## ABSTRACT

DeBruyn, E. R., J. A. Shearer, and D. L. Findlay. 1982. Phytoplankton primary production, chlorophyll, biomass and suspended carbon in the Experimental Lakes Area - 1981 data. Can. Data Rep. Fish. Aquat. Sci. 336: iv + 72 p.

Incubator measurements of photosynthetic carbon uptake by phytoplankton were conducted for twelve lake basins in the Experimental Lakes Area. Chlorophyll and suspended carbon were also measured for these lake basins. Algal cell counts converted to biomass are given for basins studied. The methodology is briefly described with the resultant data tabulated or graphically presented.

Key words: Primary production; photosynthesis; phytoplankton; experimental data; incubation; biomass; chlorophyll; suspended matter.

## RESUME

DeBruyn, E. R., J. A. Shearer, and D. L. Findlay. 1982. Phytoplankton primary production, chlorophyll, biomass and suspended carbon in the Experimental Lakes Area - 1981 data. Can. Data Rep. Fish. Aquat. Sci. 336: iv + 72 p.

On a effectué l'analyse en incubateur du phytoplancton des douze lacs de la Région des Lacs Expérimentaux pour en mesurer l'absorption de carbone photosynthétique. On a également mesuré la teneur en chlorophylle et en carbone en suspension de ces lacs. Le nombre de cellules des algues transformées en biomasse est indiqué pour chacun des lacs analysés. Les résultats apparaissent sous forme de tableaux ou de graphiques suivant une courte description de la méthodologie utilisée.

Mots-clés: photosynthèse; phytoplancton; résultats expérimentaux; incubation; matières en suspension.

## INTRODUCTION

Using the incubator technique described in previous reports of this series (DeBruyn and Shearer 1981; DeClercq and Shearer 1976, 1978, 1979 and 1980; DeClercq et al. 1977; Shearer 1976; Shearer and Fee 1974), phytoplankton primary production was routinely measured in twelve lake basins in the Experimental Lakes Area (ELA) in 1981. Phytoplankton biomass, chlorophyll and suspended carbon were also measured.

This report is a continuation and revision of the incubator technique methodology previously described by DeBruyn and Shearer (1981) and DeClercq and Shearer (1980). The 1981 data are presented here in either graphic or tabular form for the following parameters: irradiance versus carbon uptake, biomass, chlorophyll and suspended carbon.

## FIELD PROCEDURES

This primary production study was conducted for lake basins 114, 222, 223, 224, 226NE, 226SW, 227, 239, 302N, 302S, 661 and 979 during the ice free season. These basins are located in the Experimental Lakes Area (ELA), northwestern Ontario (see Johnson and Vallentyne 1971).

Lake basins 114 and 223 were still undergoing a controlled program of acidification with  $H_2SO_4$  in 1981 (Schindler, Wagemann et al. 1980). Lake 227 was in its thirteenth year of nutrient addition while basins 226NE and 226SW were in their first full recovery year after eight years of nutrient additions (Schindler 1975; Schindler and Fee 1974). The reinforced plastic "sea curtain" was maintained between the NE and SW basins of Lake 226. Lake 302N was in its third year of recovery following six years of hypolimnetic nutrient additions (Schindler, Ruszcynski and Fee 1980). The "sea curtain" which separated the north and south basin was removed in the spring of 1980 and then replaced by a new "curtain" in the spring of 1981.

With the exception of Lakes 661 and 979, lake basins were sampled in a manner similar to that described by DeClercq and Shearer (1978). An integrating sampler (Shearer 1978) was used to collect 4.5 litres of epilimnion, metalimnion or hypolimnion water from the euphotic zone of each basin at 2 week intervals throughout the field season. Concurrent light attenuation measurements (Shearer and DeBruyn 1982) were used for determining euphotic zone depth and calculation of integral production rates (Fee 1977). Because of their shallow depth, less than 1 meter maximum, the two bog lakes, 661 and 979, were sampled using a dip method. Samples were returned to the laboratory as quickly as possible in insulated containers.

