## RECREATIONAL MAIL SURVEYS, 1988 - <br> TIDAL SPORTFISHING DIARY PROGRAM AND VISITORS SPORTFISHING SURVEY

## PREFACE

The Tidal Sportfishing Diary Program was initiated in 1979 to obtain estimates of the sport catch by B.C. residents fishing in B.C. tidal waters. The Visitors Sportfishing Survey was first conducted in 1982 to obtain estimates of sport catch and expenditures by visitors fishing in B.C. tidal waters. Previous reports cover survey development and annual results. This report serves as a continuation of this series and deals with the 1988/89 results. Catch estimates are presented in these reports as survey results and are not necessarily the accepted numbers for all species and areas.

## ABSTRACT

Bijsterveld, L. 1989. Recreational mail surveys, 1988 - Tidal Sportfishing Diary Program and Visitors Sportfishing Survey. Can. MS. Rep. Fish. Aquat. Sci. 2042: vi +31 p.

Mail surveys collected 1988/89 licence year catch and effort data on recreational fishing in B.C. tidal waters. During $1,715,000$ angler days, adult anglers caught and kept $1,835,000$ salmon including 279,000 chinook and $1,367,000$ coho. Problems related to mail surveys are reviewed.

Keywords: sportfishing, tidal waters, logbook, mail survey, catch statistics

## RESUME

Bijsterveld, L. 1989. Recreational mail surveys, 1988 - Tidal Sportfishing Diary Program and Visitors Sportfishing Survey. Can. MS. Rep. Fish. Aquat. Sci. 2042: vi +31 p.

Lors d'enquêtes par correspondance, on a recueilli des données sur les efforts et les prises pour la saison de pêche récréative 1988-1989 dans les eaux de marée en C.B. Pendant $1,715,000$ jours-pêcheurs, les pêcheurs adultes à la ligne ont capturé et gardé $1,835,000$ saumons dont 279,000 saumons chinook et $1,367,000$ saumons coho. Les problèmes reliés aux enquêtes par correspondance sont l'étude.

Mots clés: pêche sportive, eaux de marée, journal de bord, enquête par correspondance, statistiques sur les prises.

RECREATIONAL MAIL SURVEYS, 1988 TIDAL SPORTFISHING DIARY PROGRAM AND VISITORS SPORTFISHING SURVEY

## INTRODUCTION

The Tidal Sportfishing Diary Program is a mail survey of resident B.C. tidal water anglers. The Diary Program was introduced in 1979 as a method of estimating recreational catch and effort. It was necessary to survey large numbers of B.C. adults in order to contact anglers in the absence of a licencing program. The B.C. Tidal Waters Sport Fishing Licence, introduced during 1981, identified anglers and provided a sample base for the program beginning in 1982. The licences also provide a sample base for anglers visiting B.C. The Visitors Sportfishing Survey was first conducted in 1982 to obtain estimates of sport catch and expenditures by anglers visiting B.C. during the previous year. The 1981 and 1982 licence years corresponded to calendar years (January 1 to December 31). The 1983 licence year was a transition from a calendar year to a fiscal year (April 1 to March 31) and extended from January 1, 1983 to March 31, 1984. The 1983 Diary program and Visitors Survey covered the entire 15 month period although only the 1983 calendar year statistics were published. The 1988/89 population and catch and effort statistics correspond to the 1988/89 licence year (April 1, 1988 - March 31, 1989).

## METHODOLOGY

A systematic sample of 37,000 1987/88 B.C. Tidal Waters Sport Fishing Licences was drawn. The licence information was keyed directly from the licence stubs into a computer to produce an address list. The B.C. addresses were used for the Diary Program while the remainder were used for the Visitors Sportfishing Survey.

## Tidal Sportfishing Diary Program

In 1988/89, the Diary Program was conducted as follows: semi-monthly, a new sample or panel of 1,400 licence holders was mailed a diary form covering a full "month". Half of the panels were responsible for recording fishing activity for a calendar month, the other half for an interval from the middle of one month to the middle of the next. Data for the first half of the "month" was filled in from memory; data for the second half was filled in as anglers fished. Diarists were provided with addressed postage paid envelopes for returning the survey forms. Drawings of the 5 salmon species and lingcod, rockfish and halibut were included to aid identification. Reminders were sent to all panel members at the end of the "month".

The data from returned diaries was entered into a computer. A program checked the data during entry to prevent duplicate entries and to ensure that the areas, months, types of fishing and daily catches were valid. Invalid information was not used for estimation of catch and effort. Diaries received more that one month after the last date of the diary "month" were considered to be late and were not used.

