Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published
- * significantly different from reference category ($p < 0.05$)

Notice to readers

Estimates released in this publication are based on the 2011 Census counts adjusted for census net undercoverage and incompletely enumerated Indian reserves to which is added the estimated demographic growth for the period going from May 10, 2011 to the date of the estimate.

These estimates are not to be mistaken with the 2011 Census counts.

The analysis in this publication is based on preliminary data. These data will be revised over the coming years, and it is possible that some trends described in this publication will change as a result of these revisions. Therefore, this publication should be interpreted with caution.

Most of the components, used to produce preliminary population estimates, are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

Acknowledgements

The analysis of this publication was prepared by André Lebel and Julien Bérard-Chagnon with the collaboration of Hélène Landry and Julie Dussault, all of the Population estimates section of the Demography division of Statistics Canada. The authors would also like to thank for their valuable comments: Geneviève Ouellet, Katherine Morton, Yvan Clermont, Hubert Denis, Shirley Loh and Patrick Charbonneau.

Highlights

- On July 1, 2013, Canada's population was estimated at 35,158,300, up 404,000 or 1.2% over the last year (2012/2013).
- This increase was equal to the one observed in the previous year (2011/2012) and similar to the average increase for the last 30 years (+1.1%).
- Since 1993/1994, net international migration has been the main source of population growth for Canada. In 2012/2013, net international migration was responsible for two-thirds of the country's population growth.
- Population growth for 2012/2013 was low in the Atlantic provinces, even negative in Nova Scotia (-0.5%), and in general high in the Western provinces.
- Growth exceeded the national level (+1.2%) in Alberta (+3.4%), Nunavut (+2.5%) and Saskatchewan (+1.9%).
- Record levels of net international migration and net interprovincial migration to the province explain this growth in Alberta.
- In the Atlantic provinces, low growth was mainly explained by a low natural increase and a six-year high losses due to interprovincial migration.
- Net interprovincial migration was positive for only two provinces: Alberta (+52,700) and Saskatchewan (+1,800).
- Alberta mainly benefited from migratory exchanges with certain provinces, with net gains of +22,400 from Ontario, +11,200 from British Columbia, +4,900 from Nova Scotia and +4,200 from Quebec.
- According to preliminary estimates, 5,379,600 Canadians, that is 15.3% of the population, were aged 65 and over on July 1, 2013. By comparison, the proportion of Canadians aged 65 and over was 9.9% on July 1, 1983, that is 30 years earlier.
- As of July 1, 2013, the median age of the Canadian population was 40.2 years. The median age was higher for women (41.1 years) than men (39.4 years).
- As of July 1, 2013, the number of children aged 14 and under was estimated at 5,674,100. They represented 16.1% of the total population, down from 21.8% on July 1, 1983.
- All age groups over 40 posted higher growths than the national average between 1983 and 2013. The largest increases happened in age groups aged 80 and over. In contrary, three age groups saw their numbers decrease during that period: the 20 to 24 (-2.4%), the 10 to 14 (-1.1%) and the 15 to 19 (-0.6%).
- On July 1, 2013, according to preliminary estimates, there were 6,900 centenarians in Canada, representing almost 20 centenarians per 100,000 persons. In 2001, this proportion was two times lower, at 11 centenarians per 100,000 persons.

- As of July 1, 2013, Newfoundland and Labrador had the highest median age in the country at 44.2 years and Nova Scotia posted the highest proportion of seniors (17.7%).
- Although it is also ageing, the youngest population was in Nunavut, where the median age was 25.4 years and 30.8% of the population was under the age of 15.
- Among the provinces, Alberta posted the lowest median age (36.0 years) and the smallest proportion of seniors (11.2%).

Section 1

Total demographic estimates

This section presents mainly preliminary population estimates for Canada, provinces and territories on July 1, 2013, along with a detailed analysis of components of population growth. It is worthwhile mentioning that population estimates released today are now based on the 2011 Census counts adjusted¹ for coverage. Therefore, a brief analysis on the impact of this rebasing and on intercensal growth over the last two cycles is included. Finally, an historical analysis of population shares of provinces and territories over the last 30 years is also presented.

1.1 National portrait

1.1.1 Population and growth

On July 1, 2013, Canada's population was estimated at 35,158,300, up 404,000 or 1.2%² over the last year (2012/2013). This increase was equal to the one observed in the previous year (2011/2012) and similar to the average increase for the last 30 years (+1.1%). Except for the period between 1986 and 1990, the overall population growth rate has shown little variation in 30 years, ranging between 0.8% and 1.2%.

1. In this case, the adjustment for census net undercoverage also includes the incompletely enumerated Indian reserves.
2. Rates are based on the average population over the period.

Chart 1.1
Demographic growth rate, 1982/1983 to 2012/2013, Canada

1.1.2 Rebasing (2011)

The estimates released in this publication are now based on the 2011 Census adjusted for census net undercoverage and partially enumerated Indian reserves. Population estimates between July 1, 2006 and July 1, 2011 have become intercensal. The postcensal estimates on July 1, 2011 have been revised and lowered by 171,115, for an error of closure of 0.50%. This error is higher than the level recorded in 2001 (0.16%) and 2006 (0.14%).

The error of closure is a measure of accuracy of the postcensal estimates. It is defined as the difference between the final postcensal estimate on Census day and the census population adjusted for coverage. There are two main sources for this error: errors primarily due to sampling when measuring census coverage and errors related to components of population growth during the intercensal period.

1.1.3 Intercensal growth

On July 1, 2011, the estimated population of Canada based on the 2011 Census was 34,342,800. At the national level, intercensal population growth between the 2006 and 2011 censuses was 5.3%, or 1.8 million people. This growth was higher than the level observed

in the previous intercensal period 2001/2006 with 4.9%. Between 2006 and 2011, net international migration accounted for two-thirds of Canada's population growth.

Between 2006 and 2011, Canada's population growth rate (+5.3%) was the highest among the G8³ countries for a comparable period, including the United States (+3.4%), the United Kingdom (+3.4%), Italy (+3.1%), France (+2.8%), Japan (+0.1%), Russia (+0.1%) and Germany (-0.8%). Among industrialized countries, Canada's current population growth fell below the estimated rates for countries such as Luxemburg (+8.7%), Ireland (+7.8%) and Australia (+7.6%).

In general, population growth in the provinces and territories between 2006 and 2011 was greater than the level observed in the period between 2001 and 2006, except in Ontario, Alberta and the Northwest Territories. In addition, the population in all the provinces and territories increased between 2006 and 2011. In contrary, three provinces, Newfoundland and Labrador, New Brunswick and Saskatchewan, saw a decline in their populations between 2001 and 2006.

3. The G8, or the 'Group of 8,' is an informal discussion group and economic partnership consisting of eight of the world's most powerful economies: the United States, Japan, Germany, France, United Kingdom, Italy, Canada and Russia. Sources: Eurostat et US Census Bureau for similar periods.

Chart 1.2

Intercensal demographic growth, 2001/2006 and 2006/2011, Canada, provinces and territories

For the 2006/2011 intercensal period, population growth was low in the Atlantic provinces, but high in the Western provinces and the territories. Compared with the national rate (+5.3%), growth was stronger in Nunavut (+10.4%), Alberta (+10.2%), Yukon (+9.3%), Saskatchewan (+7.2%) and British Columbia (+5.9%). In contrast, the population grew more slowly in the Northwest Territories (+0.7%), Nova Scotia (+0.7%) and New Brunswick (1.3%).

1.1.4 Evolution of population share of provinces and territories

In the last 30 years, the populations of the Prairie provinces and British Columbia have

grown substantially (+39.5%), while the Atlantic provinces have seen their populations increased only slightly (+3.5%). By comparison, Canada's population increased by 32.4% during this period. Since 1983, the population share of the Western provinces has increased by 2.2 percentage points, reaching 31.2% on July 1, 2013, compared with a decrease of 2.3 percentage points for the Atlantic provinces for which the population share stands at 6.7%. In turn, the population of Ontario grew about twice as rapidly (+39.8%) as that of Quebec (+21.0%) during this period. Among the provinces, Alberta has recorded the strongest growth since 1983, with an increase of 50.8%. Population growth in the territories was 43.5% for the same period.

Atlantic	2,287,397	9.0	2,368,778	6.7	3.5
Western	7,362,090	29.0	10,980,370	31.2	39.5
Territories	74,424	0.3	115,828	0.3	43.5

1. Before 1991, only combined estimates of Northwest Territories and Nunavut are available.

2. For the calculation, the population of Nunavut and Northwest Territories has been used for 2013.

Provincial differences in the intensity of the population growth in the past 30 years can be attributed to several factors. For example, interprovincial migration was often more favourable to the Western provinces and less favourable to the Atlantic provinces. Natural increase was generally higher in the Prairie provinces and the territories and lower in the Atlantic provinces. Finally, a greater influx of international migrants was observed in Ontario and British Columbia.

On July 1, 2013, it was estimated that three-quarters of Canadians were living in three provinces: Ontario (38.5%), Quebec (23.2%) and British Columbia (13.0%). Among the provinces, Ontario was still the province with the largest population with 13.5 million people while Prince Edward Island was the smallest with 145,000 people. With close to 8.2 million people, Quebec ranked second in terms of population, followed by British-Columbia with 4.6 million and

Alberta, which surpassed 4 million in 2013. Among the territories, estimated population was 35,600 in Nunavut, 36,700 in Yukon and 43,500 in Northwest Territories on July 1, 2013.

1.1.5 Regional profile, 2012/2013

1.1.6 Differential growth of provinces and territories

Population growth can vary greatly among Canada's provinces and territories. Preliminary estimates⁴ for 2012/2013 indicate that population growth was low⁵ in the Atlantic provinces, even negative in Nova Scotia (-0.5%), and in general high in the Western provinces. Growth exceeded the national level (+1.2%) in Alberta (+3.4%), Nunavut (+2.5%) and Saskatchewan (+1.9%).

4. Preliminary postcensal estimates are subject to revision. Future updates could affect this analysis.

5. A rate higher than -0.1 % and lower than 0.1 % is, for the rest of the analysis, considered being neutral or low.

Chart 1.3
Demographic growth rate, 2011/2012 and 2012/2013, Canada, provinces and territories

Record levels of net international migration and net interprovincial migration to the province explain this growth in Alberta. In the Atlantic provinces, low growth was mainly explained by a low natural increase and a six-year high losses due to interprovincial migration. Compared with 2011/2012, population growth in 2012/2013 steeply declined in Yukon, Prince Edward Island and Nova Scotia. Conversely, growth accelerated in Alberta and Nunavut.

1.1.7 Factors of demographic growth

At the national level, population growth is the result of two factors: natural increase and net international migration. Natural increase is the difference between

the number of births and deaths. Net international migration basically refers to the number of moves between Canada and abroad, accompanied by a change in usual place of residence; it consists of the following components: immigration, emigration, returning emigrants, net temporary emigration and net non-permanent residents.

International migration is gaining in importance as an engine of Canada's population growth, and since 1993 it has consistently been the main source of that growth.⁶ In 2012/2013, net international migration was responsible for two-thirds (67.7%) of population growth in Canada. By comparison, net international migration⁷ accounted on average for one-third (36.2%) of population growth between 1982/1983 and 1992/1993. For the year ending June 30, 2013, net international migration was estimated at 273,400, more than double the figure for natural increase (+130,600).

6. For intercensal periods, total growth is not only made of natural increase and net international migration. It also includes residual deviation which is the difference between population growth calculated using censal estimates of population between two dates and that obtained by the sum of the component of growth for the same period.

