Canadian Data Report of Fisheries and Aquatic Sciences

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

The correct citation appears above the abstract of each report.

Rapport statistique canadien des sciences halieutiques et aquatiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Le titre exact paraît au haut du résumé de chaque rapport.

ABSTRACT

Shearer, J.A., and E.R. DeBruyn. 1983. Light attenuation in the Experimental Lakes Area - 1982 data. Can. Data Rep. Fish. Aquat. Sci. 411: iv + 63 p.

Depth profiles of photosynthetically active radiation were measured periodically in nineteen lake basins of the Experimental Lakes Area during the ice-free season of 1982. These data are tabulated and plots of irradiance versus depth are presented. Mean attenuation coefficients have been calculated from the data.

Key words: light penetration, water transparency, limnological data.

RESUME

Shearer, J.A., and E.R. DeBruyn. 1983. Light attenuation in the Experimental Lakes Area - 1982 data. Can. Data Rep. Fish. Aquat. Sci. 411: iv + 63 p.

Nous avons mesuré périodiquement, au cours de la saison sans glace de l'année 1982, les profils de profondeur de la radiation photosynthétique dans dix-neuf bassins des lacs situées dans la Région des Lacs Expérimentaux. Nous avons établi des tables de ces données et nous avons figuré graphiquement les émissions de radiations face à la profondeur. A partir de ces données, nous avons calculé les coefficients moyens d'atténuation.

Mots-clés: pénétration de la lumière; transparence de l'eau; données limnologiques.

INTRODUCTION

This report presents irradiance versus depth data collected during 1982 for selected basins within the Experimental Lakes Area (ELA), northwestern Ontario (Johnson and Vallentyne 1971). These data were collected in conjunction with phytoplankton productivity studies (DeBruyn et al. 1983). The measured irradiances represent the quantum flux density in the 400-700 nm waveband and can be defined as photosynthetically active radiation (PAR).

The content and format of this report are similar to those found in the eight previous volumes of this annual series (Shearer 1976; Shearer and DeClercq 1976, 1977, 1978, 1979, 1980; Shearer and DeBruyn 1981, 1982). A brief description of methodology is provided and the attenuation data are presented both in tables and graphs.

DATA COLLECTION AND ANALYSIS

The vertical attenuation of PAR was monitored in nineteen lake basins during the ice-free season of 1982. These basins range in surface area from 1.3 to 56 hectares and in maximum depth from 0.8 to 33 meters.

Eight of these basins (114, 223, 226NE, 226SW, 227, 239, 302N, 302S) were surveyed at intervals of approximately two weeks, weather permitting. Most of the remaining basins (222, 224, 303, 304, 305, 382, 382 Bay, 661) were surveyed monthly. Lakes 93, 111 and 629 were surveyed on only a few occasions because of poor accessibility.

The separate basins of lakes 226, 302 and 382 are all maintained by means of reinforced plastic "sea curtains".

Lakes 114, 223, 302N and 302S were all undergoing some scheme of artificial acidification during 1982 (Schindler et al. 1980; Schindler and Turner 1982). Lake 227 was being fertilized with nitrogen and phosphorus (Schindler et al. 1971; Schindler 1975).

All profiling was carried out using a Li-Cor LI-192S cosine-response underwater quantum sensor and LI-185 meter. The sensor was suspended pointing vertically upward and lowered through the water column in this orientation.

Surface readings were taken in air above the surface and corrected for the sensor immersion factor. Care was taken to avoid either shading or reflections from the boat. Underwater readings were taken at 0.5 meter depth (sometimes also at 0.25 m) and then at 1 meter intervals from 1.0 meter depth until the underwater reading had dropped to less than 0.5% of the corrected surface value (or until bottom was reached).

Whenever possible, profiling was done under clear skies or under uniform overcast. When skies were clear, profiles were usually taken at intermediate solar angles (see Combs 1977). Calm conditions were also preferred.

The profiles included in this report are presented in two forms. Appendix 1 lists the measured values of irradiance versus depth. The underwater irradiance values have been converted to percentages of the coincident surface irradiance. Appendix 2 presents plots of these data along with fitted slopes calculated from the data. In both appendices the data are grouped by lake basin and listed chronologically.

APPENDIX 1

This appendix lists the data for vertical light attenuation profiles taken at the ELA during 1982.

All times are local, i.e. Central Daylight Time (CDT).

Each attenuation coefficient is the negative slope of a linear regression of the natural logarithm of the percent surface irradiance on depth. R^{**2} (or r^2) is a measure of the goodness of fit of the above regression, wherein 1.00 would represent a perfect fit.

The depths are in meters. Irradiance values are actual, rather than fitted, and are given as percentages of the surface value (corrected for immersion effect).

