## Canadian Data Report of Fisheries and Aquatic Sciences 885

## Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in Aquatic Sciences and Fisheries Abstracts and indexed in the Department's annual index to scientific and technical publications.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161 .

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

## Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue Résumés des sciences aquatiques et halieutiques, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

## ABSTRACT

Smith, M. S., W. T. Andrews, M. W. Saunders, G. A. McFarlane, and W. Kennedy. 1992. Results of spiny dogfish (Squalus acanthias) tagging in B.C. waters 1986 to 1989. Can. Data Rep. Fish. Aquat. Sci. 885: 130 p.

During 1987 and 1988, 10,716 spiny dogfish were tagged in British Columbia waters, 6186 in the Strait of Georgia, 894 off southwest Vancouver Island and 3636 in southeastern Queen Charlotte Sound. A total of 69,865 spiny dogfish have been tagged in British Columbia waters since 1978. As of December 31, 1989, 2621 have been recovered from all releases. Preliminary information on recoveries (2232) from Strait of Georgia releases indicates that 1749 (78\%) were recaptured in the strait of Georgia, 48 (2\%) moved north of the Strait of Georgia, 74 (4\%) moved south into Puget Sound and Juan de Fuca Strait and 78 (3.5\%) moved into outer coastal areas of Vancouver Island and Washington. In addition, 238 fish have been recovered from southwest Vancouver Island releases and 151 fish have been recovered from north coast releases.

## Résumé

Smith, M. S., W. T. Andrews, M. W. Saunders, G. A. McFarlane, and W. Kennedy. 1992. Results of spiny dogfish (Squalus acanthias) tagging in B.C. waters 1986 to 1989. Can. Data Rep. Fish. Aquat. Sci. 885: 130 p.

En 1987 et 1988 , on a étiqueté 10716 aiguillats communs dans les eaux de Colombie-Britannique : 6186 dans le détroit de Géorgie, 894 au sud-ouest de l'ile de Vancouver et 3636 dans le sud-est du bassin de la Reine-Charlotte. Au total, 69865 aiguillats communs ont été marqués depuis 1978 dans les eaux de la province. Au 31 décembre 1989, on avait récupéré 2621 des poissons marqués. Les données préliminaires sur les récupérations d'aiguillats (2 232) marqués dans le détroit de Georgie indiquent que 1749 poissons ( 78 \%) ont été repris dans le détroit, 48 ( $2 \%$ ) sont sortis du détroit par le nord, 74 ( 4 \% ) se sont retrouvés au sud, dans le Puget Sound et le détroit de Juan de Fuca, et $78(3,5 \%)$ se sont déplacés plus au large devant les côtes de l'ile de Vancouver et de l'État de Washington. En outre, on a repris 238 aiguillats marqués au sud-ouest de lifle de Vancouver, et 151 marqués sur la côte nord.

This is the seventh report describing the results of the spiny dogfish (Squalus acanthias) tagging program. This report is similar in format to previous reports (Brown et al. 1979; Beamish et al. 1981; McFarlane et al. 1982; Smith et al. 1983; Saunders et al. 1985; Smith et al.1989), and presents release information for taggings conducted during 1987 and 1988 (Table 1), and recovery information to December 31, 1989. Individual fish recovery information is not included.

The primary purpose of the program is to examine the movement of dogfish throughout British Columbia waters.

MATERIALS AND METHODS

A total of five dogfish tagging cruises were conducted during 1987 and 1988 (Table 1). Dogfish were tagged in the Campbell River area in May-June of 1987 and 1988 by students and staff of the Campbell River School district on board the chartered fishing vessel "INVADER NO.1". Pacific Biological Station staff conducted other operations during January 1987 in the southeastern Queen Charlotte Sound area aboard the chartered fishing vessel OCEAN ROAMER; during February 1987 off the southwest coast of Vancouver Island aboard the research vessel W.E. RICKER and during June 1988 off Qualicum Bay in the central section of the Strait of Georgia, aboard the chartered fishing vessel VIVID.

