How to Reach Us

To Obtain More Information

Inquiries about products and services should be directed to one of the following Statistics Canada Reference Centres:

St. John's	(709) 772-4073
Halifax	(902) 426-5331
Montréal	(514) 283-5725
Ottawa	(613) 951-8116
Toronto	(416) 973-6586
Winnipeg	(204) 983-4020
Régina	(306) 780-5405
Edmonton	(403) 495-3027
Calgary	(403) 292-6717
Vancouver	(604) 666-3691

A toll-free number is provided in all provinces and territories, for users who reside outside the local dialing area of any of the Regional Reference Centres.

1. INTRODUCTION

This user guide provides information on the coverage, content and data quality of the 1991 Street Index. It also includes a section on technical specifications and a glossary of terms.

The Street Index links streets and address ranges to provinces (PR), federal electoral districts (FED), census divisions (CD), census subdivisions (CSD), census tracts/provincial census tracts (CT/PCT), and enumeration areas (EA). Three computer printouts are available as separate print-on-demand products, each portraying a different linkage. The streets and address ranges are linked to: PR/FED/EA; PR/CD/CSD; and CT/PCT.

Coverage

Street indexes are available where there is Street Network File (SNF) coverage, that is, for large urban centres containing at least one municipality with a population of 50,000 or more. The Street Index is available for 25 census metropolitan areas (CMA) and 19 census agglomerations (CA). In some cases, only portions of CMAs/CAs are covered by SNF; thus some urban centres may be only partially covered by the Street Index (Table 1).

Content

Each Street Index contains street attributes and linkages to specific standard geographic areas. The street attributes comprise street name (including street type and street direction), and odd and even address ranges. The street names are listed in alphabetical order.

Reference Date

All census data reflect the census reference date of June 4, 1991. There is also a Geographic Reference Date for the geographic framework that supports the census. This date is earlier than the census reference date in order to give Statistics Canada enough time before Census Day to process the necessary boundary and name changes. For the 1991 Census, the Geographic Reference Date is January 1, 1991, provided that the information on any changes was received by Statistics Canada from provincial or territorial authorities by March 1, 1991.

The street attributes and linkages to the standard geographic areas are obtained from three separate sources: the Street Network Files (SNF), the Geographic Attribute Data Base (GADB), and the EA Digital Boundary File. Each source has its own inherent reference date, as follows:

- **Street Network Files:** vary between June 1986 and December 1991 for the network information, and between June 1986 and February 1991 for the address information.
- **Geographic Attribute Data Base:** January 1, 1991 for the geographic attributes and linkages. Corrections were subsequently made to the Street Index for EA linkage errors found on GADB as of November 30, 1992.
- **EA Digital Boundary File:** January 1, 1991. The EAs that were split on Census Day due to dwelling increases are included in the boundary file.

Limitations

In certain cases, address ranges are not printed in the sequence in which they are physically found on the ground. This limitation is due to the coding structure and file organization of the Street Network Files. In addition, some address ranges are assigned to FED, EA and CT codes that are set to zero (0) because their respective block-face representative points fall outside these geographic areas.

Despite the linkage to the 1991 Census, the Street Network Files have not been updated using the information collected during the 1991 Census field operations. Consequently, users should be aware that some streets and attributes have not been added to the Street Network Files.

Table 1

Street Index Coverage

This list denotes which CMAs and CAs are covered by the Street Index, and whether the urban centre is wholly or partially covered by the index. A blank indicates that the entire CMA or CA is covered by the Street Index.

<u>CMA/CA Name</u>	<u>Coverage</u>	<u>CMA/CA Name</u>	<u>Coverage</u>
Belleville	partial	Prince George	
Brantford		Québec	partial
Calgary	partial	Red Deer	
Chicoutimi - Jonquière	partial	Regina	partial
Edmonton	partial	Saint-Jérôme	partial
Fredericton	partial	Saint John	partial
Guelph		Sarnia - Clearwater	
Halifax	partial	Saskatoon	partial
Hamilton		Sault Ste. Marie

Oshawa		Windsor	partial
Ottawa - Hull		Winnipeg	
Peterborough	partial	Woodstock	

Note: The five urban centres denoted in bold text are covered by provincial census tracts (PCT). The remaining centres are covered by census tracts (CT).