7. Including residual deviation.

Chart 1.4
Factors of demographic growth, 1982/1983 to 2012/2013, Canada

1.1.8 Natural increase

According to preliminary data, natural increase for the year ending June 30, 2013 was estimated at 130,600, down from 134,100 in the previous year. In 2012/2013, natural increase resulted from the difference between 383,800 births and 253,200 deaths estimated for that year. The number of persons who were added by natural increase in 2012/2013 declined by approximately 3,500 compared with 2011/2012. This is due to the fact that deaths increased more rapidly than births during this period.

The rate of natural increase was 0.4% in 2012/2013, similar to the level observed since 2005/2006. Overall, natural increase was low in the Atlantic provinces and much higher in the territories. For the first time, a province has registered a negative natural growth rate (-0.1%), namely, Newfoundland and Labrador. Nunavut recorded the strongest natural increase (+1.9%) in Canada while Alberta had the strongest (+0.8%) among provinces. Indeed, Alberta has held this title continuously since 1980/1981.

1.1.9 Births

For the year ending June 30, 2013, the estimated number of births was 383,800 in Canada, a slight increase from the previous year (378,800). In 2012/2013, the crude birth rate, which is the ratio between births and the average population during the period, was estimated at 1.1%. In the past year, these rates were higher in the territories and lower in the Atlantic provinces. The highest birth rate was observed in Nunavut (+2.4%), while among the provinces, Alberta and Saskatchewan led the way (+1.4%), closely followed by Manitoba (+1.3%). Birth rates of these areas were fuelled by strong fertility rates, as illustrated by the latest total fertility rates (TFR).⁸ For a detailed analysis of demographic growth for all components, please refer to the *Report on the Demographic Situation in Canada*⁹ (Catalogue no. 91-209-X).

8. <http://www.statcan.gc.ca/pub/91-209-x/2013001/article/11784-fra.htm>.

9. <http://www.statcan.gc.ca/pub/91-209-x/91-209-x2013001-fra.htm>.

1.1.10 Deaths

For the year ending June 30, 2013, the estimated number of deaths was 253,200 in Canada, a slight increase from last year (244,600). This increase in the number of deaths is mainly explained by demographic growth but is also related to population ageing. This means that a greater share of the population is in the older age groups and is then exposed to a higher level of mortality.

In 2012/2013, the crude mortality rate, namely, the ratio between deaths and the average population during the period was estimated at 0.7% in Canada. Rates were lower in the territories and higher in the Atlantic provinces. Compared with 2011/2012, the number of deaths was higher in all provinces and territories. In Canada, the highest mortality rates were observed in all the Atlantic provinces (+0.9%) and in Saskatchewan (+0.9%) while the Northwest Territories (+0.4%) had the lowest rates. Among the provinces, in 2012/2013 Alberta once again registered the lowest mortality rate in Canada (+0.6%), for a 32nd consecutive year. This is related to the fact that Alberta has the youngest population of any province.

1.1.11 International migration

Net international migration was estimated at 273,400 for the year ending June 30, 2013, down from the previous year (+277,400). The net international migration rate reached 0.8% in 2012/2013, a similar level observed in the previous year. In 2012/2013, the net international migration rate was above the national average in three provinces: Alberta (+1.3%), Saskatchewan (+1.2%) and Manitoba (+1.1%).

1.1.12 Immigrants

Nearly 263,000 immigrants took up residence in Canada in the year ending June 30, 2013, a number exceeding 250,000 for a fourth year in a row and higher than in 2011/2012 (+260,100). In 2012/2013, the immigration rate was estimated at 0.8% in Canada. Among the provinces and territories, the highest immigration rates were seen in Manitoba (+1.0%), Saskatchewan (+0.9%) and Alberta (+0.9%).

In recent decades, the regional distribution of immigration in Canada has changed. In 2012/2013,

Ontario continued to be the Canadian province receiving the most immigrants. However, this trend has tended to diminish in the last few years. On average between 1982/1983 and 2007/2008, Ontario welcomed between 44.3% and 59.6% of all immigrants coming to Canada. In 2012/2013, only 40.2% of Canada's immigrants settled in that province. This was its second lowest proportion since 1971/1972, which is the first year covered by the current demographic accounting system.

Compared with 2011/2012, more immigrants settled in Ontario (+4,500), Alberta (+2,300) and Québec (+1,700) in 2012/2013. Lastly, two provinces in 2012/2013 received a record number of immigrants: Quebec (+56,000) and Alberta (+36,800). Saskatchewan welcomed its second highest number of immigrants (+9,800).

1.1.13 Net non-permanent residents

Net non-permanent residents represent the change in the number of non-permanent residents between two dates. For the year ending June 30, 2013, net non-permanent residents stood at +49,300, down 11.9% from the level (+56,000) observed in 2011/2012. Net non-permanent residents were positive in 2012/2013 in all provinces. The highest number of net non-permanent residents was observed in Alberta with +19,600, followed by British-Columbia with +11,500 and Ontario with +7,500. And lastly, net non-permanent residents stood at record levels for two provinces: Manitoba (+1,900) and Saskatchewan (+3,900).

1.1.14 Emigration, returning emigration and net temporary emigration

Preliminary estimates indicate that in 2012/2013, 57,100 Canadians emigrated, 36,600 emigrants returned to Canada on a permanent basis and net temporary emigration stood at 18,400. Based on these three components, net emigration¹⁰ can therefore be estimated at nearly 38,900 for the year ending June 30, 2013. Net emigration was concentrated in three provinces, Ontario (+14,700), British Columbia (+12,000) and Quebec (+9,200). The net emigration

10. Net emigration is obtained as follows: difference between emigration and returning emigration to which is added net temporary emigration.

rate was above the national average (0.1%) only in British Columbia (0.3%).

1.1.15 Interprovincial migration

At the provincial and territorial level, population growth results not only from natural increase and net international migration, but also from net interprovincial migration. This is the change in the size of a population during a given period as a result of population movements between Canada's provinces and territories, accompanied by a change in usual place of residence.

For the year ending June 30, 2013, net interprovincial migration was positive for only two provinces:

Alberta (+52,700 or 1.3%) and Saskatchewan (+1,800 or 0.2%). In 2012/13, Alberta was the only province for which net interprovincial migration has increased compared with 2011/2012. Alberta mainly benefited from migratory exchanges with certain provinces, with net gains of +22,400 from Ontario, +11,200 from British Columbia, +4,900 from Nova Scotia and +4,200 from Quebec.

In 2012/2013, most interprovincial in-migrants to Quebec were from Ontario (64.2%) and most interprovincial out-migrants from British Columbia went to Alberta (56.9%). Finally, net interprovincial migration was at a 6-year low in the Atlantic provinces and Manitoba, a 5-year low in Quebec, an 11-year low in British Columbia and a 32-year low in Ontario.

Section 2

Population by age and sex

This section analyzes estimates of the population by age and sex for Canada, the provinces and territories on July 1, 2013.

2.1 National portrait

2.1.1 Population aging

In recent decades, one of the main changes related to Canada's age and sex structure is population aging.

The following age-sex pyramid (Figure 2.1) illustrates the aging of Canada's population by comparing the age and sex structure of the Canadian population on July 1, 1983 and 2013. In particular, the pyramid shows the impact of the large cohort of baby boomers, born between 1946 and 1965, on Canada's age structure. The movement of the baby boomers through the age structure is especially apparent in this age-sex pyramid. Thirty years ago, the baby boomers were young adults in the 18 to 37 age range, whereas now they are in the 48 to 67 age range.

Figure 2.1

Age pyramid of population estimates as of July 1, 1983 and 2013, Canada

According to preliminary estimates, 5,379,600 Canadians, that is around one person out of six (15.3%), were aged 65 and over on July 1, 2013. This proportion is steadily increasing since the middle of the 1960s because of fertility rates persistently below the replacement level and an increasing life expectancy. By comparison, the proportion of Canadians aged 65 and over was 9.9% on July 1, 1983, that is 30 years earlier. The growth of this segment of the population has accelerated over the last 2 years, with annual growth above 4.0% compared to growth

ranging between 2.5% and 3.2% since 2005. Over the coming years, this proportion should continue to rise rapidly as an increasing number of baby boomers will reach the age of 65.

At the international level¹, the proportion of seniors in Canada remains below the proportions registered in Japan (25.0%), Germany (21.0%), France (17.0%) and the United Kingdom (16.0%). However, it is slightly

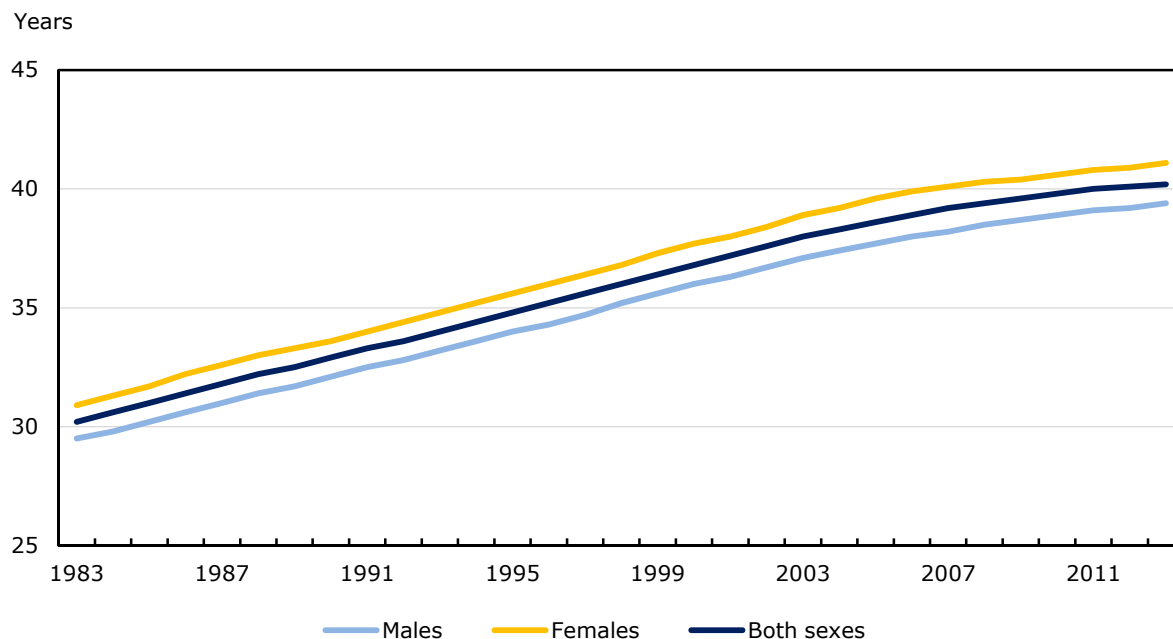

1. 2013 World Population Data Sheet, Population Reference Bureau.
http://www.prb.org/pdf13/2013-population-data-sheet_eng.pdf. Page visited on November 3, 2013.

higher than those recorded in Australia (14.0%) and the United States (14.0%).

In 2013, one Canadian in two is at least 40 years of age. The median age of Canada's population has grown by 10 years in the past 30 years (see Chart

2. Life Tables, Canada, Provinces and Territories 2009 to 2011.
<http://www.statcan.gc.ca/pub/84-537-x/84-537-x2013005-eng.htm>. Page visited on November 3, 2013.

Chart 2.1
Median age by gender, 1983 to 2013, Canada

As of July 1, 2013, the number of children aged 14 and under was estimated at 5,674,100. They represented 16.1% of the total population, down from 21.8% on July 1, 1983. The number of children (population aged less than 15) still remains higher than the number of seniors (population aged 65 and over) but the gap between the two groups is decreasing. Between 1983 and 2013, the number of seniors more than doubled (115.3%), while the number of children slightly increased (2.7%). Thus, on July 1, 2013, the number of children surpassed that of seniors by 294,500 compared to a difference of over 3.0 million at the same date in 1983. The aging of the population in Canada is bound to accelerate in the coming years, as all members of the vast baby-boom cohort reach age 65. At that point, the proportion of persons aged 65 and over will exceed the proportion of children under 15 years of age. The most recent

2.1). On July 1, 2013, the median age of the Canadian population was 40.2 years. The median age is higher for women (41.1 years) than for men (39.4 years). This difference is explained by a persistent, although diminishing, gap in life expectancy in favour of females. The most recent data show that females' life expectancy was 83.6 years, compared with 79.3 years for males².

projections show that seniors could account for more than one-quarter of the population by 2036³.

