## How to obtain more information

For information about this product or the wide range of services and data available from Statistics Canada, visit our website, [www.statcan.gc.ca](http://www.statcan.gc.ca).

You can also contact us by

**e-mail** at [infostats@statcan.gc.ca](mailto:infostats@statcan.gc.ca)

**telephone**, from Monday to Friday, 8:30 a.m. to 4:30 p.m., at the following toll-free numbers:

- Statistical Information Service 1-800-263-1136
- National telecommunications device for the hearing impaired 1-800-363-7629
- Fax line 1-877-287-4369

### Depository Services Program

- Inquiries line 1-800-635-7943
- Fax line 1-800-565-7757

## To access this product

This product, Catalogue no. 62-011-X, is available free in electronic format. To obtain a single issue, visit our website, [www.statcan.gc.ca](http://www.statcan.gc.ca) and browse by "Key resource" > "Publications."

## Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, this agency has developed standards of service that its employees observe. To obtain a copy of these service standards, please contact Statistics Canada toll-free at 1-800-263-1136. The service standards are also published at [www.statcan.gc.ca](http://www.statcan.gc.ca) under "About us" > "The agency" > "Providing services to Canadians."

## Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0<sup>s</sup> value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- P preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published
- \* significantly different from reference category ( $p < 0.05$ )

## Note on CANSIM

Data that appears in the **Industry Price Indexes** (catalogue no. 62-011-X) are also available electronically in our CANSIM (Canadian Socio-Economic Information Management System) database through the Internet tables 329-0056 to 329-0068 and 330-0007. In general, *CANSIM* provides a longer historical series. For further information on *CANSIM* call 1-800-263-1136.

## Revision

Unless otherwise stated, price indexes in this publication are subject to revision for the most recent six months shown. Any revisions beyond these limits are so indicated.