Longline gear was used during all cruises in the Strait of Georgia and in the southeast Queen Charlotte Sound area. The longline gear consisted of Mustad $12 / 0$ stainless steel halibut hooks (quality 9401) with the barbs bent over, fastened to a braided nylon gangion 55 cm long. All hooks were baited with frozen herring and attached to the the groundline with snaps every 2 or 3 m as the line was set over the stern of vessel. The line was retrieved after a suitable soak time. Soak time was defined as the time of the first hook overboard and time of the first hook retreived.

A highlift Engel bottom trawl with a light groundline was used on board the R/V W.E. RICKER. Records were maintained of all pertinent set and recovery information.

After capture all fish were placed in live tanks with continuously flowing sea water. Fish were removed from the live tanks and anaesthetized in a smaller tank containing 150 L of seawater and 25 mg of tricaine methane sulphonate (MS 222). When the fish appeared lethargic they were removed from the anaesthetic, measured, sexed, tagged and released. All fish were measured for total length, described as the distance measured between the tip of the snout and the tip of the upper lobe of the caudal fin when it is directed downward in a straight line with the body. Records were kept of area of capture and release as well as general condition of the fish, small injuries and problems with the tag. on board the R/V W.E. RICKER, fish were held up to one hour after tagging in live tanks prior to release.

Most fish were tagged with a modified Petersen disc (McFarlane and Beamish 1986). A new flexible modified Petersen disc was introduced to the tagging program in the Campbell River area during May-June 1988 (Table 1). This tag is approximately the same size as the modified Petersen disc, but constructed of a single layer of soft plastic material. All fish were tagged using the same procedure described previously (Brown et al.1979; Beamish et al.1981; McFarlane et al. 1982)

A recovery was considered usable when the whole tagged fish or the tags alone were received. For all recoveries, information regarding location, fishing method, fishing depth and date of recapture, along with the fisherman's name, address and telephone number were recorded. Specific recovery location was recorded as 'unknown' for processing plant recoveries where accurate information was not available.

When whole tagged fish were recovered additional information was recorded including recapture length, sex, condition of the tags and severity of the tag wound. The first dorsal fin spine was removed complete with the applied tag and frozen. The second dorsal fin spine was also removed for ageing. If the tagged fish was injected with OTC at release, the second dorsal spine was examined under an ultra violet lamp to determine if a mark was present and if so, the quality of the OTC mark was noted.

Prior to 1989 reward of $(\$ 3.00)$ was paid for the return of the tags only, and because the second dorsal spine is required for age determination studies a higher reward ( $\$ 5.00$ ) was paid for the return of whole tagged dogfish. During 1989 incentives to return tags and whole dogfish with tags were increased to ( $\$ 5.00$ ) for the return of either the tag or whole fish. The reporter has his choice of either a monetary reward or a tag
recapture ball cap with a distinctive crest designed especially for this progam.

Titanium pins from tags that had been at large 7, 9 and 10 years respectively were forwarded to the Defense Research Establishment at Victoria for examinination of corrosion using scanning electron microscopy.

## RESULTS AND DISCUSSION

## RELEASES

A total of 10,716 dogfish were tagged and released during 1987 and 1988 (Table 1). A reference map of release place names is presented in Figure 1. Summary set location and capture data are presented in Table 2 for southeast Queen Charlotte Sound, January 1987, in Tables 3 and 4 for the Campbell River area taggings, during 1987 and 1988 respectively, and in Table 5 for Qualicum Bay area in 1988. Set location and capture data for the R/V W.E. RICKER cruise is included in Appendix table 1. Catch information by cruise and set is available in Appendix tables 2 to 5. Release data by set including numbers of males and females released, release location, and tag series numbers are presented for all cruises in Tables 6 to 10. Summaries of incidental species caught during the cruises are listed in Tables 11 and 12.