Population aging does not affect all parts of the country in the same way. On July 1, 2013, the youngest populations in Canada generally resided in the territories, while the oldest lived in the Atlantic provinces. Newfoundland and Labrador was the place in Canada with the oldest population (44.2 years). Among the provinces, Alberta had the youngest population (36.0 years). Owing to higher fertility and lower life expectancy, Nunavut had the youngest population in Canada, with a median age of 25.4 years in 2013.

3. Population Projections for Canada, Provinces and Territories, 2009-2036, medium-growth scenario (M1), Catalogue no.91-520-X.

2.1.2 Five-year age group

All age groups over 40 posted higher growths than the national average between 1983 and 2013, suggesting that the ageing of the population is bound to accelerate in the coming years. The largest increases happened in age groups aged 80 and over⁴. Between 1983 and 2013, the age group showing the largest increase (+108.6%) was the 85 and over group (Chart 2.2), going from 207,900 in 1983 to 702,000 in 2013. Following them was the population between 80 and 84 years of age (+89.3%). Five other age groups saw their numbers increasing at a notably high rate over the last 30 years: the 50 to 54 (+74.2%),

the 55 to 59 (+70.2%), the 45 to 49 (+68.1%), the 65 to 69 (+67.7%) and the 75 to 79 (+67.7%). Except for the 75 to 79, the strong increase in the size of these age groups is due to the presence of baby boomers, who comprise the largest cohorts in the history of Canada. From 1983 to 2013, three age groups saw their numbers decrease: the 20 to 24 (-2.4%), the 10 to 14 (-1.1%) and the 15 to 19 (-0.6%). These cohorts were born between 1989 and 2003, a period in which Canadian fertility was at its lowest levels, reaching a low of 1.49 children per woman at the turn of the 21st century⁵.

5. Crude birth rate, age-specific and total fertility rates (live births), Canada, provinces and territories. CANSIM table 102-4505. Page visited on November 3, 2013.

4. Data on centenarians are only available since 2001.

Chart 2.2

Demographic growth rate by age group between 1983 and 2013, Canada

2.1.3 Sex ratio

Aside from aging, the sex structure of the population is also changing (Chart 2.3). On July 1, 2013, in the Canadian population as a whole, there were an estimated 98 males per 100 females compared to 99 males per 100 females in 1983. Males outnumbered females in the 0 to 14 and 15 to 39 age ranges, owing to the sex ratio at birth, which

averages 105 males per 100 females. However, when people reach the middle of their fifties, the numbers of males start to fall slightly below the numbers of females, because of a higher male mortality rate. This gap widens at more advanced ages, with the result that among persons aged 65 to 79, there were estimated to be 91 males per 100 females on July 1, 2013. This is nevertheless an increase compared with 1983, when for 100 females there were only 79 males.

In the population aged 80 and over, there were an estimated 61 males per 100 females on July 1, 2013, compared with only 54 per 100 on July 1, 1983. Among

centenarians, in 2013, there were only 13 males left per 100 females.

Chart 2.3

Sex ratio by age group, 1983 and 2013, Canada

2.1.4 Children (under 15 years of age)

The proportion of children within the population continues to decline. On July 1, 2013, there were an estimated 5,674,100 children aged 0 to 14 in Canada, representing 16.1% of the total population. They accounted for 21.8% of the population in 1983. The most recent population projections show that the proportion of children aged 0 to 14 years could fall below 16.0% during the 2030s. They also show that between 2015 and 2021, the number of children will be surpassed by the number of seniors. The proportion of children varies from one part of Canada to another, peaking at the national level in Nunavut (30.8%) and, among the provinces, in Saskatchewan (18.8%) and Manitoba (18.7%).

The recent rise in fertility has slightly increased the proportion of children under five years of age in the population. As a result, on July 1, 2013, they constituted 5.5% of the Canadian population, up slightly from the historic low reached in 2005 (5.3%). However, children under five are still proportionally less

numerous than in 1983, when they comprised 7.2% of the total population.

2.1.5 Working-age population (15 to 64 years of age)

On July 1, 2013, the number of persons aged 15 to 64 was estimated at 24,104,600 or 68.6% of the Canadian population. This proportion is 0.2 percentage points higher than in 1983. According to the most recent population projections, the proportion of the population that is of working age could gradually decline to 60% by the early 2030s, when the baby boomers will all have crossed the age 65 threshold. The proportion of persons of working age varies from one part of Canada to another, reaching its highest levels at the national scale in Yukon (73.4%) and, among the provinces, in Alberta (70.6%) and British Columbia (68.8%).

The working-age population can be divided into two groups: the younger segment (aged 15 to 39) and the

older segment (aged 40 to 64). On July 1, 2013, the younger segment comprised 48.9% of the working-age population. On the other hand, the older segment of the working-age population has exceeded the younger segment since 2005. In 1983, the younger segment of the working-age population comprised 63.8% of the population aged 15 to 64.

2.1.6 Senior population (65 years and over)

The population aged 65 and over continues to grow. On July 1, 2013, the roughly 5,379,600 people aged 65 and over comprised 15.3% of the Canadian population (see

Chart 2.4

Proportion of population aged less than 15 years old and 65 years old and over, 1983 to 2036, Canada

Note: From 1983 to 2013, population estimates. From 2014 to 2036, Population Projections for Canada, Provinces and Territories, 2009-2036, medium-growth scenario (M1), Catalogue no. 91-520-X.

2.1.7 Very elderly population (80 years and over)

Having grown steadily, the population aged 80 and over was estimated at 1,430,200 on July 1, 2013. In 2013, this population comprised 4.1% of the Canadian population, compared with 1.9% in 1983. Demographic projections indicate that in 2036, 7.6% of Canadians could be 80 years of age or older.

Chart 2.4). In 1983, seniors comprised 9.9% of the population. The aging of the population in Canada is expected to accelerate between 2013 and 2031, when all of the vast cohort of baby boomers will have reached age 65.

The proportion of persons aged 65 and over differs from one part of Canada to another, ranging from 3.5% in Nunavut to 17.7% in Nova Scotia. The most recent projections show that by 2036, seniors could constitute more than one-fourth of the population. According to these same projections, seniors could outnumber children beginning in 2017.

Also, persons aged 80 or over account for an increasing share of the population aged 65 and over. On July 1, 2013, 26.6% of the population aged 65 and over was aged 80 and over. This proportion was estimated at 19.5% in 1983 but could reach 32.0% toward 2036.

2.1.8 Centenarian population (100 years and over)

Due to increasing life expectancy, more and more Canadians reach the age of 100. On July 1, 2013, according to preliminary estimates, there were 6,900 centenarians in Canada, representing almost 20 centenarians per 100,000 persons. In 2001, this proportion was two times lower, at 11 centenarians per 100,000 persons. By comparison, in 2012, Japan's population was comprised of around 40 centenarians per 100,000 persons⁶. More women than men reach the age of 100 because of lower mortality levels at all ages. In 2013, centenarians were mostly women (87.1%).

1. Preliminary postcensal estimates.

Note(s): Figures in percent may not add up to 100% as a result of rounding.

Not only do the Atlantic provinces have older populations, but those populations have aged more rapidly in the past 30 years (Chart 2.5). This is a trend that goes back a number of years; it is attributable to regional differences in demographic behaviours, in particular the change over time in fertility, which was first higher, then lower than the national average, and substantial losses with respect to interprovincial migration.

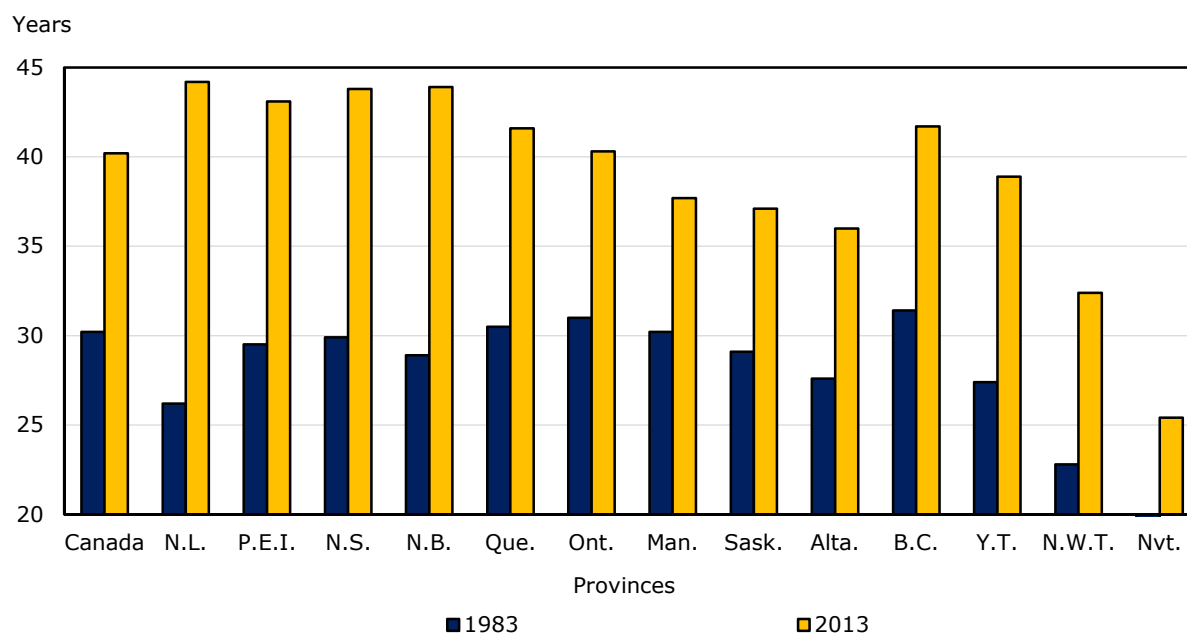

2.2 Portrait of provinces and territories

2.2.1 Population aging

The age structure of the population can change a lot from one province or territory to the other. These differences are more often due to differences in the levels of fertility and immigration, and to changes in interprovincial migration. On July 1, 2013, Canada's younger populations were found in the territories and in the Prairies, and the older populations in the Atlantic provinces (Table 2.1). The youngest populations in Canada were found in Nunavut (25.4 years) and the Northwest Territories (32.4 years), owing to higher fertility and lower life expectancy.

In 1983, the provinces and territories had a very different demographic profile with regard to population aging. The provinces whose populations had the highest median ages were British Columbia (31.4 years), Ontario (31.0 years), Quebec (30.5 years) and Manitoba (30.2 years). On the other hand, the province with the lowest median age was Newfoundland and Labrador (26.2 years).