## LABORATORY PROCEDURES

With only minor variations, the methodology described by DeBruyn and Shearer (1981) and DeClercq and Shearer (1980) for processing field

samples was continued through 1981. Subsamples were retained, prior to incubation, for dissolved inorganic carbon (DIC), chlorophyll and suspended carbon analyses. Subsamples preserved with Lugol's solution were taken for algal cell counts, species identification and biomass calculations (Findlay and Saesura 1980).

A gas stripping technique, using an infrared gas analyser (Lira model 202) coupled to a variable span strip chart recorder, was used to determine DIC concentrations throughout the entire sampling season.

Using a repeating injection system, 0.80 mL of 12  $\mu\text{Ci mL}^{-1}$   $\text{Na}_2^{14}\text{CO}_3$  stock solution was injected into each 125 mL bottle to be incubated. Because of the variable nature of the stock "label" solution, the radioactivity was standardized each day by direct measurement as described by DeClercq and Shearer (1980).

The acidification and bubbling method (Schindler et al. 1972) was changed from bubbling incubated sample aliquots in ALLIHN tubes to bubbling in aliquots within the scintillation vials enclosed in a specially designed vacuum chamber (Wessels and Birnbaum 1979). After acidification and bubbling, PCS (Amersham/Searle) scintillation cocktail was added to each vial and all vials counted for radioactivity with a Beckman LS8000 counter.

Scalar quantum irradiance in each of the four incubation chambers was measured with either a LI-COR, model LI-193S spherical sensor or a Biospherical Instruments QSL 100 or QSL 200 spherical sensor. Light values reported through mid-June in this report are those obtained with the LI-COR sensor. Subsequent light values were obtained with the QSL sensors.

## PRESENTATION OF DATA

Appendix 1 of this report contains the physical, chemical and biological parameters collected in this study.

Appendix 2 of this report graphically presents production versus irradiance data obtained from the incubator experiments.

## ACKNOWLEDGMENTS

We wish to express our appreciation to G. Linsey, S. Prychitko, A. Turner and B. Hauser for their assistance in processing the DIC, suspended carbon and chlorophyll samples. A special note of appreciation to S. A. Meron for her assistance in processing incubator samples and data from May through August.

## APPENDIX I

Data relevant to each sampling time are listed chronologically according to lake basin.

Depths are reported in meters.

The date stated is that of sample collection and incubation. The time of actual field collection is reported as Central Daylight time from 26 April through 24 October after which it is Central Standard time.

Temperature, in degrees Centigrade, is the temperature at which the incubation was carried out. Dissolved inorganic carbon (DIC) analysis was done on pre-incubated water samples. Reported units are micromoles litre<sup>-1</sup>. Values for suspended carbon and chlorophyll are in micrograms litre<sup>-1</sup>.

I1 through I4 are incubator irradiances in microeinsteins meter<sup>-2</sup> sec<sup>-1</sup>.

P1 through P4 are rates of inorganic carbon uptake at the four separate incubator irradiances in units of milligrams carbon meter<sup>-3</sup> hour<sup>-1</sup>. The two values given at each irradiance are those of replicate samples. The coefficient of variation (C.V.) for replicates is given.

Live biomass is calculated from algal cell counts and approximated cell volumes of the species encountered in the sample. Values are reported in grams meter<sup>-3</sup>.

## NOTES:

- \* Production values are unusually erratic or differ from expected results and should be considered only with caution.
- \*\* Missing values are denoted with -10.00. The sample may have been lost during the incubation process.

## APPENDIX 2

Plots of photosynthetic carbon uptake versus incubator irradiance are arranged chronologically according to lake basin. Irradiance is plotted on a logarithmic scale, production on a linear scale. The vertical bars of the plot join the replicate bottle values for each irradiance.