I Use of Link factors for IPPI and RMPI	169
---	-----

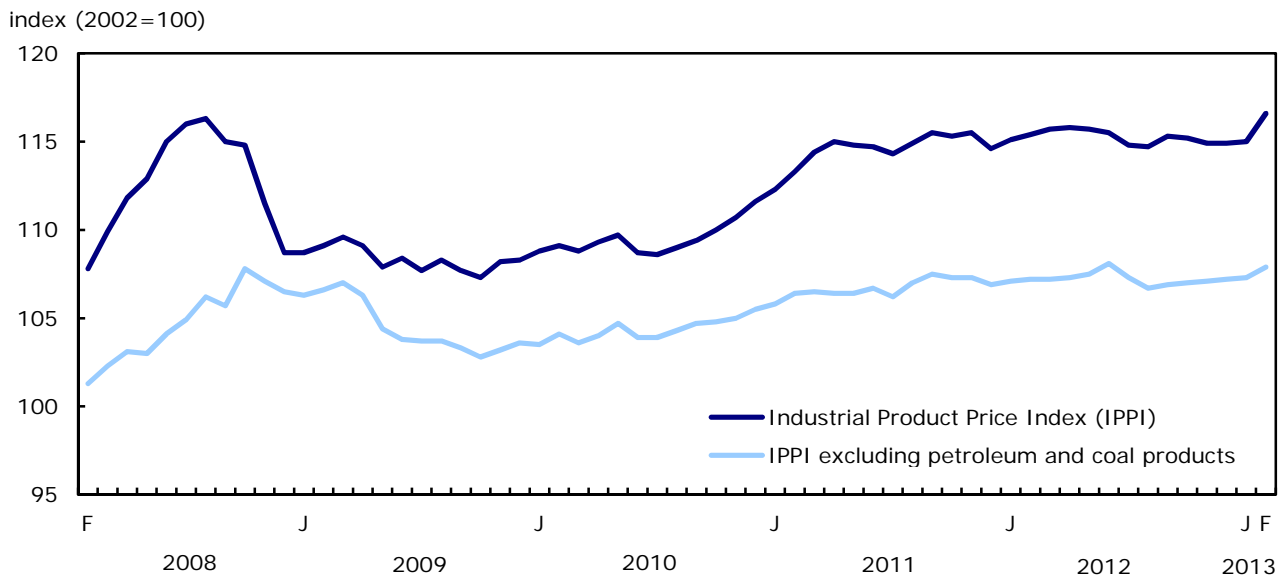

## Highlights

---

- After remaining nearly unchanged in the last few months, the Industrial Product Price Index (IPPI) grew 1.4% in February, its largest advance since June 2008.
- The petroleum and coal products group posted its largest gain since March 2011.
- Compared with February 2012, the IPPI increased 1.0%.
- Compared with the same month a year earlier, the advance of the IPPI was largely a result of petroleum and coal products.
- The Raw Materials Price Index (RMPI) rose 2.2% in February, the second consecutive monthly advance.
- The increase of the index was mostly a result of mineral fuels.
- Compared with the same month one year earlier, the RMPI decreased 2.0%, continuing the downward trend that began in March 2012.

## Analysis

---

The Industrial Product Price Index (IPPI) rose 1.4% in February, led by higher prices for petroleum and coal products.

The Raw Materials Price Index (RMPI) increased 2.2% as a result of higher prices for crude oil.

### Industrial Product Price Index, monthly change

After remaining nearly unchanged in the last few months, the IPPI grew 1.4% in February, its largest advance since June 2008. Although petroleum and coal products were mainly responsible for the increase, all major commodity groups except meat, fish and dairy products were up.

The petroleum and coal products group (+6.6%) posted its largest gain since March 2011. Price increases were observed for most products, including gasoline (+8.3%) and diesel fuel (+5.6%). The increase in gasoline prices was partly attributable to reduced supply and higher world prices for crude oil. The IPPI excluding petroleum and coal products rose 0.6% in February.

Motor vehicles and other transportation equipment (+1.0%) also contributed to the advance of the IPPI in February, primarily as a result of higher prices for motor vehicles. The depreciation of the Canadian dollar against the US dollar was largely responsible for this increase.

Some Canadian producers who export their products report their prices in US dollars. Consequently, the 1.8% decrease in the value of the Canadian dollar relative to the US dollar may have the effect of increasing the IPPI. Without the measurable effect of the exchange rate, the index would have risen 1.0% instead of 1.4%.

Among the other commodity groups that contributed to the upward movement was primary metal products (+1.3%), specifically aluminum products (+2.5%), copper and copper alloy products (+2.7%) and other non-ferrous metal products (+1.0%). Prices for primary metal products have been fluctuating on a monthly basis since November 2012.

In contrast, meat, fish and dairy products (-0.3%) declined because of lower prices for meat products. It was the only major commodity group that decreased in February.

### Industrial Product Price Index, 12-month change

Compared with February 2012, the IPPI increased 1.0%, after edging down 0.1% in January.

Compared with the same month a year earlier, the advance of the IPPI was largely a result of petroleum and coal products (+3.6%), specifically diesel fuel (+5.0%) and gasoline (+3.4%). The IPPI excluding petroleum and coal products was up 0.7% on a year-over-year basis.

With a 9.7% increase, lumber and other wood products also made a substantial contribution to the year-over-year increase of the IPPI. Higher prices for lumber and ties (+18.1%) were largely responsible for the increase. Prices for lumber and other wood products continued the upward trend observed since February 2012.

Motor vehicles and other transportation equipment posted a 1.0% year-over-year gain, mostly a result of the 1.3% depreciation in the Canadian dollar relative to the US dollar. Without the measurable effect of the exchange rate, the IPPI would have risen 0.7% instead of 1.0% on a year-over-year basis.

Among the other commodity groups that posted increases was fruit, vegetables and feeds (+2.3%), specifically feeds (+10.9%).

In contrast, the increase of the IPPI was moderated mainly by primary metal products (-3.8%). The largest year-over-year declines were in iron and steel products (-2.8%), aluminum products (-5.4%) and nickel products (-12.2%).