Chart 2.5
Median age, 1983 and 2013, Canada, provinces and territories

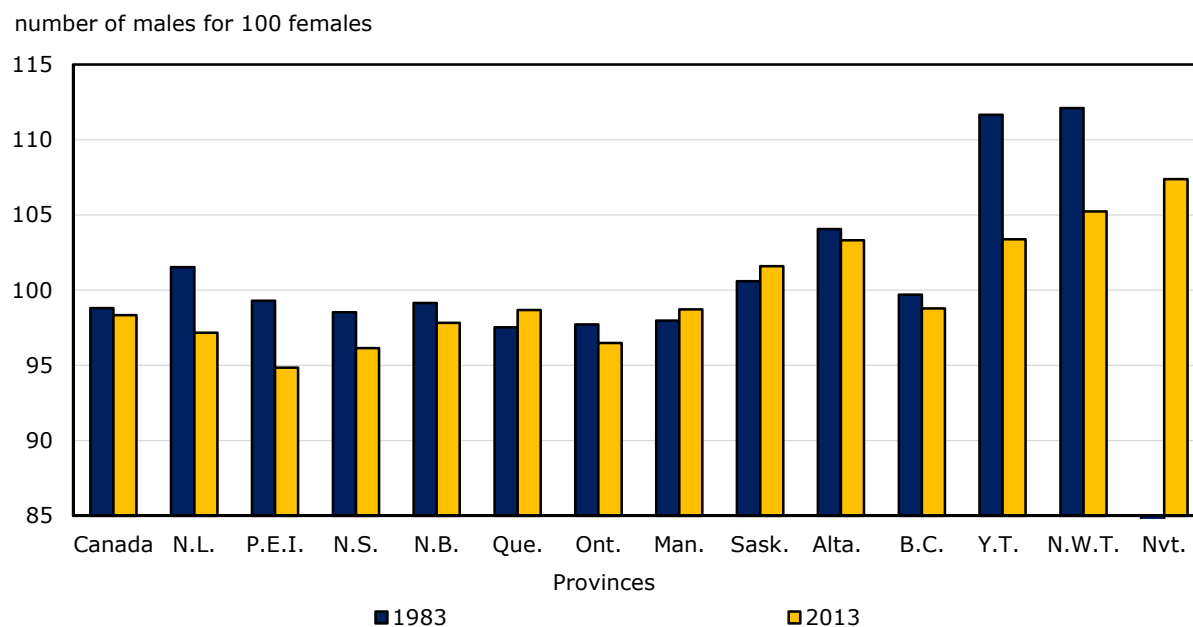

Note: In 1983, Nunavut was included in the Northwest Territories.

2.2.2 Sex ratio

The populations of the provinces and territories differ not only in their age structure but also in their sex structure (Chart 2.6). In 1983, the places

with the highest sex ratios were the two territories: Yukon and the Northwest Territories, with 112 males per 100 females, and among the provinces, Alberta, with 104 males per 100 females.

Chart 2.6
Sex ratio, 1983 and 2013, Canada, provinces and territories

Note: In 1983, Nunavut was included in the Northwest Territories.

Since 1983, the sex structure of the populations of the provinces and territories has changed, in part because of the population aging process. The proportion of males has declined throughout Canada except in Quebec, Manitoba and Saskatchewan. On July 1, 2013, it was once again the territories and Alberta that posted the highest sex ratios in Canada. Nunavut ranked first with 107 males per 100 females, followed by the Northwest Territories (105); these are both places with high fertility and a young population. Among the provinces, Alberta had the highest sex ratio (103), mainly because it too has a younger population; males outnumber females in the youngest populations. Finally, Prince Edward Island (95) and Nova Scotia (96) were the provinces with the lowest sex ratio on July 1, 2013.

2.3 Provincial and territorial variations

2.3.1 Newfoundland and Labrador

On July 1, 2013, 17.1% of the population of Newfoundland and Labrador was aged 65 and

over. Its median age, estimated at 44.2 years, was the highest in Canada. In the past 30 years, this province's median age has risen by 18.0 years, the largest increase in Canada. Thus, Newfoundland and Labrador has gone from being the province with the lowest median age in 1983 to the one with the highest median age. This province combines low fertility with substantial migratory losses, two factors that contribute to population aging.

2.3.2 Prince Edward Island

The median age of Prince Edward Island's population stood at 43.1 years on July 1, 2013, while the proportion of its population that was aged 65 and over was estimated at 17.3%. Among the Atlantic provinces, Prince Edward Island had the lowest median age. Also, 15.8% of the province's population was under 15 years of age, the highest proportion in the Atlantic region. Prince Edward Island is the province with the highest fertility in that region.

2.3.3 Nova Scotia

Nova Scotia had one of the oldest populations in Canada. The share of its population that was aged 65 and over was estimated at 17.7%, the highest of the country. Also, its median age was 43.8 years, the third highest figure after Newfoundland and Labrador and New Brunswick. This situation is due both to lower fertility and to interprovincial migratory losses for many years.

2.3.4 New Brunswick

On July 1, 2013, 17.6% of the population of New Brunswick was aged 65 and over, the second highest figure in Canada. Its median age was estimated at 43.9 years, up 15.0 years since 1983. Like the other Atlantic provinces, New Brunswick has a fertility rate below the national average and losses in its migratory exchanges with the rest of Canada.

2.3.5 Quebec

The population of Quebec was slightly older than that of Canada as a whole. On July 1, 2013, 16.6% of this province's population was aged 65 and over, the highest figures west of the Atlantic provinces, while its median age was 41.6 years. This province's median age has risen by 11.1 years since 1983, an increase slightly higher than for Canada as a whole. Quebec has continual interprovincial migration losses and a fertility rate that until recently was below the national average.

2.3.6 Ontario

On July 1, 2013, the median age of the population of Ontario was 40.3 years, while the proportion of the population aged 65 and over was 15.2%. Since 1983, this province's median age has risen by 9.3 years, an increase slightly lower than for Canada as a whole. However, since 2006, due to losses in interprovincial migration, the median age of Ontario's population increased by 1.9 years compared to 1.3 for Canada as a whole.

2.3.7 Manitoba

On July 1, 2013, 14.4% of the population of Manitoba was aged 65 and over and its median age was estimated at 37.7 years. On the other hand, 18.7% of this province's population was 0 to 14 years of age, the highest proportion for a province after Saskatchewan. Manitoba has had the lowest median age since 1983 (7.5 years) because of a fertility rate above the national average.

2.3.8 Saskatchewan

On July 1, 2013, Saskatchewan had the largest proportion of persons aged 0 to 14 of any province (18.8%). Also, 14.4% of this province's population was aged 65 and over and its median age was estimated at 37.1 years. The median age in Saskatchewan was down 0.2 years from the previous year. This situation is due to having the highest fertility of all the provinces and net international migration that has increased substantially in the past few years.

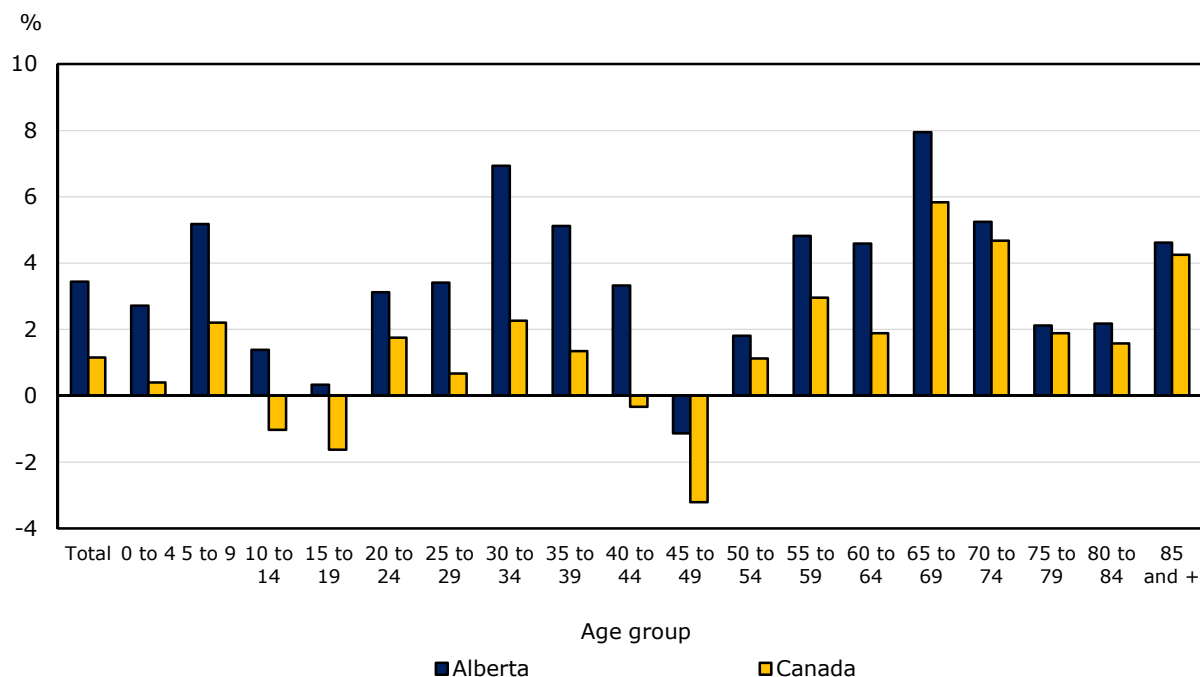

2.3.9 Alberta

Among the provinces, Alberta had the youngest population on July 1, 2013. Its median age was 36.0 years, while its proportion of persons aged 65 years and over was estimated at 11.2%, with both these figures being the smallest for any province. Moreover, Alberta had the highest proportion of working-age persons of any province (70.6%). Alberta is characterized by high fertility and major gains from interprovincial and international migration.

During the year 2012/2013, Alberta distinguished itself from the other provinces with a demographic growth almost three times higher than the national average. This increase was strongest among the population aged 30 to 44 years, for men and women. The growth of Alberta's population at these ages was 5.2% compared to 1.1% nationally. This was mostly due to Alberta's significant gains in interprovincial and international migration that were concentrated in large part at these ages.

Chart 2.7

Demographic growth rate by age group between 2012 and 2013, Alberta and Canada

The favourable economic context of Alberta can explain in large part this province's important gains in international and interprovincial migration, which contributed to the working-age population growth. The oil and gas industry has led Alberta's economic growth and job creation, which has translated into a marked increase in the demand for workers. In 2012/2013, Alberta's employment and job vacancy rates were among the highest in the country⁷. The continued economic boom has also generated growth in a number of energy related sectors, service industries and other sectors of the economy in Alberta.

2.3.10 British Columbia

On July 1, 2013, the median age of British Columbia's population was 41.7 years, while the proportion of persons aged 65 and over was estimated at 16.4%, with both these figures being the highest west of Quebec. This situation is due to lower fertility and longer life expectancy.

2.3.11 Yukon

On July 1, 2013, Yukon was the place in Canada with the largest proportion of working-age persons (73.4%). This territory also had highest median age (38.9 years) and the largest proportion of persons aged 65 and over (9.9%) of the three territories. Yukon stands out from the other two territories in that its fertility rate is closer to the national average.

2.3.12 Northwest Territories

The Northwest Territories had the youngest population after Nunavut. Approximately one person in five (21.1%) living in this territory was under 15 years of age, while only six persons in 100 (6.1%) were aged 65 and over. The median age of the Northwest Territories population was estimated at 32.4 years. This territory has a fertility rate much higher than the national average, surpassed only by that of Nunavut.

2.3.13 Nunavut

Nunavut has the youngest population in Canada. The median age of Nunavut's population (25.4 years) and its proportion of persons aged 65 and over (3.5%) are by far the lowest in Canada. Furthermore, 30.8% of the population of Nunavut is under 15 years of age, a proportion almost twice the national average. Nunavut has the highest fertility in Canada, approximately two times higher than the national average. In addition, this territory posts the lowest life expectancy of the country.

30 to 34 years	1,426	1,324	826
35 to 39 years	1,047	1,222	1,126
40 to 44 years	3,550	2,808	-450
45 to 49 years	524	1,668	5,155
50 to 54 years	1,463	517	-480
55 to 59 years	2,258	2,718	2,761
60 to 64 years	301	269	910
65 to 69 years	70	496	690
70 to 74 years	-164	-578	-1,417
75 to 79 years	-93	14	308
80 to 84 years	765	488	125
85 to 89 years	1,064	1,080	1,396
90 to 94 years	64	468	169
95 to 99 years	206	9	-598
100 years and over	101	170	149

1. Period from July 1 to June 30.

Note(s): Residual deviation represents the difference between demographic population growth calculated using intercensal estimates of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution (based on the number of days) of the error of closure between years within the quinquennial period.

