Canadian Data Report of Fisheries and Aquatic Sciences

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

The correct citation appears above the abstract of each report.

Rapport statistique canadien des sciences halieutiques et aquatiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Le titre exact paraît au haut du résumé de chaque rapport.

ABSTRACT

Rankin, D. P., H. J. Ashton, and O. D. Kennedy 1983. Zooplankton abundance in British Columbia lakes sampled by the Lake Enrichment Program in 1977. Can. Data Rep. Fish. Aquat. Sci. 421: iv + 254 p.

Zooplankton samples were collected in 1977 from 43 lakes on Vancouver Island, the Queen Charlotte Islands, and mainland British Columbia. Samples were also collected from 2 lakes (Kluksu and Neskataheen) in the Yukon Territory. The purpose of the sampling was to collect data on zooplankton abundance and species composition from fertilized lakes and lakes being considered for fertilization by the federal-provincial Salmonid Enhancement Program. Forty-three lakes contained anadromous sockeye salmon (Oncorhynchus nerka); one lake (Mohun) contained kokanee. Zooplankton biomass ranged from a low of 1.2 mg/m³ (dry) to a high of 270. mg/m⁻³ (dry) in Neskataheen.

Key words: zooplankton, sockeye, lake enrichment, British Columbia, Yukon Territory, Salmonid Enhancement Program

RÉSUMÉ

Rankin, D. P., H. J. Ashton, and O. D. Kennedy 1983. Zooplankton abundance in British Columbia lakes sampled by the Lake Enrichment Program in 1977. Can. Data Rep. Fish. Aquat. Sci. 421: iv + 254 p.

Des échantillons de zooplancton ont été recueillis en 1977 dans 43 lacs de l'île Vancouver, de l'archipel de la Reine-Charlotte et du territoire continental de la Colombie-Britannique. Des échantillons ont également été recueillis dans deux lacs (Kluksu et Neskataheen) du Yukon. L'échantillonnage avait pour but de rassembler des données sur les quantités et la composition des espèces de zooplancton dans des lacs fertilisés ou que l'on envisage de fertiliser aux termes du Programme fédéral-provincial de mise en valeur des salmonidés. Quarante-trois lacs contenaient du saumon sockeye anadrome (Oncorhynchus nerka), et un lac (Mohun) du kokani. La biomasse de zooplancton dans le lac Neskataheen variait d'un minimum de 1,2 mg/m³ (poids sec) jusqu'à 270 mg/m³ (poids sec).

Mots-clés: zooplancton, sockeye, engrangement d'un lac, Colombie-Britannique, Territoire du Yukon, Programme de mise en valeur des salmonidés.

INTRODUCTION

Samples of zooplankton have been collected from a variety of lakes in British Columbia in each year since 1977 and from lakes in the Yukon in 1977 only (see previous reports by Stockner and Shortreed 1978a,b; Rankin, Ashton and Kennedy 1979; and Rankin and Ashton 1980). These samples have been collected as part of the Lake Enrichment Program's studies on the use of nutrient additions to oligotrophic lakes as an enhancement technique for sockeye salmon (Stockner 1977 reviewed the objectives and progress of lake enrichment in the Pacific Northwest). The general purpose of these sampling efforts is to provide data concerning zooplankton abundance, species and size composition in a wide range of sockeye salmon nursery lakes. Information on zooplankton is used to assess, in part, a given lake's suitability for treatment to increase zooplankton food supplies potentially available to juvenile sockeye. During years in which the lake is treated these same data are required as indicators of treatment effects and their potential impact on sockeye growth and survival.

Although some of the data to be presented here have been reported in summary form by Rankin et al. (1979) and Stockner and Shortreed (1978a), a complete record of the methods and results associated with the analysis of the 1977 zooplankton samples has not been produced to date and this is the focus for the present report.

METHODS AND MATERIALS

The locations of the lakes are given in Appendix table 1. During 1977, only Great Central, Henderson, Hobiton, Long and Mohun Lakes were fertilized. The locations of sampling sites in the treated lakes and Kennedy Lake were given by Stockner, Shortreed and Stephens (1980). Sampling site locations for other lakes (Awun, Babine, Eden, Ian, Kitlope, Mercer and Morice Lakes) were published by Costella et al. (1982). In the lakes not mentioned, stations were always located in mid-lake.

Zooplankton vertical hauls were taken using a dark, 100- μm SCOR¹ net (mouth area = 0.25 m²). The depths from which the hauls were taken are given in the summary tables in Section 1. The net was rinsed and the sample removed and preserved in a 4% formalin-sucrose solution. The filtration coefficient of the net was assumed to be 1.0.