## Visitors Sportfishing Survey

Three thousand questionnaires were sent to visiting North American anglers (excluding B.C.) at the end of the licence year. Reminders were sent to questionnaire nonrespondents four weeks after the initial sendout. Questionnaire recipients were asked about their fishing activity in B.C. during the 1988/89 licence year.

The data from returned surveys was entered into a computer. A program checked the data during entry to prevent duplicate entries and to ensure that the areas, months, and daily catches were valid. Invalid information was not used for estimation of catch and effort. Surveys received more that one month after the reminder sendout were considered to be late and were not used.

## RESULTS

## Returns

The number of diary returns for each panel of the 1988/89 Diary Program is provided in Table 1. The percentage of anglers returning diaries and fishing during each diary period varies throughout the year, as shown in Table 1. During the entire year, $53 \%$ of the anglers contacted returned diaries. Thirteen percent of those returning diaries actually fished. Some anglers returned letters containing objections to the new chinook conservation tags in lieu of their diaries. It was feared that opposition to the tags would affect the response to the diary program. This does not seem to be the case as the response rate is similar to that obtained in other years (Table 2).

Three thousand questionnaires were sent out for the 1988/89 Visitors Survey. The return rate for the Visitors Survey was $72 \%$.

## Resident Sportfishing Population

The estimated number of B.C. resident adult anglers in 1988/89 is provided in Table 3. The population is estimated using the proportion of B.C. anglers in the licence sample and the total licence sales. The population consists of adult B.C. resident tidal water anglers, aged 16 and over. Characteristics of the population of licence holders can be estimated from the sample. Males account for $80 \%$ of the population of licence holders while females account for $20 \%$ (Figure 1). The population of B.C. adults, by comparison, is composed of almost equal numbers of males and females (Statistics Canada 1988).

The age composition of the B.C. adult population is presented in Figure 2. The proportion of individuals between 26 and 54 years of age is higher among licenced anglers than among B.C. adults in general. More young adults and people 55 years of age and over are present in the total population of adults (Statistics Canada 1988).

ESTIMATED POPULATION OF B.C. RESIDENT ANGLERS

| Year | Number of <br> Anglers |
| :--- | ---: |
| 1981 | 203,000 |
| 1982 | 223,000 |
| $1983 / 84$ | 224,000 |
| $1984 / 85$ | 225,000 |
| $1985 / 86$ | 239,000 |
| $1986 / 87$ | 242,000 |
| $1987 / 88$ | 240,000 |
| $1988 / 89$ | 237,000 |

The distribution of B.C. licenced anglers by area of residence is presented in Figure 3. Over $75 \%$ of licenced anglers are from Vancouver Island and the Greater Vancouver area. Eight percent of B.C. adults purchased a Tidal Waters Sport Fishing Licence in 1988. As expected, this percentage was higher in coastal areas as shown in Figure 3.

## Population of Visiting Anglers

The estimated number of anglers visiting B.C. in 1988/89 is presented in Table 4. The sex composition of the population of visiting anglers is similar to the composition of B.C. resident anglers. Males account for $78 \%$ of the visiting population and females account for 22\%.

The age composition of the population of visiting anglers is presented in Figure 2. The proportion of individuals over the age of age 45 is higher among visiting anglers than among B.C. resident anglers.

Americans accounted for $65 \%$ of the visiting anglers while Canadians accounted for $31 \%$. The remaining $4 \%$ of the visiting anglers originated from outside North America. The proportions of visiting anglers by country of origin are presented in Figures 4 and 5.

## Catch

British Columbia resident and visiting angler catches are presented in Table 5 and Table 6, respectively. The combined catch by B.C. resident and visiting anglers is presented in Table 7.

Most of the salmon were caught between Vancouver Island and the mainland. This area accounted for $89 \%$ of the total salmon, including $66 \%$ of the chinook and $96 \%$ of the coho caught and kept by B.C. resident anglers in 1988/89. This area contributed a smaller proportion ( $75 \%$ ) of the total salmon caught by visiting anglers.

Over $70 \%$ of the rockfish and lingcod caught by residents were taken from waters between Vancouver Island and the mainland. About $60 \%$ of the lingcod and the rockfish caught by visitors were taken from this area. Forty percent of the halibut caught by B.C. residents were taken from waters north of Vancouver Island. Sixty percent of the halibut catch by visitors was taken from waters west of Vancouver Island.

