## **Canadian Data Report of Fisheries and Aquatic Sciences**

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

## **Rapport statistique canadien des sciences halieutiques et aquatiques**

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

## ABSTRACT

Salki, A.G., and K. Patalas. 1992. The crustacean plankton of Lake Winnipeg, June to October, 1969. Can. Data Rep. Fish. Aquat. Sci. 868: iv + 16 p.

The species composition and abundance of the crustacean plankton community found in Lake Winnipeg on six sampling cruises during the period June to October, 1969 are given. Total settled volume of the net plankton collected on these cruises is also reported.

Key words: Lake Winnipeg; zooplankton; seasonal distribution; species composition; abundance.

## RÉSUMÉ

Salki, A.G., and K. Patalas. 1992. The crustacean plankton of Lake Winnipeg, June to October, 1969. Can. Data Rep. Fish. Aquat. Sci. 868: iv + 16 p.

Ce rapport présente la composition spécifique et l'abondance de la communauté des crustacés planctoniques du lac Winnipeg, telles qu'établies après six campagnes d'échantillonnage qui ont eu lieu de juin à octobre 1969. Le volume total au repos du microplancton prélevé lors de ces campagnes est également indiqué.

Mots clés: Lac Winnipeg; zooplancton; distribution saisonnière; composition spécifique; abondance.

## INTRODUCTION

Lake Winnipeg, with a surface area of 23, 750 km<sup>2</sup> (Brunskill et al. 1980) is the largest remnant of glacial Lake Agassiz in western Canada. A limnological study of the lake was conducted in 1929 by Bajkov (1930) who described biological conditions, including the zooplankton community, existing at that time. In 1969, the Freshwater Institute undertook a study to characterize the physical, chemical and biological conditions of Lake Winnipeg (see Brunskill et al. 1979; Brunskill et al. 1980; Brunskill and Graham 1979; Brunskill, Schindler, Elliott et al. 1979; Brunskill, Schindler, Holmgren et al. 1980; Kenny 1979). During the intervening 40 years, Lake Winnipeg received increased nutrient loads from municipal and agricultural sources and became a regulated storage reservoir for hydroelectric power generation. Brunskill et al. (1980) describe the regional economic growth, the increased fertilizer application and the flow and level regulation impacting the lake since 1950. The purpose of this report is to document the basic data on species composition and abundance of the crustacean plankton community found in Lake Winnipeg during the period June to October, 1969. A thorough description of the spatial and temporal distributions of species and an assessment of factors affecting these variations is presented in Patalas and Salki (1992). The publication also includes a consideration of the observed differences between this study and that of Bajkov.

## METHODS

Zooplankton samples were collected from a network of 59 stations located within eight regions of Lake Winnipeg: R, W, SB (comprising the South Basin), N (Narrows separating the South and North Basins), and NBw, NBe, NBn, S (comprising the North Basin) (Fig. 1). Regionalization was based on geographic, morphometric and hydrologic features of the lake and allowed an evaluation of the effects of these parameters of plankton distributions and dynamics. Samples to study the seasonal dynamics of zooplankton were obtained during six lakewide cruises over the period June 4 to October 31, 1969.

Cruise 1	June 4-12	36 stations
Cruise 2	July 9-16	51 stations
Cruise 3	July 24 - August 1	49 stations
Cruise 4	September 2-10	37 stations
Cruise 5	October 3-13	49 stations
Cruise 6	October 27-31	25 stations

Although the number of stations sampled in each cruise varied due to weather conditions, the lake area represented by each station in North Basin regions was roughly comparable as were those in the South Basin regions (see Patalas and Salki 1992).

At each station during daylight hours, a Wisconsin net of 25 cm mouth diameter and 73 µm mesh size was hauled vertically from just above the lake bottom to the surface at a rate of 0.5 m·s<sup>-1</sup>. Plankton samples were preserved in 10% formalin.

In the laboratory, net plankton volumes were measured after 24 hr settling in 8 x 600 mm glass tubes following the method of Bajkov (1930, 1934). Quantitative and qualitative analysis of zooplankton samples were conducted using a 63x compound microscope. At least 200 individuals were counted in 1 mL subsamples withdrawn from 40 mL samples using a calibrated 4 mm I.D. glass tube and placed in a Sedgwick-Rafter counting cell. This method provided estimates of total abundance with counting errors not exceeding 7%. Generally, more than 40 individuals of each dominant species were counted as recommended by Cassie (1971). All mature specimens and immature cyclopoid copepodids were identified to species using keys of Yeatman (1959), Wilson (1959), and Brooks (1957). Calanoid copepodids I-V, enumerated collectively, were apportioned among calanoid species in accordance with the relative abundance of adults present in the sample. Copepod nauplii were identified to family Cyclopidae and to sub-order Calanoida. Larger and/or rarer animals (Leptodora, Limnocalanus, Holopedium, etc.) were enumerated in the whole or a large (1/4-1/2) fraction of the sample under a 12x dissecting microscope. Zooplankton abundance was expressed as the number of specimens per litre, assuming the filtration efficiency of the net to be 100%. In fact, the efficiency was between 45 and 85%, averaging 63%, as indicated by later experiments. The South

and North Basin means presented for each cruise were considered to be weighted since stations within the South Basin regions represented comparable lake areas as did those in North Basin regions.

#### DATA SUMMARY

Tables 1 to 6 provide data on the composition and abundance per litre of the crustacean plankton community at individual stations in Lake Winnipeg during six sampling cruises in 1969. Weighted mean total abundances in the South and North Basins as well as the abundance of cyclopoid copepods, calanoid copepods and cladocerans found at each station during each cruise are also presented. Table 7 presents the settled net plankton volumes in lake Winnipeg during the period June to October, 1969.

#### ACKNOWLEDGMENTS

We thank the crew of the S.S. Bradbury and staff of the Freshwater Institute led by Dr. Gregg Brunskill for the many hours spent collecting the zooplankton samples for this report.