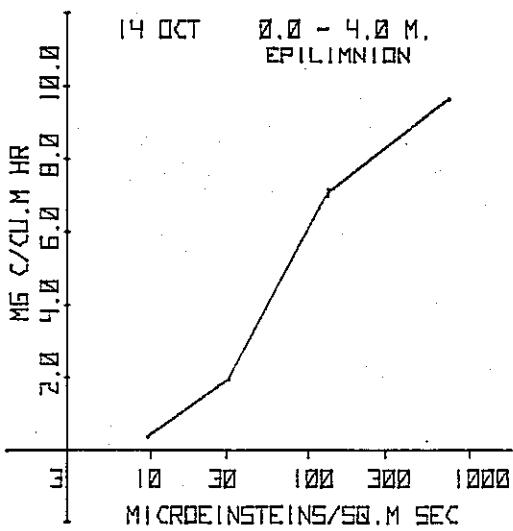

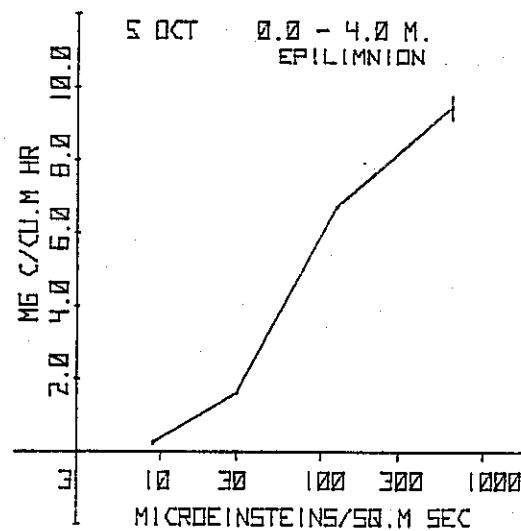

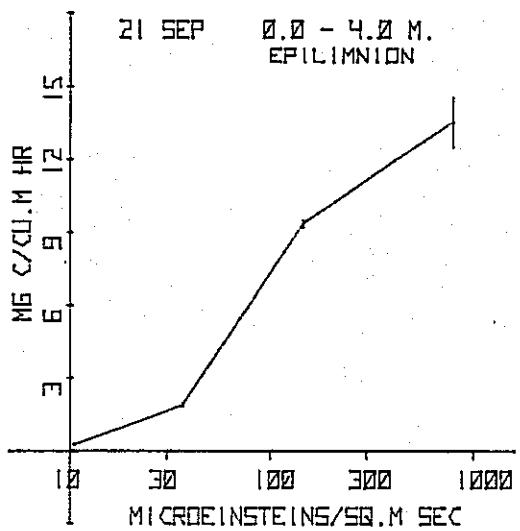

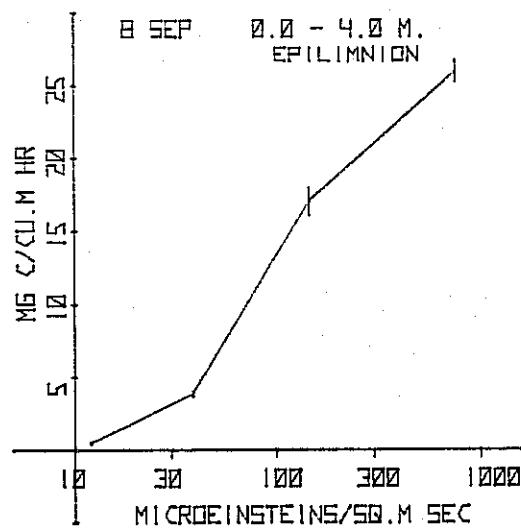

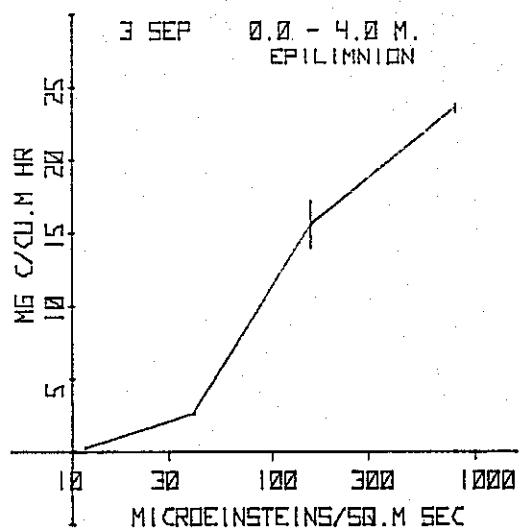

The date, depth and thermal zone are indicated on each plot.