2. DATA QUALITY

The purpose of a data quality report is to provide detailed information for users to evaluate the suitability of the data or product for a particular use. Five fundamental components of a data quality statement are: lineage, positional accuracy, attribute accuracy, logical consistency and completeness.

Since the data for the Street Index were extracted from three distinct files, users should consult the detailed data quality statements for each of the following source files:

- Street Network File, User Guide (AMF Format).
- 1991 Digital Boundary Files, User Guide.
- 1991 Geographic Attribute Data Base, Data Quality Statement.

Lineage

Lineage includes descriptions of the source material from which the data were derived and the methods of derivation, including the dates of the source material and all transformations involved in producing the final digital files or map products.

Source Information

The Street Index was derived from the following source files:

1. The **Street Network Files (AMF Format)** provided the street names (including street types and direction), and odd and even address ranges within the individual CMAs and CAs. The reference date for the network information varies between June 1986 and December 1991, and between June 1986 and February 1991 for the address information.
2. The **1991 EA Digital Boundary File** provided the province, federal electoral district (FED) and enumeration area (EA) links to the streets and street attributes. The geographic reference date is January 1, 1991. The EAs that were split on Census Day due to dwelling increases are included in the boundary file.
3. The **1991 Geographic Attribute Data Base** provided the names, codes and linkages for the geographic areas. The reference date is January 1, 1991.

Method of Derivation

Various SAS computer programs (IBM mainframe-based) were used to extract, compile and verify the information. The first program used the Street Network Files to extract the street attribute information and the block-face representative points. An ARC/INFO® point-in-polygon algorithm was used on the EA Digital Boundary File to determine which SNF block-face representative points fell within the individual EAs; this in turn provided the province, FED and EA linkages to the block-face representative points.

The extracted information from the SNF and EA Digital Boundary File was then merged, which resulted in the linkage of province, FED and EA codes to the street attributes.

The Geographic Attribute Data Base supplied the other necessary linkages and names/codes for the standard geographic areas. Portions of the extracted information from GADB were corrected due to linkage errors found on the final GADB file. A special Street Index print program provided the CT/PCT, CD/CSD and CMA/CA linkages to the street attributes.

Although the Street Index does not contain block-face representative points, users should be aware of how the points are generated since they were used to link the SNF street attributes with the PROV/FED/EA codes. Block-face representative points are computed within all Street Network Files along addressable streets and addressable sections of highways. The representative point is located at the mid-point of the block-face, set back a perpendicular distance of 22 metres from the street centre line. Due to the computation method, block-face representative points may not be unique. For example, perpendicular block-faces of equal length may be assigned representative points having the same coordinate values.

Positional Accuracy

Positional accuracy is the difference between the "true" position of a feature in the real world and the "estimated" position stored in the digital file or other product.

Although the Street Index printouts do not contain any x,y positional data, users should be aware that there are 130 block-face representative points – although having the correct CD/CSD code – that fall outside the CD/CSD in which they should be located. This occurs because of the 22 metre rule to locate the points.

Attribute Accuracy

Attribute accuracy refers to the accuracy of the non-positional information attached to each feature.

The Street Index reflects the accuracy of the Street Network Files from which street attributes were extracted, and the 1991 Geographic Attribute Data Base from which the names and codes of geographic areas were extracted.

For the 130 block-face representative points that fall outside the CD/CSD in which they should be located, the FED, EA and CT codes are set to zero. Table 2 shows the number of incomplete block-face linkages for the affected CMAs and CAs.

Logical Consistency

Logical consistency describes the fidelity of relationships encoded in the data structure of the digital spatial data (i.e. how well elements of the data structure follow the rules imposed on them).

A post census verification confirmed that the PROV/FED/EA linkages were consistent with the extracted information from both the Geographic Attribute Data Base and the 1991 EA Digital Boundary File.

Completeness

Completeness expresses the degree to which geographic entities (features) are captured according to the data capture specifications. It also includes information about selection criteria, definitions used and other relevant mapping rules.

The Street Index does not provide information for those parts of CMAs or CAs outside Street Network File coverage. The Street Indexes collectively provide street attributes and linkages to standard geographic areas within CMA/CA coverage for 769,066 block-face records.

Users should also be aware that some street names and address ranges are unidentified or unavailable. In addition, the Street Network Files have not been updated using the information gathered during the 1991 Census field operations. Consequently, some streets and attributes have not been added to the Street Network Files.

