Canadian Data Report of Fisheries and Aquatic Sciences

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

Data Reports are not intended for general distribution and the contents must not be referred to in other publications without prior written clearance from the issuing establishment. The correct citation appears above the abstract of each report.

Rapport statistique canadien des sciences halieutiques et aquatiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Les Rapports statistiques ne sont pas préparés pour une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au haut du résumé de chaque rapport.

ABSTRACT

Chilton, D. E., M. Stocker, and J. Fargo. 1979. Length and age composition of rock sole (Lepidopsetta bilineata) from commercial landings from the Butterworth-Warrior area of Hecate Strait, 1973-78. Can. Data Rep. Fish. Aquat. Sci. 177: 17 p.

Length and age composition data are summarized from commercial landing samples of rock sole for the years 1973-78 from northern Hecate Strait. Tables provide summaries of length and age composition by sex based on a number of samples collected throughout each fishing season.

RÉSUMÉ

Chilton, D. E., M. Stocker, and J. Fargo. 1979. Length and age composition of rock sole (Lepidopsetta bilineata) from commercial landings from the Butterworth-Warrior area of Hecate Strait, 1973-78. Can. Data Rep. Fish. Aquat. Sci. 177: 17 p.

Le rapport présente sous forme résumée des données sur la longueur et la répartition par âge d'échantillons de débarquements commerciaux de sole du Pacifique provenant du nord du détroit d'Hécate, couvrant la période 1973-1978. Des tableaux résument les données sur la longueur et la répartition par âge selon le sexe, à partir d'un certain nombre d'échantillons recueillis au cours de chaque saison de pêche.

INTRODUCTION

Sampling of commercial landings of rock sole (Lepidopsetta bilineata) has been carried on since 1944 by Fisheries personnel of the Canadian Government. The most important stock of rock sole on the coast of British Columbia inhabits northern Hecate Strait (Fig. 1). The stock is fished almost exclusively by Canadian vessels during the months of May to October, and for many years has been the principal source of rock sole landings in the province.

Rock sole landed in British Columbia are sampled for length, sex, and age (from otoliths). The sampling is conducted on randomly selected frames or carcasses (occasionally, round fish) from plant fillet lines and is continued, while fish are available, until three consecutive centimeter intervals in the length frequency contain 20 fish each, or one centimeter interval contains 30 fish. All fish are measured to the nearest centimeter.

The present report summarizes the size and age composition of commercial landings of rock sole landed from the Butterworth-Warrior region of northern Hecate Strait during the period 1973-78. No samples were collected from the 1972 rock sole fishery in northern Hecate Strait. Rock sole age composition data covering the years 1945-63 and 1964-71 from this area have been reported previously (Forrester 1966; Chilton and Smith 1972). Age composition for rock sole in Queen Charlotte Sound (Area 5A) has been summarized for the years 1959-69 (Chilton and Smith 1971).

The ages of rock sole are determined by interpreting the surface annuli of whole otoliths. Recently, sectioning of older or more difficult otoliths has been established on a routine basis in this laboratory as an age check and as a means of determining an age of a fish when the surface of the whole otolith has become opaque.

Comparisons of ages are being made between the surface and the sections of otoliths. The preliminary results indicate that ages determined from sections may be older for the older fish in some cases. In one instance, the surface was aged as 13 years and the section aged 17 years. This was a 51 cm female caught in July 1977 in the Butterworth Rocks area (5D). Previously the oldest recorded age for a female was a 16-year-old, 43 cm fish from Bristol Bay Alaska (Forrester 1969).

It will be noted that in 1973 there was a strong influx of 3-year-old fish into the Butterworth-Warrior fishery with a average length of 32.8 cm and 31.7 cm for females and males, respectively. This phenomenon has not been noticed since the mid-1940s.

The accompanying tables provide, for each year, a summary of length and age composition by sex, based on a number of samples collected throughout the fishing season. On the right-hand side of each table, the seasonal length frequency is expressed in numbers and percentage of individuals in each centimeter (cm) length group. The average length and average age in the sample as a whole appears just below the table heading.

Across the bottom of each table the number (NO) and percentage (PC) of individuals in each age group, the average length of fish at each age (AC), and its standard deviation (SD) are given.

The information provided in this data report is used for assessing the rock sole fishery in northern Hecate Strait by employing sequential population analysis. This technique enables estimation of population at age, instantaneous rates of fishing mortalities, and recruitment.