Lists of common and scientific names of fishes encountered during these tagging cruises are included in Table 13. Summaries of length frequencies of fish released by cruise are presented in Table 14. Detailed information of length frequencies of released fish by cruise and set are included in Appendix tables 6 to 10 .

In January 1987 a tagging experiment was conducted in the southeastern sections of Queen Charlotte Sound. During this cruise 22 longline sets (18,744 hooks; range 400 to 1,055 ) were completed. Duration of the "soak" ranged from 78 to 772 minutes per set (overnight) and depths ranged from 97 to 196 metres. Three thousand eight hundred and twenty-five spiny dogfish were captured (Table 2). A total of 3,636 fish were tagged, including 1101 in the Pine Island area, 1,679 off Egg Island, 61 in Smith Sound, 683 in the entrance of Rivers Inlet, 104 in Cormorant Channel and 197 in Blackfish Sound (Table 6). Females
predominated (60\%) ranging in size from 51 cm to 125 cm with modes at 100 cm and 91 cm while males ranged in size from 52 cm to 105 cm with a mode at 85 cm . (Table 14; Appendix table 6).

In May-June 1987 fishing effort was directed in the Campbell River area where 27 longline sets ( 10,603 hooks; range 306 to 411 hooks per set) were completed. Soak time ranged from 45 to 95 minutes and depths ranged from 27 to 146 metres. Two thousand nine hundred and eighty-seven spiny dogfish were captured (Table 3). A total of 2,570 fish were tagged in the Cape Mudge - Francisco Point area and 272 fish were tagged south of Marina Island (Table 7). Males predominated (78\%) ranging in size from 44 cm to 97 cm with a mode at 80 cm . Females ranged in size from 46 cm to 117 cm with a mode at 100 cm . (Table 14; Appendix table 7).

In May-June 1988 fishing effort was also directed at the Campbell River area where 27 longline sets ( 8,135 hooks; range 287 to 315 hooks per set) were completed. Soak time ranged from 35 to 130 minutes and depths ranged 18 to 170 metres. A total of 2,646 spiny dogfish were captured (Table 4). Most dogfish ( 2,464 fish) were tagged in the Cape Mudge area and 48 fish were tagged off Shelter Point 3 mi . S. of Cape Mudge (Table 8). Once again males predominated (85\%) ranging in size from 42 cm to 99 cm with modes at 83 cm and 64 cm . Females ranged in size from 42 cm to 121 cm with modes at 102 cm and 97 cm . (Table 14; Appendix table 8). During this cruise $1,197 \mathrm{fish}(46 \%)$ had the flexible modified Petersen disc applied.

During June 1988, as part of a dogfish predation study 880 dogfish were tagged off Qualicum Bay near the location of a major salmon hatchery. Thirty-six sets (approximately 10,750 hooks; range 250 to 300 hooks per set) were completed. Soak times ranged from 12 to 68 minutes and depths ranged from 13 to 77 metres. A total of 884 dogfish were captured (Table 5). Slightly more males (55\%) were tagged than females (Table 9). Males (480 Eish) ranged in size from 49 cm to 99 cm with a modal size of 80 cm . Females ( 400 fish) ranged in size from 49 cm to 119 cm with a modal size of 73 cm (Table 14 ; Appendix table 9).

During February 1987, a total of 17 trawl hauls were completed aboard the R/V W.E. RICKER off the southwest coast of Vancouver Island. Trawl hauls ranged from 19 to 43 minutes in duration and 48 to 152 metres in depth (Appendix table 1). A total of 894 dogfish were tagged (Table 10). Once again males predominated $66.5 \%$ ( 595 fish ) and ranged in size from 55 cm to 97 cm with a mode at 85 cm . Females ( 298 fish ) ranged in size from 53 cm to 119 cm with modes at 103 cm and 65 cm . (Table 14;
Appendix table 10).