Methodology

This document describes the concepts, data sources and methodology used to produce the population estimates. Population estimates are produced to measure the population counts according to various characteristics and geographies between two censuses. The demographic estimates are the official population estimates at the national, provincial and territorial levels.

Postcensal estimates are based on the 2011 Census.

Specific information regarding age and sex distributions is provided in boxes.

Population Estimates

Estimates of the total population

Types of estimates

Population estimates can be either intercensal or postcensal. Intercensal estimates are produced using counts from two consecutive censuses adjusted for census net undercoverage (CNU)¹ and postcensal estimates. The production of intercensal estimates involves updating the postcensal estimates using the counts from a new census adjusted for CNU.¹

Postcensal estimates are produced using data from the most recent census adjusted for CNU¹ and the components of demographic growth. In terms of timeliness, postcensal estimates are more up-to-date than data from the most recent census adjusted for CNU,¹ but as they get farther from the date of that census, they become more variable.

Levels of estimates

Updating population estimates between censuses entails the use of data from administrative files or surveys. The quality of population estimates therefore depends on the availability of a number of administrative data files that are provided to Statistics Canada by Canadian and foreign government departments. Since some components are not available until several months after the reference date, three kinds of postcensal estimates are produced: preliminary postcensal (PP), updated postcensal (PR) and final postcensal (PD). The time lag between the reference date and the release date is three months for preliminary estimates and two to three years for final estimates. Though it requires more vigilance on the part of users, the production of three successive series of postcensal estimates is the strategy that best satisfies the need for both timeliness and accuracy of the estimates. All tables indicate the level of the estimates they contain.

Calculation of postcensal population estimates

Population estimates – preliminary, updated and final – are produced by the component method. This method consists of taking the population figures from the most recent census, adjusted for the CNU¹ (census undercoverage minus census overcoverage), and adding or subtracting the number of births, deaths, and components of international and interprovincial migration.

1. In this case, the adjustment for the census net undercoverage also includes the incompletely enumerated Indian reserves (IEIR).

A. Provincial / territorial estimates of total population

Population estimates are produced for the provinces and territories first; then they are summed to obtain an estimate of the population of Canada.

The component-method formula for estimating the total provincial / territorial populations is as follows:

Figure 2

Component-method formula for estimating total population

$$P_{(t+i)} = P_{(t)} + B_{(t,t+i)} - D_{(t,t+i)} + I_{(t,t+i)} - [E_{(t,t+i)} + \Delta TE_{(t,t+i)}] + RE_{(t,t+i)} + \Delta Ninter_{(t,t+i)} + \Delta N_{(t,t+i)} - Resid_{(t,t+i)}$$

where, for each province and territory:

$(t, t + i)$	=	interval between times t and $t+i$;
$P_{(t+i)}$	=	estimate of the population at time $t+i$;
$P_{(t)}$	=	base population at time t (census adjusted for (CNU) ¹ or most recent estimate);
B	=	number of births;
D	=	number of deaths;
I	=	number of immigrants;
E	=	number of emigrants;
ΔTE	=	net temporary emigration;
RE	=	number of returning emigrants;
ΔNPR	=	net non-permanent residents;
$\Delta Ninter$	=	net interprovincial migration;
$Resid$	=	residual deviation (for intercensal estimates).

B. Provincial / territorial estimates by age and sex

Postcensal population estimates by age and sex are produced by applying the component method to each age-sex cohort in the base population.

At age 0:

Figure 3

Component-method formula for estimating population at age 0

$$P_{(t+1)}^0 = B_{(t,t+1)} - D_{(t,t+1)}^{-1} + I_{(t,t+1)}^{-1} - [E_{(t,t+1)}^{-1} + \Delta TE_{(t,t+1)}^{-1}] + RE_{(t,t+1)}^{-1} + \Delta NPR_{(t,t+1)}^{-1} + \Delta Ninter_{(t,t+1)}^{-1} - Resid_{(t,t+1)}^{-1}$$

From 1 to 99 years:

Figure 4

Component-method formula for estimating population from age 1 to 99

$$P_{(t+1)}^{a+1} = P_{(t)}^a - D_{(t,t+1)}^a + I_{(t,t+1)}^a - [E_{(t,t+1)}^a + \Delta TE_{(t,t+1)}^a] + RE_{(t,t+1)}^a + \Delta NPR_{(t,t+1)}^a + \Delta Ninter_{(t,t+1)}^a - Resid_{(t,t+1)}^a$$

For 100 years and over:

Figure 5

Component-method formula for estimating population at age 100 years and over

$$P_{(t+1)}^{100+} = P_{(t)}^{99+} - D_{(t,t+1)}^{99+} + I_{(t,t+1)}^{99+} - [E_{(t,t+1)}^{99+} + \Delta TE_{(t,t+1)}^{99+}] + RE_{(t,t+1)}^{99+} + \Delta NPR_{(t,t+1)}^{99+} + \Delta Ninter_{(t,t+1)}^{99+} - Resid_{(t,t+1)}^{99+}$$

Figure 6

Legend for all ages

where, for each province and territory:

$(t, t + 1)$	= interval between times t and $t+1$;
a	= age;
$P_{(t+1)}$	= estimate of the population at time $t+1$;
$P_{(t)}$	= base population at time t (census adjusted for (CNU) ¹ , or most recent estimate);
B	= number of births;
D	= number of deaths;
I	= number of immigrants;
E	= number of emigrants;
ΔTE	= net temporary emigration;
RE	= number of returning emigrants;
ΔNPR	= net non-permanent residents;
$\Delta Ninter$	= net interprovincial migration;
$Resid$	= residual deviation (for intercensal estimates).

C. Levels of estimates

The difference between preliminary² and final postcensal population estimates lies in the timeliness of the components. When all the components are preliminary, the population estimate is described as preliminary postcensal (PP). When they are all final, the estimate is referred to as final postcensal (PD). Any other combination of levels is referred to as updated postcensal (PR).

Base population and components of demographic growth

A. Base population

The base populations are derived from the quinquennial censuses between 1971 and 2011. The population universe of the 2011³ Census includes the following groups:

- Canadian citizens (by birth or by naturalization) and immigrants with a usual place of residence in Canada;
- Canadian citizens (by birth or by naturalization) and immigrants who are abroad either on a military base or attached to a diplomatic mission;
- Canadian citizens (by birth or by naturalization) and immigrants at sea or in port aboard merchant vessels under Canadian registry or Canadian government vessels;

2. Unless otherwise noted, the term *preliminary* include both preliminary and updated estimates

3. From 1991 to 2001 Census, "persons with a usual place of residence in Canada who hold Minister's permits (including extensions) and members of their families living with them" were included in the census universe.

- persons with a usual place of residence in Canada who are claiming refugee status and the family members living with them;
- persons with a usual place of residence in Canada who hold study permits and the family members living with them;
- persons with a usual place of residence in Canada who hold work permits and the family members living with them.

For census purposes, the last three groups are referred to as non-permanent residents (NPR). They have been included in the census universe since 1991 but foreign residents are not included. Foreign residents are persons who belong to the following groups:

- government representatives of another country attached to the embassy, high commission or other diplomatic body of that country in Canada, and members of their families living with them;
- members of the Armed Forces of another country who are stationed in Canada, and family members living with them;
- residents of another country visiting Canada temporarily (for example, a foreign visitor on vacation or on business, with or without a visitor's permit).

These base populations are adjusted as follows:

- adjustment of the population for CNU;
- addition of independent estimates for incompletely enumerated Indian reserves in 1991, 1996, 2001, 2006 and 2011;
- adjustment for early enumeration in 1991 and 1996 in parts of Northern Quebec, Newfoundland and Labrador, the Yukon and the Northwest Territories;
- addition of estimates of NPRs in 1971, 1976, 1981 and 1986. Since 1991, NPRs are included in the census universe;
- estimation of the July 1 base population by addition or subtraction of the components of growth between Census Day and June 30;
- demographic adjustment for old age population is an age structure adjustment of censal estimates for 2001, 2006 and 2011 by sex for each province and territory. These adjustments were performed from age 85 in 2001, from age 90 in 2006 and from age 95 in 2011.

Adjustment for the census net undercoverage (CNU)

The adjustment for CNU is important. CNU is the difference between the number of persons who should have been enumerated but were missed (undercoverage) and the number of persons who were enumerated but should not have been or who were counted more than once (overcoverage).

Coverage studies provide undercoverage estimates for the 1991, 1996, 2001, 2006 and 2011 censuses at the provincial and territorial levels, and for the 1971, 1976, 1981 and 1986 censuses at the provincial level only. Estimates of overcoverage at the provincial and territorial levels are available only for the last five censuses (1991, 1996, 2001, 2006 and 2011). Overcoverage for previous censuses was estimated by assuming that the overcoverage-to-undercoverage ratio for each census between 1971 and 1986 was the same as in 1991. The CNU for the Yukon and the Northwest Territories prior to 1991 was estimated by assuming that the ratio between the CNU for each territory and the 10 provinces for each census between 1971 and 1986 was the same as in 1991.

For consistency, the 1991 Census undercoverage and overcoverage were revised in 1998 to take into account the methodological improvements made in the 1996 Census coverage studies. This revision altered CNU in all censuses between 1971 and 1986. Similarly, the 1996 Census undercoverage and overcoverage were revised in 2003.

Various methods were used to produce the estimates of CNU by age and sex for 1991, 1996, 2001, 2006 and 2011. First, the national estimates of CNU based on the coverage studies by age and sex were smoothed. Then an Empirical Bayes regression model was used to generate the provincial and territorial estimates of CNU by broad age groups, and a synthetic model produced estimates by single year of age. Lastly, two-way raking⁴ was used to ensure that CNU estimates were consistent with the provincial and territorial CNU totals and the national estimates by age and sex.

For the 1971 to 1986 period, CNU estimates by age and sex were simply prorated to the revised CNU estimates for the total population.

Demographic adjustment for old age populations

Age structure analysis of recent censuses and population estimates showed that population at old ages, especially centenarians (population aged 100 years old and over), have been subject to overestimation issues. For older populations, the types of errors and the magnitude of their effect can vary from one census to another, from error of misreporting (voluntary and non voluntary) to errors emerging from data capture and processing errors.

When compared to 2011 Census figures, estimates of centenarians still based on 2006 Census were 29% higher for females and 88% higher for males. This indicated that the adjustments done to diminish the 2006 base population for ages 95+, which would make the 100+ population in 2011, were not sufficient. This led the Population Estimates Program (PEP) of Statistics Canada to review its method to adjust the base population's age structure. For example, with these new adjustments, the number of centenarians has been lowered in 2006 for both male and female, respectively from 830 to 595 (-39%) and from 3,891 to 3,784 (-3%).

Using death data and a combination of two methods, the extinct cohort method and the survival ratios method for non-extinct cohorts, the PEP has adjusted the age structure of the 2011 census population in order to overcome the overestimation of population at old ages observed in the 2006 cycle.

Assuming that these populations are not affected by migration, the principle of the extinct cohort method (Vincent, 1951) is simple. When all members of a given cohort have died (up until age 110), the numbers alive in a given year can be calculated by summing the deaths, beginning with the oldest. For non-extinct cohorts, the survival ratio method (Thatcher 1992; Thatcher and al. 2002; Andreev 2004) was used to estimate population in a similar way but under the assumption that deaths of non-extinct cohorts are distributed by age mainly like those who are extinct.