### Raw Materials Price Index, monthly change

The RMPI rose 2.2% in February, the second consecutive monthly advance. All major product groups were up, except for non-metallic minerals.

The increase of the index was mostly a result of mineral fuels (+3.3%), particularly crude petroleum (+3.5%). The RMPI excluding mineral fuels was up 1.3% in February.

Upward pressure was also exerted on the RMPI by non-ferrous metals (+2.7%), which increased mainly because of higher prices for copper concentrates (+3.8%) and zinc concentrates (+6.2%).

### Raw Materials Price Index, 12-month change

Compared with the same month one year earlier, the RMPI decreased 2.0%, continuing the downward trend that began in March 2012.

The decline of the RMPI was largely because of mineral fuels (-4.8%), specifically crude petroleum (-4.8%). The RMPI excluding mineral fuels increased 0.7% on a year-over-year basis.

Compared with February 2012, non-ferrous metals (-1.0%) were also down, primarily as a result of lower prices for radioactive concentrates (-15.8%) and precious metals (-6.3%).

The year-over-year decline of the RMPI was moderated slightly by vegetable products (+4.5%), wood products (+2.7%) and animals and animal products (+1.0%).

#### Note to readers

All data in this release are seasonally unadjusted and usually subject to revision for a period of six months (for example, when the July index is released, the index for the previous January becomes final).

The **Industrial Product Price Index** (IPPI) reflects the prices that producers in Canada receive as the goods leave the plant gate. It does not reflect what the consumer pays. Unlike the Consumer Price Index, the IPPI excludes indirect taxes and all the costs that occur between the time a good leaves the plant and the time the final user takes possession of it, including the transportation, wholesale, and retail costs.

Canadian producers export many goods. They often indicate their prices in foreign currencies, especially in US dollars, which are then converted into Canadian dollars. In particular, this is the case for motor vehicles, pulp, paper and wood products. Therefore, a rise or fall in the value of the Canadian dollar against its US counterpart affects the IPPI. But the conversion into Canadian dollars only reflects how respondents provide their prices. This is not a measure that takes the full effect of exchange rates into account.

The conversion of prices received in US dollars is based on the average monthly exchange rate (noon spot rate) established by the Bank of Canada, and it is available on CANSIM in table 176-0064 (series v37426). Monthly and annual variations in the exchange rate, as described in the release, are calculated according to the indirect quotation of the exchange rate (for example, CAN\$1 = US\$X).

The **Raw Materials Price Index** (RMPI) reflects the prices paid by Canadian manufacturers for key raw materials. Many of those prices are set on the world market. However, as few prices are denominated in foreign currencies, their conversion into Canadian dollars has only a minor effect on the calculation of the RMPI.

**Note(s):** Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

2013	76.3	76.3	..	..	..	..	..	..	..	..	..	..	..

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

**Note(s):** Indexes for the most recent six months shown are subject to revision. Indexes for the most recent six months shown are subject to revision. The aggregation of indexes by commodity or by industries should produce the same grand total. When these totals occasionally differ due to rounding, the All Commodities Index shall be regarded as authoritative, and the All Manufacturing Industries is adjusted to match. The numeric code preceding the CANSIM series number is the 2002 North American Industry Classification System (NAICS) code.

## Industrial Product Price Indexes (2002=100)

---

The Industrial Product Price Indexes (IPPI) measures price changes for major commodities sold by Canadian manufacturers. Elemental indexes are calculated for 944 Principal Commodity Group Aggregates (PCGA) outputs as defined in the 2002 Input-Output tables. Weights used to aggregate commodity indexes are taken from the output or “Make” matrix of the Input-Output tables of the Canadian System of National Accounts (SNA) which provides an integrated set of commodity values for all manufacturing industries.

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

Selected indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (catalogue no. 11-001-X) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in tables 329-0056 to 329-0068 or by request.

Each release of index numbers is subject to revision for six months, (for example, when the July index is released, the index for the preceding January becomes final). Exceptions to this rule are announced.