RECAPTURES 1978 - 1989

A total of 69,865 spiny dogfish have been tagged and released since 1978 (Table 1), 9,377 in north coast waters which include Dixon Entrance, Hecate Strait, Queen Charlotte Sound and Queen Charlotte Strait; 9,915 off southwest Vancouver Island and 50,574 in the Strait of Georgia. As of December 31, 1989, a total of 2,621 (3.8\%) tagged fish have been recovered; 151 (1.6\%) of north coast, 238 (2.4\%) of the southwest Vancouver Island, and 2,232 ( $4.4 \%$ ) of the Strait of Georgia releases (Tables 16). Recaptures have been made throughout the north Pacific Rim. Recovery locations by area of release are presented in Table 15.

## RECAPTURES FROM STRAIT OF GEORGIA RELEASES

As of December 31, 1989 a total of 2232 (4.4\%) tagged dogfish were recovered from Strait of Georgia releases (Tables 15 and 16). Most of the fish (1,749; 78\%) were recovered in the Strait of Georgia and 1,049 (47\%) were recovered in the same section as their release. Few fish were recovered north of the Strait of Georgia; 27 (1.2\%) from Johnstone Strait and 20 (0.9\%) from Queen Charlotte Sound and Hecate Strait. To the south; 32 (1.4\%) and 47 (2.1\%) were recovered from Puget Sound and Strait of Juan de Fuca respectively. A further 48 (2.2\%) and 29 (1.3\%) were recovered from the outer coastal area of Vancouver Island and Washington State, single recoveries were made from Oregon and Alaska. A further, 409 (18\%) Strait of Georgia tag recoveries were listed as either unknown Strait of Georgia (131, 5.8\%), unknown Canadian (169, 7.5\%) or unknown (109; 4.9\%) (Table 15).

RECAPTURES FROM SOUTHWEST COAST VANCOUVER ISLAND RELEASES

As of December 31, 1989, a total of 238 (2.4\%) tagged dogfish have been recovered from south west coast of Vancouver Island releases (Table 15 and 16). Most of the fish (100; 42\%) were recovered in the area of release. Four fish were recovered north of the tagging area including 1 from Alaska and 4 from Hecate Strait and 27 were recovered south of the tagging area including 15 ( $6.3 \%$ ) from off Washington, 8 (3.4\%) from oregon and 4 (1.7\%) from California. Thirty-five fish were recovered from inner coastal locations including 19 (17.5\%) from the strait of Georgia, 7 (2.9\%) from Puget Sound and 9 (3.8\%) from strait of

Juan de Fuca. Four fish were recovered from Japan and one from Mexico. A further 68 (29\%) were listed as either unknown Canadian (30, 12.6\%) or unknown (37, 15.5\%).

RECAPTURES FROM NORTH COAST OF BRITISH COLUMIBA RELEASES

As of December 31, 1989 a total 151 (1.6\%) tagged dogfish were recovered from north coast releases (Tables 15 and 16). Thirty-nine (26\%) tagged fish were recovered in Hecate Strait, 30 ( $20 \%$ ) off the west coast of Vancouver Island and 14 (9\%) from Queen Charlotte Sound. Other recoveries include 1 from Alaska, 1 from the west coast of the Queen Charlotte Islands, 1 from Johnson Strait, 12 ( $8 \%$ ) from the Strait of Georgia, 2 from Puget Sound, 3 from the Strait of Juan de Fuca; 4 (3\%) from offshore Washington and 2 from Oregon. Eight fish were recovered from Japan and one from California. A further 36 (23.8\%) were listed as either unknown Canadian (18, 11.9\%) or unknown (15, 9.9\%).