In order to assure coherence of estimates by cohort, the adjustment, name demographic adjustment, was produced to adjust censal estimates for 2001, 2006 and 2011 by age and sex for each province and territory. These adjustments were performed from age 85 in 2001, from age 90 in 2006 and from age 95 in 2011. The surplus populations among the oldest-old population were redistributed in population aged 5 to 74 years according to their relative weights for each province/territory and sex.

The robustness of this newly implemented method will be monitored through the 2011 cycle and researches to improve its fitness and coherence will be continued. A more complete description of the method will be incorporated in the first chapter (base population) of the methodological guide (catalogue no. 91-528-x) in the months to come.

B. Births and deaths

The numbers of births and deaths are derived directly from the vital statistics database of Statistics Canada's Health Statistics Division. Although Statistics Canada manages the National system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting and processing the information from

4. Two-way raking is also referred to as the "Deming method", the "method of iterative proportions", and calibration (see Shryock, Siegel *et al.*, 1976: 547-549).

those administrative files. Under provincial / territorial vital statistics statutes (or similar legislation), all live births and all deaths must be registered, and all provinces and territories provide this information to Statistics Canada.

The vital statistics universe closely parallels the census universe. Both universes include the births and deaths of all Canadians, immigrants and non-permanent residents (NPR) and exclude foreign residents.

Vital statistics by province or territory of residence are used to produce our final estimates of births and deaths.

When there are no vital statistics, the number of births is estimated using fertility rates by the mother's age. The number of deaths is estimated by using mortality rates by age and sex. These methods are used to calculate preliminary² estimates.

Special treatment for preliminary² estimates for Quebec and British Columbia

Quebec and British Columbia provide their most recent estimates of births and deaths. The figures are used to produce preliminary² estimates. For the final estimates, the two provinces' births and deaths are derived from the vital statistics compiled by Health Statistics Division.

With regard to the preliminary² estimates, the number of births by sex is derived by applying an average proportion by sex for each province and territory to the births derived from the birth probabilities. These proportions are calculated using vital statistics from the past 10 years.

With regard to the preliminary² estimates, the number of deaths by age and sex is derived by applying mortality rates by age and sex for each province and territory to the deaths derived from the death probabilities. These mortality rates are calculated using vital statistics from the past 2 years.

Levels of estimates

For information on the differences between preliminary² and final estimates, see sections **B. Births and Deaths**, above.

C. Immigration

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, immigration is regulated by the Immigration and Refugee Protection Act (IRPA) of 2002. This statute superseded the Immigration Act, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes immigrants' administrative files. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. The information is used to estimate the number and characteristics of people granted permanent resident status by the federal government on a given date. For Demography Division, the terms immigrant and permanent resident are equivalent.

An immigrant is a person who is not a Canadian citizen by birth, but has been granted the right to live in Canada permanently by Canadian immigration authorities. The number of immigrants does not include persons born abroad to Canadian parents who are only temporarily outside the country.

Immigrants are usually counted on or after the date on which they are granted permanent resident status or the right to live in Canada.

The number of immigrants by age and sex is derived from the Field Operational Support System (FOSS).

Levels of estimates

The difference between preliminary² and final postcensal estimates lies in the timeliness of the source used to estimate this component. Since the FOSS files are continually being updated, new calculations are carried out each year to update the immigration estimates. Immigration estimates are preliminary the first year and final the following year.

D. Net non-permanent residents

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, the non-permanent residents (NPR) are regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes the administrative files of immigrants and NPRs in Canada. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. The information is used to estimate the number and characteristics of people granted non-permanent resident status by the federal government.

NPRs are persons who are lawfully in Canada on a temporary basis under the authority of a temporary resident permit, along with members of their family living with them. NPRs include foreign workers, foreign students, the humanitarian population and other temporary residents. The humanitarian population includes refugee claimants and temporary residents who are allowed to remain in Canada on humanitarian grounds and are not categorized as either foreign workers or foreign students. For Demography Division, the terms non-permanent resident and temporary resident are equivalent.

NPR estimates are based on the number of NPRs, not on the net. The number of people in CIC's administrative system is estimated on a specific date in each period of observation. First, the end-of-period number of NPR is estimated, and then the start-of-period number of NPR is subtracted from that estimate. That yields the net number of NPR.

Anyone who received non-permanent resident status prior to the observation date is counted. For refugee claimants, the date of their application is used. Permit holders and refugee claimants are excluded from the population if their permit has expired, if they receive permanent resident status, or if they are deported. In addition, refugee claimants are excluded if their file has been inactive for two years.

Since FOSS files are continually being updated, the figures are recalculated each year until the estimates of net NPR are final.

The net number of non-permanent residents by age and sex is derived from the Field Operational Support System (FOSS).

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the source used to estimate this component. Since the FOSS files are continually being updated, the figures are recalculated each year to update the estimates of the net number of NPRs. Non-permanent resident (NPR) estimates are preliminary the first year and updated the following year. They become final two to three years after the reference year, when all other components are also final.

E. Emigration

The number of emigrants is estimated using data from the Office of Immigration Statistics, U.S. Department of Homeland Security, data collected by the Canada child tax benefit (CCTB) program, and data from the T1 Family File (T1FF).⁵ The first source is used to estimate emigration to the United States. CCTB data are used to estimate emigration to other countries. The estimates of the number of child emigrants have to be adjusted because the CCTB is not universal and does not provide direct information on the number of adult emigrants. As a result, four adjustment factors are taken into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of emigrant children based on two versions of the CCTB files;

5. The T1 family file (T1FF) is derived from the Canada Revenue Agency (CRA) T1 file by Income Statistics Division of Statistics Canada.

- the program's partial coverage, that is, people who do not apply for the CCTB or who are not eligible. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FF;⁵
- the differential propensity to emigrate between adults and children. This factor generates the emigration rate for the population aged 18 and over. It is obtained by (1) calculating the average ratio over three years of the adult and child emigration rates based on T1FF⁵ data, (2) calculating the average ratio over three years of the adult and child emigration rates based on data from the Office of Immigration Statistics, U.S. Department of Homeland Security, and (3) taking the average of the two rates. This factor is calculated for Canada only.

The adult emigration rate is applied to the adult population. Adult emigration is distributed by province and territory using data from the T1FF⁵ file. We calculate a ratio of the number of emigrant adults to the number of emigrant children from the T1FF⁵ file. We then apply this ratio to the number of emigrant children from the CCTB by province, which yields the number of adult emigrants whose provincial distribution will differ from that of the children.

The number of adult emigrants combined with the number of child emigrants (once adjusted for the coverage and differential emigration factors) generate the number of emigrants for the entire population.

Emigration is disaggregated by province and territory based on the number of child emigrants adjusted for coverage and differential emigration.

Estimates of the number of emigrants by age and sex are obtained by using the data by five-year age group, sex, province and territory from T1FF⁵ files adjusted for the coverage. We distribute these estimates by single year of age using Sprague coefficients.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

F. Net temporary emigration

Some people leave Canada to live temporarily in another country while others who were temporarily outside of Canada return. The net result of those departures and returns is the component known as "net temporary emigration". Estimates of the number of departures are derived from the Reverse Record Check (RRC), the most important census coverage study. The RRC provides an estimate of the number of people who left Canada temporarily during an intercensal period and are still out of the country at the end of the period. Estimates of the number of returns are based on two sources: the census and Demography Division's estimates of returning emigrants. The census provides the number of people who were outside Canada at the time of the previous census and returned during the intercensal period. That number includes all returning emigrants. Then Demography Division's estimate of the returning emigrants component is subtracted to produce the number of returning temporary emigrants. The estimated numbers of departures (RRC) and returns (census and Demography Division) yield an estimate of net temporary emigration.

This estimate is for the whole intercensal period; it is disaggregated into estimates for each of the five years in the period and then into monthly estimates using a seasonal adjustment that is an average between zero seasonality and the seasonality of emigration.

Net temporary emigration is calculated first for the national level. It is then disaggregated by province or group of provinces based on RRC estimates of temporary emigration. For the Atlantic provinces and the territories, the

estimate for the group is disaggregated on the basis of each province / territory's proportion of the group's total population.

Net temporary emigration can be estimated only for the intercensal period preceding the most recent census. Net temporary emigration in the current period is assumed to be the same as in the previous period for each province and territory.

The emigration age and sex distribution is applied to obtain the age and sex structure of the net temporary emigration.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the emigration estimate used to calculate the seasonal adjustment for the net temporary emigration. The same estimation method is used.

G. Returning emigrants

A returning emigrant is a person who returns to Canada after having been classified as an emigrant. In a manner similar to the procedure used to calculate the number of emigrants, data from the Canada child tax benefit (CCTB) file from Canada Revenue Agency (CRA) and T1FF⁵ file are used to estimate the number of returning emigrants. Adjustment factors are applied to compensate for the fact that the CCTB program is not universal, and an adult/child ratio is used to estimate the number of adult returning emigrants. As a result, four adjustment factors are used to take into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of returning emigrant children based on two versions of the CCTB files;
- the program's partial coverage, that is, people who do not apply for the CCTB or who are not eligible. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FFs;⁵
- the adult / child ratio, which is based on the census by age and sex (From 2006/2007, we are using distribution by age and sex derived from 2006 Census. The 2011 ratio will be available only after the release of the estimates by age and sex based on the 2011 Census).

The age and sex distribution of returning emigrants is based on the National Household Survey (NHS) data Characteristics of returning emigrants are derived from the question on the place of residence one year ago, after excluding non-permanent residents and immigrants.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

H. Interprovincial migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As is the case for emigration, there is no provision for recording interprovincial migration in

Canada. Consequently, such movements have to be estimated using data from the Canada child tax benefit (CCTB) of Canada Revenue Agency (CRA) and T1FF.⁵

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of tax filers' dependants has to be imputed. An adjustment is also required to take into account migrants who do not file income tax returns. From 2001/2002 to 2005/2006, the adjustment was slightly modified (for further information, see *Wilkinson, 2004*). From 2006/2007, this adjustment has been slightly modified (Cyr, 2008 – Internal document).

Since income tax returns are not available at the time preliminary estimates are produced, the estimation of preliminary² interprovincial migration is based on CCTB administrative files, which provide counts of child migrants (aged 0 to 17) receiving benefits under the program. The estimates have to be adjusted later for children who are not receiving the CCTB. Finally, the number of adult migrants is calculated using the number of child migrants and factors derived from the T1FF.⁵ As a result, three adjustment factors are used to take into account:

- the program's partial coverage, that is, people who do not apply for CCTB or who are not receiving benefits. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to migrate between children who are receiving the CCTB and children who are not. This factor is obtained by comparing the out-migration rates of children receiving the CCTB with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last available year of T1FF;⁵
- the differential propensity to migrate between adults and children. This factor generates the out-migration rate of the population aged 18 and over for each province / territory of origin and destination. It is obtained by calculating the ratio of the central migration rate for adults to the rate for children. It is estimated using data from the last three available years of T1FF.⁵

The adult migration rate is then applied to the estimated adult population. The number of adult migrants is then added to the number of child migrants to produce the number of interprovincial migrants for the entire population.

Interprovincial migration by age and sex is derived from T1FF⁵ data and counts derived from the NHS question on the place of residence one year ago. From 2011/2012, the 2011 NHS age and sex distribution is used.

Levels of estimates

For information on the differences between preliminary² and final estimates of total interprovincial migration, see section **H. Interprovincial migration** above.

Intercensal population estimates

Intercensal estimates – population estimates for reference dates between two censuses – are produced following each census. They reconcile previous postcensal estimates with the new census counts.

There are two main steps in the production of intercensal estimates:

- calculation of the error of closure;
- linear distribution of the error of closure.

The error of closure is defined as the difference between the postcensal population estimates on Census Day and the population enumerated in that census adjusted for CNU.¹

The error of closure is spread uniformly over the intercensal period of days within each month.