TOTAL	130

3. TECHNICAL SPECIFICATIONS

This section describes the coding rules and abbreviations used for the Street Indexes.

Street Name

Street names are generally based on municipal documents provided to the Street Network File program.

Users should note the following coding rules:

- names are truncated (at the end) if they exceed the maximum field size of 20 characters.
- formats of the word "Saint" and "Sainte" are abbreviated as ST and STE.
- most numeric streets are coded using the number rather than the alphabetic spelling (for example, First Avenue is 1 AV).
- most articles are coded at the end of the street name (for example, The Queensway becomes QUEENSWAY, THE, and De l'Eglise becomes EGLISE, DE L').
- all unidentified street names are coded using 3-digit numbers prefixed by a "Z" (e.g. Z001).

Street Type

Street type is a two-letter code that identifies the different types of addressable streets (Table 3).

Street Direction

Street direction is a one- or two-letter code that denotes the location of the street relative to a pre-defined origin (for example, Sherbrooke St. West). The street direction is included only if it is part of the street name (Table 4). The direction should not be misconstrued as being the geographic direction of the street.

Address Range

The symbol "#-#" indicates that the address range was either not known at the time of updating the Street Network Files or did not exist for a particular block-face (for example, parks and golf courses). An asterisk (*) separates the odd address ranges from the even address ranges.

Affiliated Community

The Street Index sometimes contains streets having the same name, type and direction. These streets are legitimately separate features, often being kilometres apart from one another. These duplicate attributes generally occurred because at one time these streets were located in different municipalities (CSDs) which were subsequently annexed.

In order to uniquely identify these duplicate street names, a one- or two-letter code is used after the street name. This code is normally an abbreviation of the "community", or former CSD in which it was located. The community abbreviations and the full community names by CMA/CA are provided in Appendix 1.

Census Subdivision Name

The name of the census subdivision (municipality) is a two-, three- or four-letter abbreviation of the official name. The CSD abbreviations and full CSD names by CMA/CA are shown in Appendix 1. Census subdivision types and abbreviations are shown in Table 5.

Table 3

VL	Village
VN	Village nordique

4. GLOSSARY OF TERMS

The glossary provides an explanation of the terms used in the Street Index. The terms are presented in summary form only. Please refer to the *1991 Census Dictionary* (Catalogue 92-301E) for the full definitions.

Block-face (BF). One side of a city street, normally between two consecutive intersections with streets or other features such as rivers and railways. A block-face is generally used for census data aggregation in large urban centres within Street Network File coverage.

Census Agglomeration (CA). A large urban area, together with adjacent urban and rural areas which have a high degree of economic and social integration with that urban area.

A CA is delineated around an urban area (called the urbanized core and having a population of at least 10,000, based on the previous census). If a CA's urbanized core population falls below 10,000, it is deleted from the CA program. However, if a CA attains an urbanized core population of at least 100,000, based on the previous census, it becomes a census metropolitan area (CMA).

Census Division (CD). A geographic area established by provincial law which is an intermediate area between the census subdivision and the province (e.g. division, county, regional district, regional municipality).

In Newfoundland, Manitoba, Saskatchewan and Alberta, provincial law does not provide for this administrative area. Therefore, CDs have been created by Statistics Canada in cooperation with these provinces.

Census Metropolitan Area (CMA). A very large urban area, together with adjacent urban and rural areas which have a high degree of economic and social integration with that urban area.

A CMA is delineated around an urban area (called the urbanized core and having a population of at least 100,000, based on the previous census). Once an area becomes a CMA, it is retained in the program even if its population subsequently declines.

Census Subdivision (CSD). A municipality as determined by provincial legislation (such as city, town, village), or its equivalent (e.g. Indian reserve, Indian settlement and unorganized territory).

In Newfoundland, Nova Scotia and British Columbia, other types of CSDs have been created by Statistics Canada in cooperation with the provinces as equivalents for municipalities.

Census Subdivision Type. The type indicates the municipal status of a census subdivision. CSDs are classified into various types, according to official designations adopted by provincial or federal authorities.

Census Tract (CT). A permanent, small urban neighbourhood-like or rural community-like area established in large urban centres with the help of local specialists interested in urban and social science research.

Census tracts are delineated jointly by a local committee and Statistics Canada. The population must be between 2,500 and 8,000, with a preferred average of 4,000 persons (except for those CTs in central business districts, in other major commercial and industrial zones, or in peripheral rural or urban areas that may have either a lower or higher population). Also, when first delineated or subsequently subdivided, CTs must be as socio-economically homogeneous and compact in shape as possible.