### Price surveys

About 6,000 price quotes are collected monthly from about 1,700 producers for goods sold, which are valued at the boundary of the establishment, wherein the cost of taxes collected at that point and transportation provided by public carriers beyond that point are excluded. Prices are reported for finely specified transactions wherein both the good and terms of sale are identified. Such collections are instituted for important commodities. Expansions are made to the samples where price movement has a regional dimension or where there are important flows of goods to export markets.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are “must take” respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 3 to 15 price quotes. An index may be derived from as few as 3 quotes or as many as 30 quotes.

Estimated percentage shares (by weight in the IPPI) of the collection methods used in the construction of the IPPI: Direct Mail survey (80%) Telephone Interviews (10%) Extraction of data from other sources (10%).

### Weight base

The composite indexes are weighted averages of the elemental indexes. For the IPPI, commodity and industry weights are taken from the output matrix of the 2002 Input-Output tables produced by the Industry Accounts Division of the Canadian System of National Accounts (SNA). These tables are derived from shipment values reported for the 2002 Annual Survey of Manufactures (ASM) and edited to conform to the industry classification (i.e. NAICS). However, each December, company/product weights within a commodity index can be changed in order to reflect important changes in production patterns. The entire weighting scheme for the IPPI is generally revised every 5 years. The current time base and weight base is 2002=100.

## Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

The general formula used for the main aggregations describes the price movement of a specified group of commodities where  $w_i$  are the values of the output of each commodity:

Figure 1

### Industrial Product Price Index Equation

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$  denotes the composite price index movement between the base period  $o$  and time  $t$  for the defined aggregate;

$w^i$  is the transaction value of the element  $i$  in the base period;

$P_{t/o}^i$  is the price index for element  $i$ , meaning its price change from the base period to time  $t$ ;

$\sum_i$  indicates summation over all elements  $i$  in the defined aggregate.

## Historical data

The historical series consist of all data for the months prior to January 2002. They were obtained by linking together indexes from the 2002-based IPPI series and the corresponding 1997-based IPPI series. These historical series were obtained by rebasing the 1997-based IPPI series using, as the rebasing factor, the ratio of 100 to the annual average index of 2002.

Historical series on the 2002 base for the Industry Price Indexes are available on CANSIM. The historical series are computed for the industry indexes classified under the 2002 North American Industry Classification System (NAICS) and for commodity indexes classified under the Principal Commodity Group Aggregates (PCGA) classification. A set of CANSIM vector *concordance tables* between both sets of IPPI series are available to the public.

## Raw Materials Price Indexes (2002=100)

---

The Raw Materials Price Indexes (RMPI) measures price changes for raw materials purchased by industries in Canada for further processing. The term "raw material" refers either to a commodity that is sold for the first time after being extracted from nature, or a substitutable recycled product. For example, wheat is considered as a raw material, but wheat flour is not; iron ore is but not pig iron; coal is but not electricity. Approximately 80 commodities are priced in the index, grouped into seven major components. For the RMPI, commodity weights are taken from the input matrix of the 2002 Input-Output tables of the Canadian System of National Accounts (SNA).

Directly surveyed commodities are supported by formal sampling procedures. Such indexes are derived from prices reported for the 15th of the month or the nearest prior business day for comparable transactions.

The index and the major group indexes are published about four weeks after the reference month in Statistics Canada's *The Daily* (catalogue no. 11-001-X) following a pre-announced schedule of release dates. Simultaneously, all the indexes become available on CANSIM in tables 330-0007 or by request.

Each release of index numbers is subject to revision for six months, (for example, when the July index is released, the index for the preceding January becomes final). Exceptions to this rule are announced.

### Price surveys

Data are collected directly from survey respondents, extracted from administrative files and derived from other Statistics Canada surveys and/or other sources. As a purchasers' price index, prices include all charges purchasers incur to bring a commodity to the establishment gate. They include transportation charges, net taxes paid, custom duties, as well as subsidies, if applicable.