In the laboratory the sample was halved. Half of the sample was made up to 300 mL in a round-bottom flask. The contents of the flask were mixed thoroughly after which an aliquot was extracted using a bulb pipette. The size of the aliquot varied depending on the number of zooplankters in the

¹Scientific Committee on Ocean Research.

sample. In dense samples (e.g. those from northern lakes) 1/150 of the sample was usually processed; in sparse samples (e.g. those from Vancouver Island lakes) usually 1/20 or 1/10 of the sample was processed. The species were identified, staged and counted under low magnification (24x or 50x). Species identifications were made using the taxonomic keys in Edmondson (1959) and Pennak (1978) and should be considered tentative. Cladocera and copepods were categorized according to the size classes in LeBrasseur and Kennedy (1972). The remainder of the sample was scanned for rare species, i.e. species that did not appear in the aliquot.

The other one-half of the sample was filtered onto a 0.45- μm Millipore filter and dried for 24 hours. No effort was made to remove large, rare animals (e.g. chironomid larvae, mysids) that may have added to the weight. The detrital content (e.g. debris, diatom contamination, etc.) of each sample was estimated in a semi-quantitative fashion from 0 or no contamination to 4 or heavy contamination. If the detritus content was above 2, the dry biomass estimates should be treated with caution. Total wet weights were calculated using the species counts, the median length for each size group, and length-wet weight relationships given in Appendix table 2. Where the detritus content was high the calculated weights (reported in the summary tables) are considered more representative of the zooplankton biomass.