[^2]
## Effort

British Columbia resident anglers fished an estimated 1.2 million days in 1988/89. Visiting anglers fished an estimated 495,000 days in B.C. tidal waters in the 1988/89 licence year, bringing the total tidal water estimate of effort to 1.72 million days during the 1988/89 licence year. More than $90 \%$ of the finfish effort by B.C. resident anglers occurrs from boats. Most of the combined effort ( $82 \%$ ) by residents and visitors occurs between Vancouver Island and the mainland.

## Catch and Effort by Juvenile Anglers

A Tidal Waters Sport Fishing Licence for juvenile anglers, age 15 and under) was introduced as part of the 1988/89 licence system. The population of juvenile anglers by residence can be estimated from juvenile licence sales and a sample of licences providing residence information. In 1988/89, there were 44,900 B.C. juvenile anglers and 9,500 visiting juvenile anglers, estimated using licence sales and sample information.

Other surveys (Cox 1977; Cumming 1979; Pelletier, Lacasse and Ducharme 1981; Thomson 1974) indicate that the average number of days fished by resident juvenile anglers is one-third to two-thirds the average number of days fished by their adult counterparts. Juvenile resident effort is estimated using the assumption that each juvenile resident angler fishes half as many days as an adult resident.

Results of previous Visitors Surveys (James 1986, James 1985) indicate that the majority of visiting anglers come to the province to fish or for a vacation. Juvenile visiting anglers would probably be members of families on fishing trips or vacations. These juveniles would be more likely to fish than would resident juveniles. The assumption is, therefore, that visiting juveniles fish proportionally more than resident juveniles but less than visiting adults. It is assumed that visiting juveniles fish $75 \%$ the number of days fished by visiting adults.

The catch by juvenile anglers is estimated to be the effort by juvenile anglers multiplied by the catch rates for adult anglers. It is assumed that juvenile anglers generally fish with and are assisted by adults so the catch rates are equal. The catch and effort for juvenile anglers is presented in Table 9. These numbers are not included in the previously discussed catches by adult anglers.

## DISCUSSION

## Nonresponse Bias

Certain types of error are associated with any type of survey. One type of error is referred to as nonresponse and results from the failure to measure or contact the entire survey sample (Cochrane 1977). Biased measurements could be obtained if the characteristics of the measured group differ from the group that was not measured. Individuals that voluntarily return questionnaires as part of a mail survey are possibly more interested in the questionnaire subject and could differ from those who don't return questionnaires. Tidal Diary respondents could be more active and successful anglers than nonrespondents. Estimates of fishing activity from this source alone could be biased upwards.

Nonrespondents were surveyed by telephone as part of the 1987/88 Diary program. Survey results indicate that $73 \%$ of the nonrespondents fished compared to $74 \%$ of the respondents. A chi-square test indicated no difference between these participation rates at the .05 level of significance. Nonrespondents reported fishing more days and catching more salmon, on the average, although these differences are not significant as indicated by t-tests at the .05 level of significance. Catch per angler day (CPUE) can be considered to be a measure of fishing success. The chinook and coho CPUE for respondents were higher but not significantly so as indicated by t-tests at the .05 level of significance. Therefore, the hypothesis that nonrespondents were as successful as the respondents was accepted.

## Recall Bias

Another source of error is recall bias that arises when individuals cannot always accurately recall details after time has passed. The result could be either under or over estimating, depending on the subject. The magnitude of the error could increase with time. This type of bias can be a problem in postseason mail surveys such as the Visitors Survey when the recall period is long. Diary program participants, however, are asked to recall the last half month only and keep records as they fish for the remainder of the month. For each half month, a recalled set of data and a current set of data are collected. Generally, the average catch and effort was higher for recalled data than for current data with the exception of other salmon, lingcod and halibut. The differences between the recalled and current data
are not significant as indicated by analyses of variance at the .05 level of significance.
Diaries received more that one month after the last date of the diary "month" are considered to be late and are not used for catch and effort estimation. The purpose of this exclusion is to eliminate information recalled over a longer period of time and reduce the possible effects of recall bias.

## Inaccurate Reporting

Error can also result from inaccurate reporting by the respondents. Drawings of the required fish with identification points were supplied to all of the diarists to assist in correct species identification. During data entry, a computer program checked the catches against valid daily limits. Catches over the limit were were not used for catch estimation because the the catch could have been identified incorrectly or the reported catch could have been for the fishing party rather than for the individual angler.
