Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Mueller, C. W. and H. J. Enzenhofer. 1991. Trawl catch statistics in sockeye rearing lakes of the Fraser River drainage basin: 1975 - 1985. Can. Data Rep. Fish. Aquat. Sci. 825: 204 p.

Under the auspices of the International Pacific Salmon Fisheries Commission (IPSFC) 11 years of pelagic fish stock information were collected using midwater trawls in Fraser River sockeye rearing lakes. The lakes sampled were: Takla, Trembleur, Stuart, Francois, Fraser, Quesnel, Adams, Shuswap, Seton, Anderson, Lillooet, Pitt, Harrison, and Cultus. After at least one month in formalin each sample was measured and weighed. Summary statistics were calculated and length frequencies were plotted by survey and species. In Shuswap Lake, where most data were collected, mean weight of juvenile sockeye in October ranged from 1.79g in dominant brood years to 2.60g in sub-dominant years.

RÉSUMÉ

Mueller, C. W. and H. J. Enzenhofer. 1991. Trawl catch statistics in sockeye rearing lakes of the Fraser River drainage basin: 1975 - 1985. Can. Data Rep. Fish. Aquat. Sci. 825: 204 p.

Pendant onze ans, sous les auspices de la Commission internationale des pêcheries du saumon du Pacifique, des données sur les stocks de poissons pélagiques ont été recueillies dans les lacs d'alevinage de saumon rouge du fleuve Fraser, à l'aide de chaluts flottants. Les lacs échantillonnés étaient les lacs Takla, Trembleur, Stuart, François, Fraser, Quesnel, Adams, Shuswap, Seton, Anderson, Lillooet, Pitt, Harrison, et Cultus. Chaque échantillon a été conservé dans le formol pendant au moins un mois, au bout duquel il a été mesuré et pesé. Des statistiques sommaires ont été établies et la fréquence des longueurs a été précisée par dénombrement et par espèce. En octobre, le poids moyen des jeunes saumons rouges du lac Shuswap, où ont été recueillies la plupart des données, variait de 1,79g, pour les années de génération où l'espèce dominait, à 2,60g, pour les années où l'espèce était moins dominante.

Trawl catch statistics in sockeye rearing lakes
of the Fraser River drainage basin: 1975 - 1985.

INTRODUCTION

The Fraser River drainage basin is 230,400 km² and covers most of south-central British Columbia (Servizi 1989) (Fig 1). It is one of the world's major salmonid systems and is the world's largest single river producer of sockeye salmon (*Oncorhynchus nerka*) (Northcote and Larkin 1989). Within this watershed there are 15 major nursery lakes for juvenile sockeye: Takla, Trembleur, Stuart, Francois, Fraser, Quesnel, Chilko, Adams, Shuswap, Seton, Anderson, Lillooet, Pitt, Harrison, and Cultus.

From 1975 to 1985, staff of the International Pacific Salmon Fisheries Commission (IPSFC) periodically collected hydroacoustic density estimates and mid-water trawl samples from these lakes. Chilko Lake was not surveyed because population estimates based on hydroacoustic assessment techniques were considered unreliable due to the distributional characteristics of fry in the lake (Goodlad et al 1974).

Lakes experiencing cyclic densities were surveyed on a regular basis during the dominant (progeny of the largest escapement of a four year cycle) and sub-dominant (progeny of the second largest escapement of a four year cycle) brood years. Trawl sample results were used to provide fish species composition and size information. The species composition information was used to apportion the hydroacoustic population estimates. The IPSFC used these population estimates to predict the potential adult returns for management of the commercial sockeye salmon fishery.

METHODS

Each study lake was divided into trawl sample areas which contained 2 or 3 randomly selected hydroacoustic transects perpendicular to shore (ie. Fig. 2). These areas and transects remained the same for each survey. The methods used to estimate fish densities using acoustic and trawl results are described in Nunnalee (1973) and in Burzcynski and Johnson (1986). Trawl samples were captured using a 3m by 7m midwater trawl capable of fishing to 64m at the middle of the mouth opening. The trawl net was similar to the one described in Enzenhofer and Hume (1989), but without the closing capability. The depth and duration of the trawl were determined by visually estimating density from the acoustic echogram. Normally only one tow per area was done but if the echogram showed that the fish were stratified into layers then a trawl was done through each layer.

Each catch was anaesthetized in a 1% solution of 2-phenoxyethanol to prevent them from regurgitating their stomach contents and then preserved in 10% formalin. Each trawl catch was labelled and a trawl log was kept recording survey, tow, area, date, time, duration of trawl, depth, and weather. The total catch from each trawl was preserved.

The catch was left for at least one month to stabilize fish size before measuring (Rogers 1964). Fish were weighed to 0.01g using a Mettler PN 1210 electronic balance and measured to the nearest mm. Scales and the anterior portion of the stomach were removed from a maximum of 20 sockeye fry for aging. Each fish was numbered consecutively to reference the stomach and scale information to fish size and to aid in error checking.

Raw data were entered into a Lotus 123 spreadsheet for statistical analysis. Each survey was entered as a separate file and was organized for analysis by tow, area and species. Sockeye were divided into age 0, age 1 and age 2+. These categories were determined from the scale aging analysis, length frequency distributions, and somewhat arbitrarily by time of year based on fry emergence. Age 0 are fry from the current year's emergence and have not been in the lake over the winter. Age 1 are from the previous year's emergence and have been in the lake over 1 winter. Age 2+ are determined to have been in the lake for 2 winters and may also include older kokanee (landlocked *O. nerka*). Kokanee occur in most sockeye rearing lakes, and in Shuswap Lake in low population years a large percentage of *O. nerka* are thought to be kokanee, but further study is required to determine this percentage.

After numbers were entered, length frequencies were plotted by survey number and species. All sockeye were plotted and where abundance exceeded 20/survey, stickleback (*Gasterosteus aculeatus*) and smelt (*Spirinchus thaleichthys*) were also plotted. Summary statistics (n, maximum, minimum, mean, standard deviation and variance) were calculated for length and weight by survey number and species and then by tow number and species.

RESULTS

In the eleven years 167 surveys were conducted and 688 tows executed. A total of 37,945 sockeye, 11,583 smelt, 7,505 stickleback, 539 sculpin (*Cottus asper*), 292 whitefish (*Coregonus clupeaformis*), 27 cyprinids and 33 others were sampled. Cyprinids sampled include reidside shiner (*Richardsonius balteatus*), northern squawfish (*Ptychocheilus oregonensis*), and peamouth chub (*Mylocheilus caurinus*). Data are organized by lake and the results are presented in tables and figures. For each lake there is a map showing areas and transects, a tow log summarizing the catch and condition of capture; a table summarizing the data by survey; a table summarizing the data by individual trawl; and a length frequency graph for each survey.

ACKNOWLEDGEMENTS

We wish to acknowledge the efforts of Ian Williams, Bob Johnson, Steve MacLellan, Ken Peters, Donna Brock, Al Drew, Peter Buck, Graham Suther, Ken Morton, Dave Barnes, Terry Gjernes, Bob Coruthers, Bob Eburne, and Bill Woodall in the collection and analysis of these data. We also wish to thank J.M.B. Hume and Vivian Ogilvie for assistance in analysis and editing of this report.