All CMAs and CAs in Canada containing a CSD having a population of 50,000 or more at the previous census are eligible for a census tract program.

Enumeration Area (EA). The geographic area canvassed by one census representative. The number of dwellings in an EA generally varies between a maximum of 375 in large urban areas to a minimum of 125 in rural areas. An EA always respects higher level geographic areas recognized by the census, and is the smallest unit for which census data are usually available.

Federal Electoral District (FED). Any place or territorial area entitled to return a member to serve in the House of Commons. FED legal limits and descriptions are the responsibility of the Chief Electoral Officer, and are usually revised every 10 years after the results of the decennial census.

The 1987 Representation Order is the most current one, and is based on 1981 Census population data.

Geographic Area. An area delineated or employed for the collection, compilation, analysis and dissemination of census data.

Geographic Attribute Data Base. A Statistics Canada relational data base which contains a number of attributes (such as names, codes, population and dwelling counts, land area) for standard geographic areas, and linkages between the geographic areas.

Province. The major political division of Canada. From a statistical point of view, it is a basic unit for which data are tabulated and cross-classified.

Provincial Census Tract (PCT). A permanent, small urban neighbourhood-like or rural community-like area established outside those CMAs and CAs having a census tract program. PCTs encompass populations between 3,000 and 8,000, with a preferred average of 5,000 persons.

Representative Point. Formerly called a centroid, a representative point is a pair of x,y coordinate values that represents a geographic entity for the purpose of assigning aggregate data to that entity.

Standard Geographical Classification (SGC). Statistics Canada's official classification of geographic areas in Canada. The SGC provides unique numeric identification for three types of geographic areas: provinces/territories; census divisions; and census subdivisions.

The three geographic areas are hierarchically related. CSDs aggregate to CDs, which in turn aggregate to a province or territory. This relationship is reflected in the 7-digit code: 2 digits for provinces/territories, 2 digits for census divisions and 3 digits for census subdivisions.

Street Network File (SNF). Formerly known as the Area Master File (AMF), the Street Network File is a computer-readable file that geographically references the street network and selected other non-street features (such as rivers, lakes, railways and municipal limits). SNFs are generally created for urban centres containing at least one municipality with a population of 50,000 or more at the previous census. These centres are normally in the census tract program.

The SNF contains the names for all street and non-street features. In addition, the intersection (corner) civic address ranges and block-face representative points are available for addressable streets.

Universal Transverse Mercator (UTM). An international grid system that covers the earth's surface between 84° N and 80° S. The earth is divided into 60 north-south zones, each of which is 6° of longitude wide. The zones are numbered from 1 to 60 eastward, beginning at the 180th meridian. A grid system is superimposed on the zones, and separate Transverse Mercator projections are centred on each zone.

5. ADDITIONAL SERVICES

In addition to the Regional Reference Centres and depository libraries, Statistics Canada publications may be ordered through your local bookstore or subscription agent. Contact the nearest Regional Reference Centre for a list of Canadian outlets available, or consult the *1991 Census Catalogue* (Catalogue 92-302E).

Secondary distributors offer data access and analytical support through a variety of consulting and computer-based services not available at Statistics Canada. The names and addresses of licensed distributors may be obtained from any Regional Reference Centre.

Statistics Canada provides digital geographic products which allow computer manipulation of geographic data. A customized retrieval service is available for users who wish to define their own geographic area of study. A variety of data retrieval files and services provide flexibility in selecting a geographic base.

A complete description of available digital files and services is documented in the *1991 Census Catalogue* (Catalogue 92-302E).

Information concerning Census of Agriculture products and services may be referenced in the *1991 Census of Agriculture Products and Services* (Catalogue 92-303), or by calling toll free 1-800-465-1991.

Users with special data requirements may request post-census survey services. Data are made available on microcomputer diskettes for use with spreadsheet software, or on paper output. For additional information, please contact the nearest Regional Reference Centre.

The Dissemination Division is responsible for CANSIM, Statistics Canada's computerized database network and information retrieval service. Users are provided with access to current and historical statistics in various forms including specialized data manipulation and analysis packages, graphics facilities and a bibliographic search service. For more information about CANSIM, contact any Regional Reference Centre.