APPENDIX 2

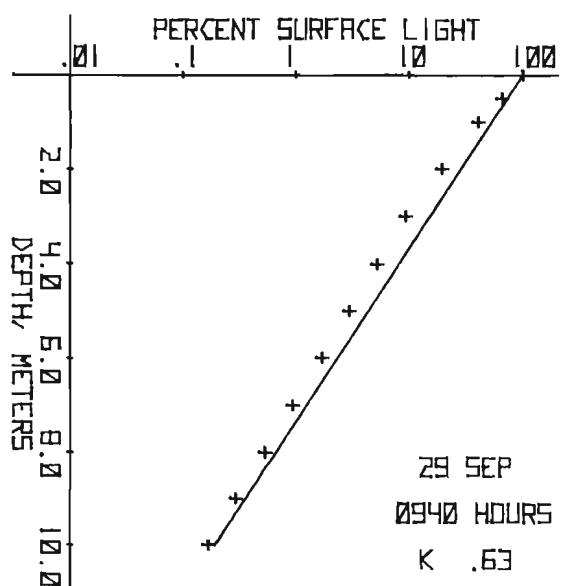

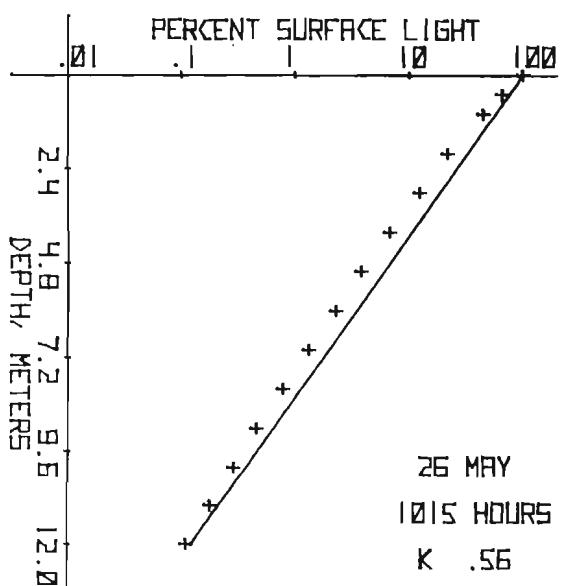

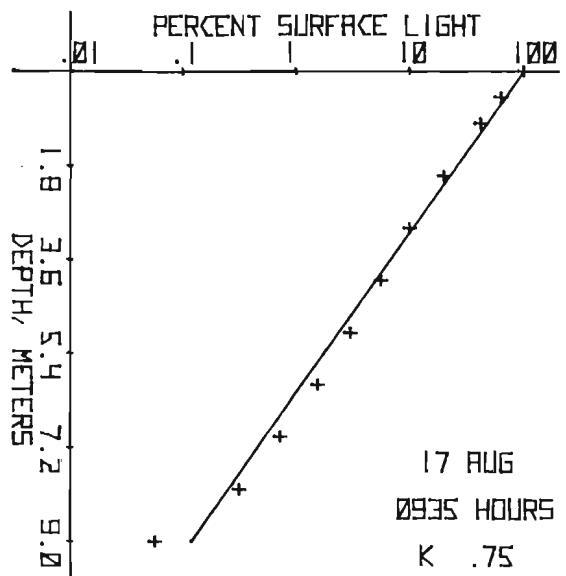

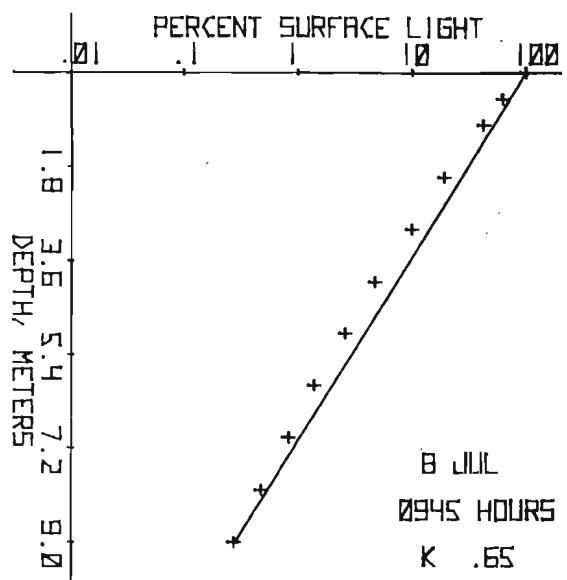

In this appendix, the measured irradiances (as percentages of surface irradiance) are plotted against depth (in meters). Percent surface light is plotted on a logarithmic scale, depth on a linear scale.

Each attenuation coefficient (K) is the negative slope of a regression of the natural logarithm of the percent surface light on depth. The solid line represents this regression and is an estimate of the percent surface light at depth, based on K . It has been drawn through 100% at 0 depth because this irradiance-depth relationship is fixed by definition.