Intercensal estimates by age and sex are adjusted in the same way, i.e., by distributing the error of closure uniformly across the age-sex cohorts.

Quality of demographic data

The estimates contain certain inaccuracies stemming from two types of errors:

- errors in the census data;
- imperfections in other data sources and the method used to estimate the components.

Census data

A. Coverage, response and imputation errors

The errors attributable to census data can be divided into two groups: response and processing errors, and coverage errors. The first group implies non-response error, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of errors are intrinsic to any survey data.

The coverage errors occur when dwellings and/or individuals are missed, incorrectly included (except for the 2006 and 2011 censuses, where people incorrectly included were not considered in the Census Overcoverage Study) or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main studies are the Reverse Record Check Survey (RRC) and the Census Overcoverage Study (COS). Based on these studies, estimates of census net undercoverage (CNU) (which is equal to the difference between undercoverage and overcoverage) are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

When creating base populations, the Estimates Program corrects the census populations only for coverage errors. This correction, which is based on the findings of coverage studies, is primarily subject to sampling errors, and to a lesser extent, processing errors. Statistical tests indicate that coverage adjustments improve the quality of census data. The Estimates Program uses the estimates from coverage studies for the provinces and territories. However, given the size of the samples in these studies, estimates by age and sex are modelled. Furthermore, it is assumed that the coverage rates estimated for a province or territory apply to the regions within that geographic area. Prior to 1991, the Estimates Program used census data that was unadjusted for coverage errors. Coverage studies had been done to measure undercoverage, but none measured overcoverage. Following the decision to integrate a correction for the coverage to the enumerated population in 1991, the Program had to revise the population estimates for the period from 1971 to 1986. The correction is based on the findings of the coverage studies conducted during this period and on hypotheses regarding the ratio between the overcoverage and undercoverage levels based on the findings of subsequent coverage studies.

The corrections to the census data due to CNU improved, in general, the quality of the estimates by compensating for the differential undercoverage by age, sex and by province/territory across censuses.

Text table 1

Estimated census net undercoverage, Canada, provinces and territories, 2001, 2006 and 2011 Censuses

1. The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors.

These adjustments have a direct impact on:

- the error of closure and its distribution by age and sex within a province or a territory as well as by province/territory as the CNU¹ and its distribution vary from one census to another;

- within-cohort consistency of population estimates. If for example, the male cohort in age group 0 to 4 in 1981 was tracked up to the 2001 Census (unadjusted for CNU)¹ the age group 20 to 24 would be noticeably smaller in 2001 than the age group 15 to 19 in 1996. Since Canada receives many immigrants within these age groups, the opposite would be expected. However, only after adjustment for CNU,¹ the cohort size increases from 1996 to 2001.

Text table 2

Census adjustment rates by age group, 2001, 2006 and 2011 censuses, Canada

	2001	2006	2011
All ages	3.10	2.79	2.32

100 years and over	-9.58	-7.37	-11.85

Note(s): The census adjustment represents the sum of census net undercoverage, incompletely enumerated Indian reserves and demographic adjustment.

For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: 1996, 2001, 2006 and 2011 Census Technical Report on Coverage.

Components

Errors due to estimation methodologies and data sources other than the census can also be significant.

A. Births and deaths

Since the law requires the recording of vital statistics, the final estimates for births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

B. Immigration and non-permanent residents

With respect to immigrants and non-permanent residents, Citizenship and Immigration Canada (CIC) administers special data files on both of these components. Since immigration is controlled by law, data on immigrants and NPRs are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the Visitor Data System (VDS) from (CIC) is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of NPRs are more prone to error than data on immigrants.

C. Emigration, returning emigration and net temporary emigration

Of all the demographic components that are used in the population estimates program, the emigration, returning emigration and net temporary emigration are the most difficult to estimate with precision. Canada does not have a complete border registration system. While immigration and non-permanent residents (NPRs) are well documented by the federal government, Statistics Canada has always used indirect techniques for the estimation of the number of persons leaving the country. For this reason, available statistics regarding these three components have historically been of a lower quality than other components.

Estimates of the number of emigrants and returning emigrants are both derived using Canada child tax benefit (CCTB) data provided by Canada Revenue Agency (CRA). Estimates must be adjusted to take into account the incomplete coverage of the program and to derive the emigration and returning emigration of adults.

These adjustments and the delay in obtaining the data are the two main sources of errors. As current information on the number of persons living temporarily abroad does not exist, estimates are based on the Reverse Record Check (RRC) and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Moreover, assumptions were made to allow for the distribution of annual estimates to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

D. Interprovincial migration

Since July 1993, preliminary² interprovincial migration estimates have been based on Canada child tax benefit (CCTB) files. Under this program, only 76% of children aged 0 to 17 at the Canada level were entitled to benefits on July 1, 2001. Consequently, preliminary CCTB based estimates are subject to larger error than final estimates derived from Canada Revenue Agency (CRA) tax files.

E. Level of detail of components

As a more detailed breakdown of the data introduces a greater risk of inaccuracy into the estimates, the possibility of error in the components is augmented by the method used to distribute the estimates by age and sex. It seems that, in general, the initial errors should be minimal where the distribution of annual estimates of births, deaths and immigrants is concerned, and more significant with regard to the distribution of other components (non-permanent residents, emigrants, returning emigrants, net temporary emigrants and interprovincial migrants). Finally, the size of error due to the age and /sex distribution may vary by period and errors in some components may have a greater impact on a given age group or sex.

Quality assessment

In order to assess the quality of our estimates, two evaluation measures are used: precocity errors and errors of closure.

A. Precocity error

The quality of preliminary estimates of components is evaluated using precocity errors. Precocity error is defined as the difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates. The precocity error measures the impact of the trade-off of accuracy in favour of timeliness on the estimated population. The precocity error is calculated as:

Figure 7

Precocity error

$$PE_{(t-1,t)} = \frac{(N_{(t-1,t)}^{preliminary} - N_{(t-1,t)}^{final})}{P_{t-1}} \times 1,000$$

where,

$PE_{(t-1,t)}$ = the precocity error for the period from t-1 to t;

$N_{(t-1,t)}^{preliminary}$ = the preliminary estimate of a component of demographic change;

$N_{(t-1,t)}^{final}$ = the final estimate of a component of demographic change;

P_{t-1} = estimated population for the relevant geographical area at time t-1.

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Precocity error can either be positive or negative. A positive precocity error denotes that the preliminary estimate is larger than the final estimate while a negative precocity error indicates the opposite.

Precocity error by component for Canada

At the national level, immigration component yielded the smallest precocity errors, with values close to zero per thousand throughout the years under consideration. On the other hand, interprovincial in-migrants and out-migrants¹ yielded the greatest precocity errors, ranging between 0.92 per thousand and 2.55 per thousand during the period 2008/2009 and 2011/2012 (see text table 3).

1. At the national level, net interprovincial migration equals to zero as the sum of interprovincial in-migrants is equivalent to the sum of interprovincial out-migrants across provinces and territories.

Precocity errors for births were mostly small when compared to other components, with the largest precocity error of -0.29 per thousand in 2007/2008. Similar to births, precocity errors for deaths were also low, with values less than 0.32 per thousand in current years.

Precocity errors for emigration and returning emigration were mostly negative, i.e. preliminary estimates were smaller than final estimates. During the years under consideration, precocity error for emigration was lowest in 2009/2010 at 0.05 per thousand and largest in 2007/2008 at -0.48 per thousand. For returning emigration, the values ranged from -0.20 per thousand in 2008/2009 to -0.33 per thousand in 2007/2008 and 2010/2011. During the period 2007/2008 to 2010/2011, the precocity errors for net temporary emigration were positive and low, at 0.05 per thousand throughout those years.

Precocity errors for net non-permanent residents were negative and low during the period under consideration. From 2007/2008 to 2009/2010, precocity errors were stable at -0.04 per thousand and increased slightly to -0.08 per thousand in 2010/2011.

Precocity error by component for provinces and territories

In general, precocity error is typically larger for smaller provinces or territories as it is an error measurement relative to population size. At the provincial level, precocity errors larger than ± 10.0 per thousand occurred only once for Prince Edward Island during the current four years under consideration, however, this occurred many times for the three territories (refer to text table 3).

At the provincial and territorial level, precocity errors for births were small and mostly negative, ranging from close to 0.0 per thousand (Quebec in 2009/2010)² to -1.67 per thousand (Nunavut in 2009/2010). Similar to births, precocity errors for deaths were also low but predominantly positive. Over the years, the largest precocity error for deaths was 1.03 per thousand (Northwest Territories in 2010/2011).

Compared to other demographic components, precocity errors for immigration were low among the provinces and territories, with absolute error values no more than 0.50 per thousand over the current years. Net non-permanent residents was another component that yielded small precocity errors, with absolute error values less than 0.42 per thousand across the provinces and territories.

Precocity errors for emigration ranged from the lowest at 0.01 per thousand (Saskatchewan in 2007/2008) and -0.01 per thousand (New Brunswick in 2009/2010) to the largest at -1.56 per thousand (Northwest Territories in 2007/2008). Precocity errors for returning emigration were mostly negative; the values ranged from around zero per thousand for some years in the three territories to -0.74 per thousand for Yukon in 2009/2010. Precocity errors for net temporary emigration were positive during the years under consideration, except for British Columbia (2007/2008 to 2010/2011) and the Northwest Territories (2008/2009 to 2010/2011 only).

Precocity errors for interprovincial in-migrants and out-migrants show that final estimates of these components were systematically lower than preliminary estimates (with three exceptions for in-migrants and one exception for out-migrants).

At the provincial level, the largest precocity error for net interprovincial migration was -6.63 per thousand (Prince Edward Island in 2009/2010), while the smallest was close to zero per thousand (Quebec in 2009/2010). Compared to the other provinces, precocity errors for Ontario and Quebec were relatively low during the years under consideration, with the largest error for these two provinces at -0.42 per thousand for Quebec in 2008/2009. Precocity errors for net interprovincial migration for Alberta, the gainer in net interprovincial migration in recent years, ranged from a low of 0.30 per thousand in 2009/2010 to a high of 2.73 per thousand in 2008/2009.

Contribution of components to the sum of precocity errors

When looking at aggregated estimates of precocity errors, there is the potential for a “netting-out” effect, referring to negative precocity errors in one component canceling out positive errors in another component. The analysis of the contribution of each component to the sum of precocity errors without the netting-out effect can be done by using absolute values of the precocity errors. A mean absolute percentage precocity error by component is calculated by dividing the mean absolute precocity error by component by its sum and expressed in percentages. In this case, the mean absolute precocity error by component is the mean of the absolute precocity errors for the 2006/2007 to 2010/2011 period.

At the national level, the mean absolute precocity error for the total emigration³ component contributed the most to the sum of mean absolute precocity errors (62.37%), followed by births (15.22%) and deaths (13.89%), between 2006/2007 and 2010/2011. Immigration and net non-permanent residents each accounted for less than 9.0% to the sum of mean absolute precocity errors (refer to text table 4).

2. As mentioned in the Methodology Section, the provincial statistical agencies of Quebec and British Columbia provide their most recent estimates of births and deaths to Statistics Canada. The figures are used to produce preliminary estimates.

3. Mean absolute percentage precocity error for total emigration includes the mean absolute percentages for emigration, returning emigration and net temporary emigration.

