Miramichi River), and presents the total area sampled and numbers of each species or "species group" captured each year.

Calculated densities of species obtained for each stream and individual site sampled are presented (Tables 2-28). The overall mean densities for each species and for the Miramichi River system for each year of sampling are also presented (Table 29). Miscellaneous data are summarized for each site and year (Tables 30-56).

#### ACKNOWLEDGEMENTS

The authors are pleased to express their gratitude to P.R. Pickard, Biological Technician, who was responsible for the supervision of field staff and the collection and compilation/analyses of data during several years of these investigations, and to R.S. Blair (term employee) and J. Singer (seasonal employee), who assisted in the data compilations.