Sampling for any directly surveyed elemental index is usually done by a formal probability sampling procedure. Important producers are "must take" respondents. A random selection is taken from the smaller producers. These samples are redrawn on a regular cycle as dictated by changes in the market. A directly surveyed elemental index is usually supported by 3 to 15 price quotes. An index may be derived from as few as 3 quotes or as many as 30 quotes.

In the RMPI, approximately 34% of the data are collected by direct mail survey, 60% of the data from administrative sources and the remaining 6% from imputation, usually from a similar commodity at the next stage of processing.

### Weight base

The composite indexes are weighted averages of the elemental indexes. For the RMPI, commodity weights are taken from the input matrix of the 2002 Input-Output tables produced by the Industry Accounts Division of the Canadian System of National Accounts (SNA). These tables provide values at purchasers' prices of commodities purchased as intermediate inputs. Within individual commodity indexes, the prices are weighted according to their market share. If data are not available, the prices are equally weighted. Each December, product weights within a commodity index can be changed in order to reflect important changes in production patterns. The entire weighting scheme for the RMPI is generally revised every 5 years. The current time base and weight base is 2002=100.

### Formula

Chained series of fixed weighted price indexes are calculated by a linking procedure whereby more recent varieties and changes to establishments are introduced systematically, as required, in December of each year. Weights from the commodity level through higher levels of aggregation are held constant.

Indexes for aggregates of individual raw materials are calculated according to the following formula:

**Figure 2**

**Raw Materials Price Index Equation**

$$P_{t/o}^{(agg)} = \sum_i \frac{w^i}{\sum w^i} \cdot P_{t/o}^i$$

$P_{t/o}^{(agg)}$  denotes the composite price index movement between the base period  $o$  and time  $t$  for the defined aggregate;

$w^i$  is the transaction value of the element  $i$  in the base period;

$P_{t/o}^i$  is the price index for element  $i$ , meaning its price change from the base period to time  $t$ ;

$\sum_i$  indicates summation over all elements  $i$  in the defined aggregate.

**Historical data**

The historical series consist of all data for the months prior to January 2002. They were obtained by linking together indexes from the 2002-based RMPI series and the corresponding 1997-based RMPI series. These historical series were obtained by rebasing the 1997-based RMPI series using, as the rebasing factor, the ratio of 100 to the annual average index of 2002. A set of CANSIM vector *concordance tables* between both sets of RMPI series are available to the public.

## Electric Power Selling Price Indexes, Non-residential (2009=100)

---

Electric Power Selling Price Indexes are published on a regional and provincial basis for two broad industrial customer categories of sales; for bills less than 5000 kW and for sales of 5000 kW or more. Prices are reported by electric utilities for non-interruptible power contracts with manufacturing, service, and other Canadian industrial customers. Monthly prices are collected from all major generating and distributing utilities three times a year. The resulting indexes are released with other monthly Industry Price Indexes for April, August and December of each year. The indexes have 2009 as a time reference base and the weights used are 2009 company revenues from sales of electricity, as collected by Producer Prices Division.

The formula used to calculate the Electric Power Selling Price Indexes is a fixed weighted index formulation, which is the same as that described in the explanation of methods used for the Industrial Product Price Indexes, 2009 =100. The indexes are available on CANSIM in table 329-0073. Indexes for the current year and the previous year are subject to revision.

## Use of Link factors for IPPI and RMPI

To convert a 2002-based index to a 1997 base, just look for the appropriate link factor and multiply the index of the 2002 based series by that factor. Expressed as a formula, the calculation is:

$$P_{/02} \times f = P_{/97}$$

where  $P_{/02}$  is a 2002-based index,  $P_{/97}$  is a 1997-based index and  $f$  is the link factor.

Conversely, to convert the 1997-based index to a 2002 base, just look for the appropriate link factor in the following appendix tables and divide the index of the 1997 based series by that factor. Expressed as a formula, the calculation is:

$$P_{/97} \div f = P_{/02}$$

Link factors are available upon request.