Text table 4

Mean absolute percentage precocity error by components, 2006/2007 to 2010/2011, Canada, provinces and territories

	Births	Deaths	Immigration	Total ¹ emigration	Net non-permanent residents	Net interprovincial migration	Total
	percent						
Canada	15.22	13.89	0.15	62.37	8.36	0.00	100.00

Nova Scotia	13.21	10.61	0.59	23.44	0.73	51.41	100.00
New Brunswick	21.53	19.82	0.54	22.39	0.42	35.30	100.00
Quebec	1.92	4.50	4.42	56.59	8.81	23.77	100.00
Ontario	10.26	14.26	1.38	47.96	7.66	18.48	100.00
Manitoba	14.33	11.20	2.10	29.81	3.07	39.50	100.00
Saskatchewan	12.96	6.45	1.28	15.04	0.89	63.38	100.00
Alberta	12.86	5.44	2.18	22.55	4.55	52.42	100.00
British Columbia	1.15	1.75	1.22	66.54	0.79	28.55	100.00
Yukon	6.63	5.03	1.10	8.22	3.10	75.91	100.00
Northwest Territories	6.45	3.86	0.53	13.23	2.18	73.75	100.00
Nunavut	8.53	3.52	0.41	6.96	1.16	79.43	100.00

1. Total emigration includes emigration, returning emigration and net temporary emigration.

At the provincial and territorial level, the contribution of individual component to the sum of mean absolute precocity errors was not uniform across the country. Net interprovincial migration accounted for the largest share of the sum of mean absolute precocity errors in ten out of the thirteen provinces and territories, ranging from 35.30% in New Brunswick to 79.43% in Nunavut. In Quebec, Ontario and British Columbia, total emigration contributed the most to the sum, with 56.59%, 47.96% and 66.54%, respectively (refer to text table 4).

On the other hand, births accounted for the smallest share of the sum of mean absolute precocity errors in Quebec, at 1.92%. Between 2006/2007 and 2010/2011, net non-permanent residents accounted for the smallest share of the sum of mean absolute precocity errors in Newfoundland and Labrador (1.02%), Prince Edward Island (1.63%), New Brunswick (0.42%), Saskatchewan (0.89%) and British Columbia (0.79%). For the rest of the provinces and territories, the contribution of immigration to the sum was the smallest, at 2.18% or below.

Precocity errors by age and sex are not currently available.

B. Error of closure

The error of closure measures the exactness of the final postcensal estimates. It is defined as the difference between the final postcensal population estimates on Census Day and the enumerated population of the most recent census adjusted for census net undercoverage (CNU¹). A positive error of closure means that the postcensal population estimates have overestimated the population.

The error of closure comes from two sources: errors primarily due to sampling when measuring census coverage and errors related to the components of population growth over the intercensal period. For each five-year intercensal period, the error of closure can only be calculated following the release of census data and estimates of CNU¹. The error of closure can be calculated for the total population of each province and territory as well as by age and sex.

Text table 5 shows postcensal population estimates on May 10, 2011 and census counts adjusted for CNU¹ and the errors of closure for Canada, provinces and territories for 2001, 2006 and 2011.

For Canada as a whole, the error of closure was estimated at 171,115 or 0.50% in 2011. This is an increase over the errors for 2001 (0.16%) and 2006 (0.14%).

The population estimates overestimated the population of six provinces, two territories and Canada as a whole. Four provinces and two territories posted errors of closure greater than 1% or less than -1%. Of these jurisdictions, only Newfoundland and Labrador's estimated population differed from the adjusted census population by more than 2% (-2.09%). In 2006, two provinces and three territories posted errors of closure greater than 1% or less than -1%, while this was the case for three provinces and two territories in 2001.

By considering the variance in CNU, it is possible to identify errors of closure that are statistically significant. Text table 5 shows the results of this analysis.

The error of closure is statistically significant for Canada, five provinces and one territory. This means that the population estimates significantly overestimated or underestimated the adjusted census population in these jurisdictions. As noted above, these results are due to both the sampling for census coverage studies and errors in the components of population growth over the intercensal period. Among these components, interprovincial migration and emigration are mostly associated with large errors of closure.

Text table 5

Error of closure of the population estimates, Canada, provinces and territories, 2001, 2006 and 2011

Geography	Postcensal estimate on Census Day	Census ¹ adjusted for CNU	Error of closure		CNU ² standard error	t ³ value

Nunavut	28,051	28,001	50	0.18	411	0.12

1. Census net undercoverage includes the incompletely enumerated Indian reserves.

2. Census net undercoverage excludes the incompletely enumerated Indian reserves.

3. An error of closure with a t value greater than 1.96 or less than -1.96 is statistically significant at the 95% confidence level.

The error of closure can be calculated for total population estimates and for age and sex.

Text table 6

Error of closure of the estimates of population by age and sex, 2011, Canada

	Both sexes		Male		Female	
	Number	Percentage	Number	Percentage	Number	Percentage

Appendix A

Glossary

Age

Age as of July 1.

Ageing (of a population)

An increase in the **number of old persons** as a percentage of the total population.

Average age

The average age of a population is the average age of all its members.

Census coverage

Census net undercoverage: Difference between undercoverage and overcoverage.

Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to be enumerated in a census but were not.

Cohort

Represents a group of persons who have experienced a specific demographic event during a given year. Thus, the married cohort of 2001 consists of the number of persons who got married in 2001. In the cast of births, persons born within a specified year are referred to as a generation.

Components of demographic growth

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter either the total population or the age and sex of the population.

Dependency ratio

The **ratio of the combined population** aged from **0 to 14 years old** and the population **aged 65 years** and over to the population aged from **15 to 64 years old**.

Emigrant

Canadian citizen or **immigrant** who has left Canada to establish a permanent residence in another country.

Error of closure

Difference between the **postcensal estimate** at the census date and the results of the census adjusted for **census net undercoverage** (including adjustment for incompletely enumerated Indian reserves).

Generation

Unless otherwise specified, refers here to a group of persons born within a given period. The 2001 generation represents people born during the year 2001.

Immigrant

Within the framework of this publication, the term immigrant refers to **landed immigrant**. An immigrant is a person who does not have Canadian citizenship but was granted the right by the immigration authorities to live in Canada on a permanent basis.

International migration

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to **immigrants, emigrants, returning emigrants, net temporary emigrants** and **net non-permanent residents**.

Interprovincial migration

Interprovincial migration represents movement between provinces or territories involving a change in the usual place of residence. A person who takes up residence in another province or territory is an **out-migrant** with reference to the province or territory of origin and an **in-migrant** with reference to the province or territory of destination.

Median age

The median age is an age "x", such that exactly one half of the population is older than "x" and the other half is younger than "x".

Natural increase

Variation in the population size over a given period as a result of the difference between the numbers of births and deaths.

Net international migration

Net international migration is obtained according to the following formula: **Immigrants + returning emigrants + net non-permanent residents - (emigrants + net temporary emigrants)**.

Net interprovincial migration

Net interprovincial migration represents the difference between **in-migrants** and **out-migrants** for a given province or territory.

Net non-permanent residents

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

Non-permanent residents

A non-permanent resident belongs to one of the five following groups:

- persons with a usual place of residence in Canada who are claiming refugee status;

- persons with a usual place of residence in Canada who hold a Study Permit;
- persons with a usual place of residence in Canada who hold a Work Permit;
- persons with a usual place of residence in Canada who hold Minister's permits (including extensions);
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work permits or minister's permits and living in Canada.

Net temporary emigrant

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and **immigrants** living temporarily abroad who have not maintained a usual place of residence in Canada.

Population

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is within that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered **non-permanent residents**.

Population estimate

- Postcensal:** Population estimate produced by using data from the most recent available census adjusted for **censusnet undercoverage** (including adjustment for incompletely enumerated Indian reserves) and estimate of the **components of demographic growth** since that last census. This estimate can be preliminary, updated or final.
- Intercensal:** Population estimate derived by using **postcensal estimates** and data adjusted for **censusnet undercoverage** (including adjustment for incompletely enumerated Indian reserves) of censuses preceding and following the year in question.

Population growth or total growth

Variation of population size between two dates. It can also be obtained by summing the **natural increase**, **total net migration** and if applicable, subtract **residual deviation**. It can be positive or negative.

Precocity error

Difference between preliminary and final estimate in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for either population estimates or components of population growth.

Rate

Refers to the ratio of the number of events estimated in a year ($t, t+1$) to the average populations at the beginning and the end of the period. In this regard, births, deaths, immigration rates, etc are calculated. Generally, the rates are expressed in per 1,000.

Demographic growth rate or population growth rate: Ratio of population growth between the year t and $t+1$, to the average **population** of both these years. The rate is generally expressed in per 1,000.

Overcoverage of population rate: The ratio of the number of persons who should not have been counted in the census or who were counted more than once to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Undercoverage of population rate: The ratio of the estimated number of persons not enumerated in the census (who were intended to have been enumerated) to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Census net undercoverage of population rate: The difference between the census undercoverage rate and the census overcoverage rate.

Residual deviation

Difference between demographic **population growth** calculated using **intercensal estimates** of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution (based on the number of days) of the **error of closure** between years within the quinquennial period.

Returning emigrant

Canadian citizen or **immigrant** having previously emigrated from Canada and subsequently returned to the country.

Sex ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live-born boys to the number of live-born girls. This ratio is usually expressed as an index, with the number of females taken to be a base of 100.

Sprague coefficients

Series of factors which, when multiplied to a population distributed by multiples age groups, give a distribution of the same population by single years of age.

Total net migration

Sum of **net international** and **net interprovincial** migration.

Vital events

Includes all the demographic events (births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

Year

Unless otherwise specified, the term "year" refers to the period beginning July 1 of a given year and ending June 30 of the following year.

Appendix B

Sources and remarks

Base population

May 10, 2011 Census of Population adjusted for census net undercoverage and incompletely enumerated Indian reserves.

2011 Census: Statistics Canada, Census of Canada, 2011, Catalogue no. 98-310-XWE 2011002.

Census net undercoverage: See The Daily, September 26, 2013.

Incompletely enumerated Indian reserves: See The Daily, September 26, 2013.

Births and deaths

Statistics Canada, Health Statistics Division.

Statistics Canada, Demography Division, catalogue no. 91-215-X, annual.

Births: Fertility rates for 2011 based on births by age of mother provided by Health Statistics Division applied to the female population estimates at the beginning of the quarter. Births for Quebec and British Columbia were provided by their respective agencies.

Deaths: Mortality rates for 2011 based on deaths by age group and sex provided by Health Statistics Division applied to the population estimates by age group and sex at the beginning of the quarter. Deaths for Quebec and British Columbia were provided by their respective agencies.

Immigration

Estimates are based on the immigrant files provided by Citizenship and Immigration Canada (CIC) according to information made available on August 19, 2013.

Emigration

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB) program. For 2011/2012 and 2012/2013, we used 2010/2011 data;
- tax data calculated using T1FF file provided by the Income Statistics Division of Statistics Canada. For 2011/2012 and 2012/2013, we used 2010/2011 data;
- data provided by the U.S. Department of Homeland Security, Office of Immigration Statistics. For 2012/2013, we used 2011/2012 data;
- data on the number of adult and children emigrants from T1FF file used for the provincial distribution of adults.

Returning emigration

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB) program. For 2011/2012 and 2012/2013, we used 2010/2011 data;
- 2006 Census – question on the place of residence one year ago.

Net temporary emigration

The estimates are produced by Demography Division using:

- data from the Reverse Record Check (RRC) of the 2011 Census;
- 2011 National Household Survey – question on the place of residence one year ago;
- estimates of returning emigrants for 2006/2011 intercensal period.

Non-permanent residents

The estimates are produced by Demography Division using Field Operational Support System files (FOSS) from CIC. These files, received on August 19, 2013, document the number of persons holding permits/authorizations or claiming refugee status.

Interprovincial migration

The estimates are produced by Demography Division using:

- CCTB-based adjusted migration data for children;
- factors corresponding to the ratio of the migration rate of all children to the migration rate of eligible children calculated using 2011/2012 tax file data;
- factors used to calculate adult migration and corresponding to the ratio of the adult to child migration rates, calculated on a three-year basis using tax file data for 2009/2010, 2010/2011 and 2011/2012.