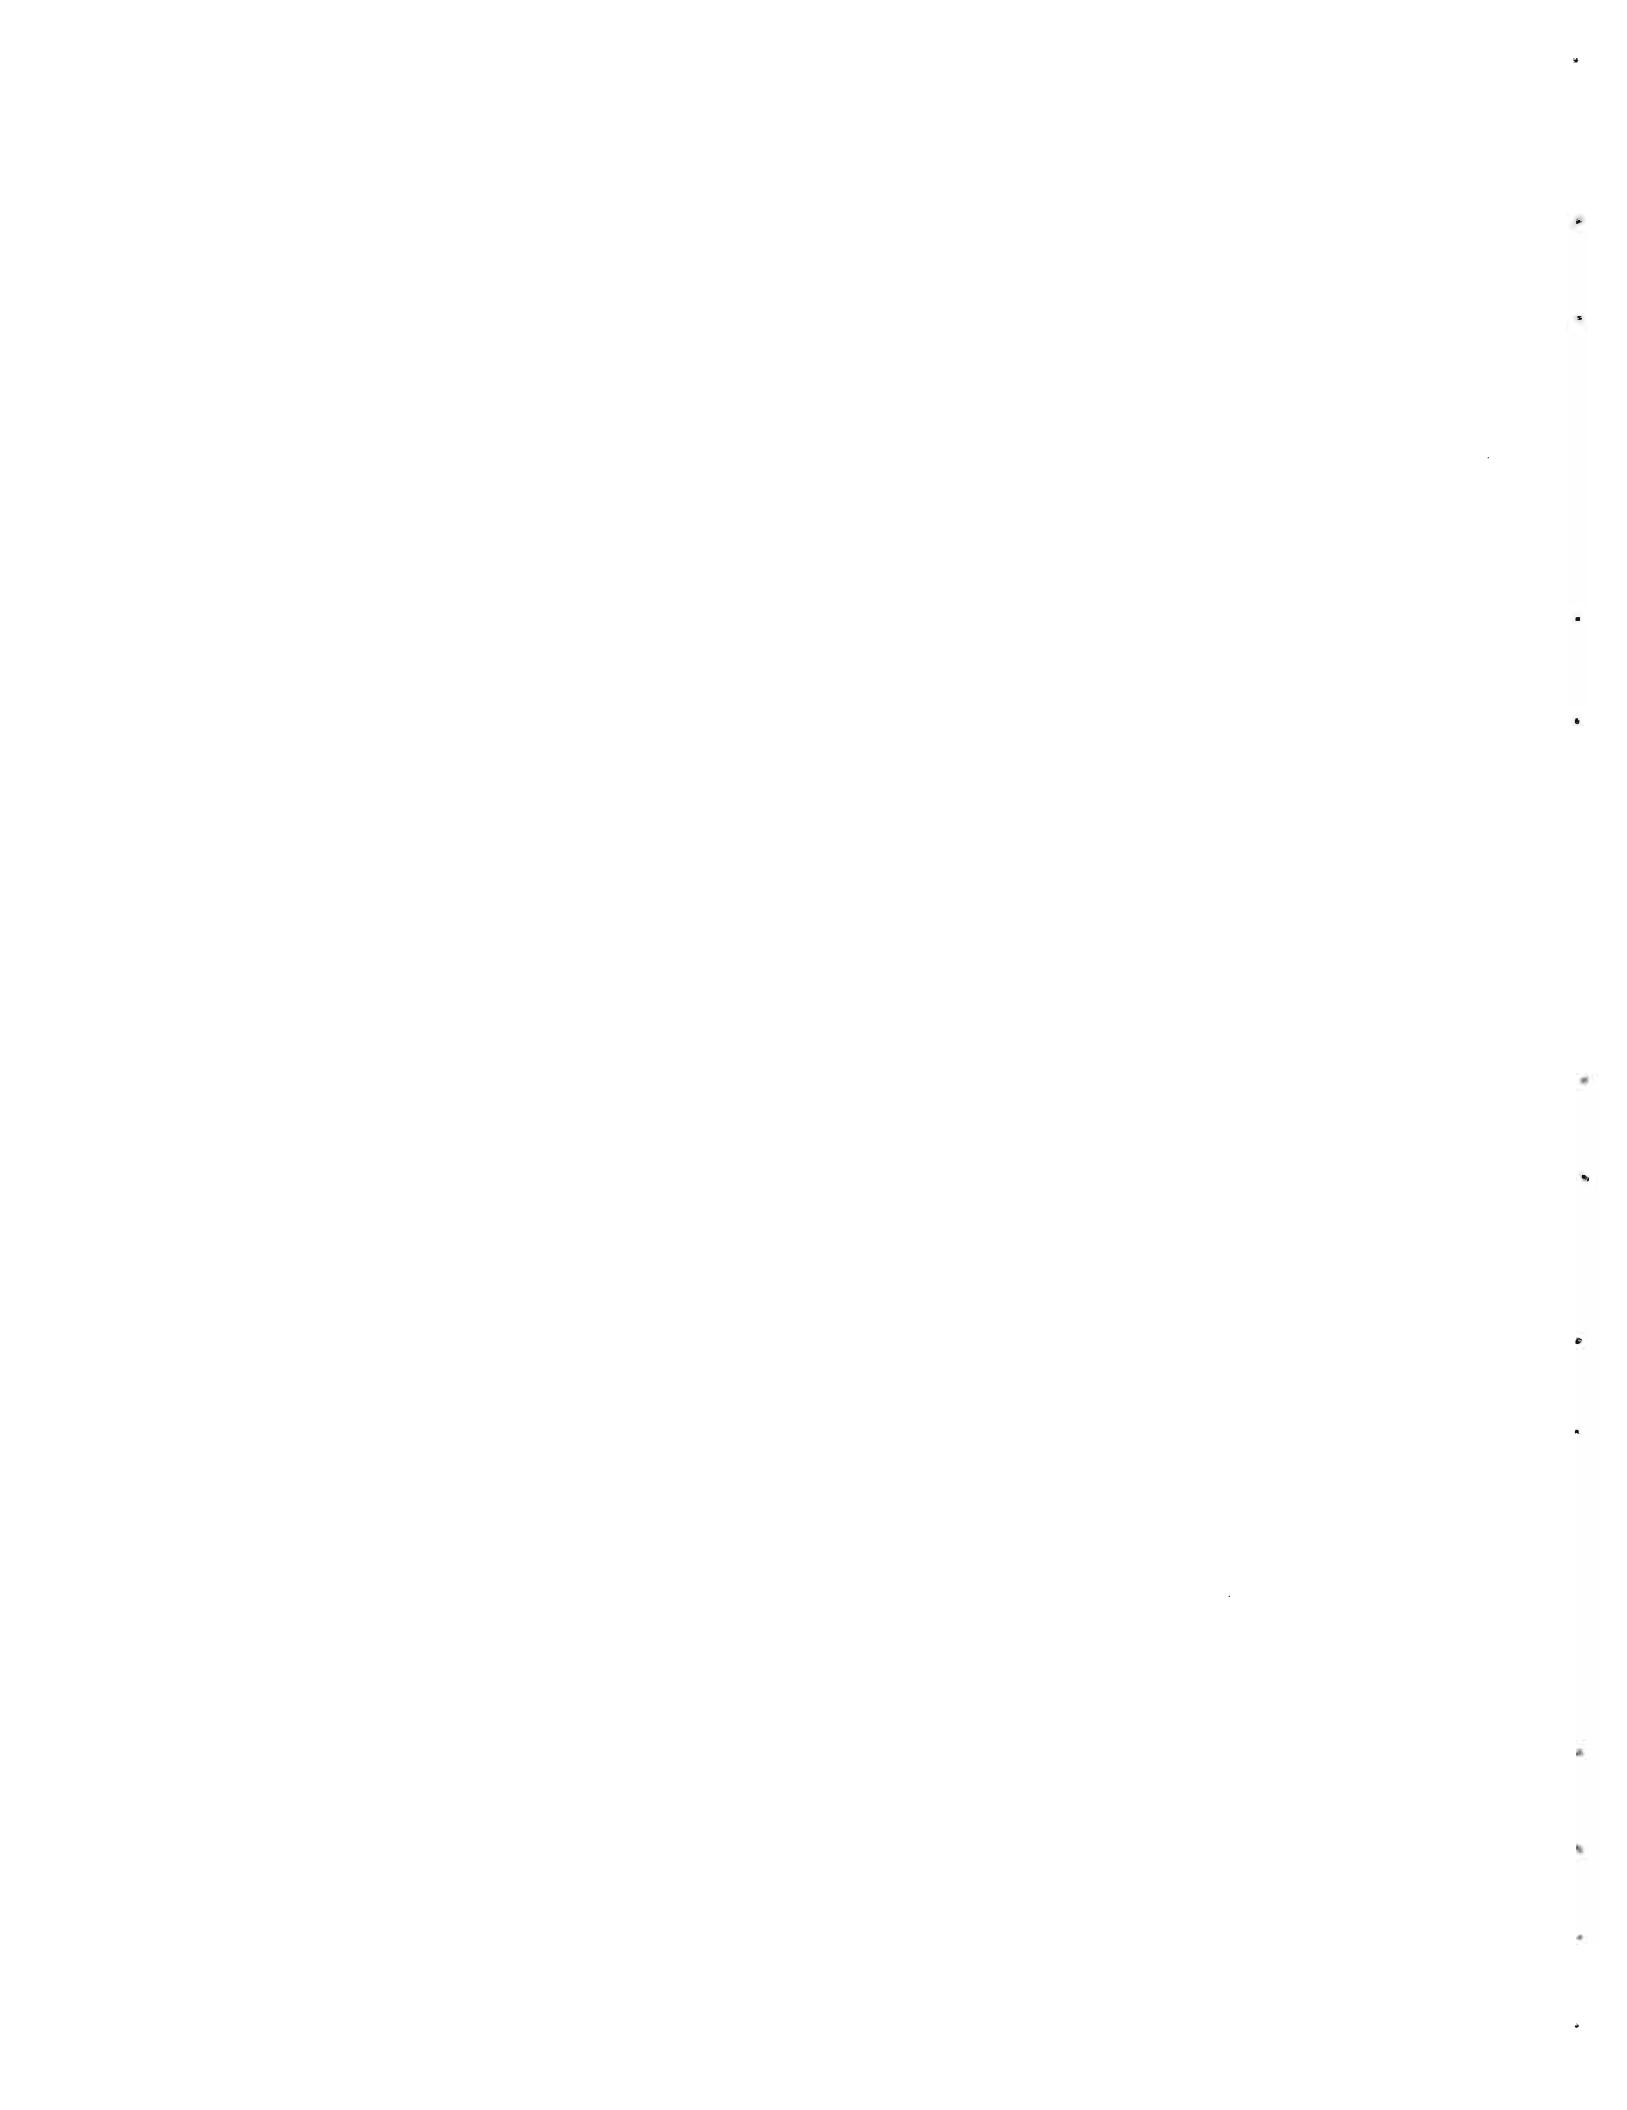

The data are presented in three sections. The first section contains summarized data for quick reference. The second section contains the zooplankton species counts, recorded on each sampling day, grouped as closely as possible into common size classes. This section was derived from Section 3 and was designed to be compatible with data tables produced by the current zooplankton processing system (Cone et al. 1983). Since 1977, four different methods have been used to process the zooplankton samples. The present system (described by Cone et al. 1983) was in place by 1981. It consists primarily of a television monitor and camera connected to a dissecting scope. A set of electronic calipers and a key pad, interfaced with an Apple II computer, are used to record zooplankton length and species, respectively, off the television monitor. The caliper program calculates, user specified, size frequency distributions by numbers and biomass. This allows current size frequency distributions (1981, 1982, 1983) to be compared with those in Section 2 of this report. The third section presents the zooplankton species counts in the species-specific size groups into which they were originally counted to facilitate comparisons with the 1969-1976 Great Central Lake work. The counts in Sections 2 and 3 are reported as numbers per cubic meter unless otherwise indicated.

ACKNOWLEDGMENTS

Many members of the Lake Enrichment limnology staff collected the samples.

Appendix table 2. Length-weight relationships used to calculate wet weights from zooplankton species counts (from Edmondson and Winberg 1971).

All copepods:

$$\text{Wet wt (mg)} = 0.03675 L(\text{mm})^{3.2218}$$

Bosmina:

$$\text{Wet wt} = 0.124L^{2.181}$$

All other cladocera:

$$\text{Wet wt} = 0.052 L^{3.012}$$