RECOVERY METHODS

Tagged dogfish were recaptured in all types of fisheries (Table 17). Directed fisheries for dogfish recaptured most (56\%) of the tagged fish; bottom fish trawl 773 (29\%) fish, longline 605 (23\%) fish, sunken gillnet 94 (4\%) fish and prawn bait 17 (1\%) fish. Other fisheries that recaptured tagged fish included sports (troll and bait) 340 (13\%)fish, commercial salmon (gillnet, troll and seine) 203 ( $8 \%$ ) fish, hake midwater 45 ( $2 \%$ ) fish, handline (rockfish and lingcod) 45 (2\%) fish, shrimp bottom trawl 14 ( $0.5 \%$ ) fish, halibut longline 12 ( $0.5 \%$ ) fish, and trap (crab and sablefish) 9 ( $0.4 \%$ ) fish. A further 449 ( $18 \%$ ) had no information on recovery method.

Samples of the titanium pins from 3 different releases that were at large 7,9 and 10 years respectively, showed no signs of corrosion.

## ACKNOWLEDGEMENTS

This study continues to provide specific information that assists in ecological studies, stock assessment and the development of management strategies for spiny dogfish. It has allowed high school students to participate in the execution of a practical biological research project. In part, the success of this study is a direct result of the of the participation and enthusiasm of Campbell River Senior Secondary and Southgate Secondary schools. Bill Kennedy coordinated teachers and student teams from the two schools. Chrys Neville of the Pacific Biological Station coordinated tagging crews in the Qualicum Bay area. Thanks are extended to Captain Hugh Watson of the M/V INVADER NO 1, Captain John Wilkes, and crew of the M/V VIVID and Captain Bruce Whittaker and crew of the M/V OCEAN ROAMER. Jim Moores of Defense Research Establishment Pacific (DNP) at Victoria completed examination of the titanium pins.

We thank fishermen throughout the Pacific Rim including Canada, U.S.A., Japan and Mexico and the state and federal agencies of those nations that assisted the fishermen, in forwarding the tags with information.

Table 13. List of common and scientific names of fishes captured during spiny dogfish tagging cruises conducted during 1987 and 1988.

Common Names
Scientific Names

## FLATFISH

Arrowtooth flounder (turbot)
Curlfin sole
Dover Sole
English Sole
Pacific halibut
Pacific sanddab
petrale sole
Rex sole
Rock sole
slender sole
Starry flounder

## ROUNDFISH

## Anchovy

Eelpouts
Chinook salmon
Coho salmon
Midshipman
Pacific hake
Pacific herring
Lingcod
Pacific cod
Pacific tomcod
Sablefish/Blackcod
American Shad
Pile perch
Shiner sea perch
walleye pollock
Giant wrymouth

## SELACHII

## Ratfish

Skate
Bi.g skate
Black skate
Longnose skate
Soupfin shark
spiny dogfish

## ROCKFISH

Boccacio
Canary rockfish
Copper rockfish
Dark blotched rockfish
Green stripe rockfish
Quillback rockfish
Yelloweye rockfish
Yellowtail rockfish

Atheresthes stomias
Pleuronichthys decurrens
Microstonmus pacificus
parophrys vetulus
Hippoglossus stenolepis
Citharichthys sordidus
Eopsetta jordani
Glyptocephalus zachirus
Lepidopsetta bilineata
Lyopsetta exilis
Platichthys stellatus

Engraulis mordax mordax Zoarcidae
Oncorhynchus tshawytscha
ㅇ. kisutch
Porichthys notatus
Merluccius productus
Clupea harengus pallasi
ophiodon elongatus
Gadus macrocephalus
Microgadus proximus
Anoplopoma fimbria
Alosa sapidissima
Rhacochilus vacca
Cymatogaster aggreqata
Theragra chal cogramma
Delolepis gigantea

Hydrolagus colliei
Rajidae
Raja binoinoculata
R. kincaidi
R. rhina

Galeorhinus zyopterus
Squalus acanthias

Sebastes paucispinis
S. pinniger
S. caurinus
S. crameri
s. elongatus
S. maliger
S. ruberrimus
S. flavidus
