# Canadian Manuscript Report of Fisheries and Aquatic Sciences No. 2087 

## Canadian Manuscript Report of Fisheries and Aquatic Sciences

Manuscript reports contain scientific and technical information that contributes to existing knowledge but which deals with national or regional problems. Distribution is restricted to institutions or individuals located in particular regions of Canada. However, no restriction is placed on subject matter, and the series reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Manuscript reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in Aquatic Sciences and Fisheries Abstracts and indexed in the Department's annual index to scientific and technical publications.

Numbers 1-900 in this series were issued as Manuscript Reports (Biological Series) of the Biological Board of Canada, and subsequent to 1937 when the name of the Board was changed by Act of Parliament, as Manuscript Reports (Biological Series) of the Fisheries Research Board of Canada. Numbers 901-1425 were issued as Manuscript Reports of the Fisheries Research Board of Canada. Numbers 1426-1550 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Manuscript Reports. The current series name was changed with report number 1551.

Manuscript reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

## Rapport manuscrit canadien des sciences halieutiques et aquatiques

Les rapports manuscrits contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais quitraitent de problèmes nationaux ou régionaux. La distribution en est limitée aux organismes et aux personnes de régions particulières du Canada. Il ny a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports manuscrits peuvent être cités comme des publications complètes. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports manuscrits sont résumés dans la revue Résumés des sciences aquatiques et halieutiques, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 900 de cette série ont été publiés à titre de manuscrits (série biologique) de l'Office de biologie du Canada, et après le changement de la désignation de cet organisme par décret du Parlement, en 1937, ont été classés comme manuscrits (série biologique) de l'Office des recherches sur les pêcheries du Canada. Les numéros 901 à 1425 ont été publiés à titre de rapports manuscrits de l'Office des recherches sur les pêcheries du Canada. Les numéros 1426 à 1550 sont parus à titre de rapports manuscrits đu Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 1551.

Les rapports manuscrits sont produits à léchelon régional, mais numérotés à l'èchelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

## ABSTRACT

Collicutt, L. D. and T. F. Shardlow. 1990. Strait of Georgia sport fishery creel survey statistics for salmon and groundfish, 1989. Can. MS Rep. Fish. Aquat. Sci. 2087:75p.

Catch and effort statistics for the Strait of Georgia tidal sport fishery are presented for each month in 1989. The statistics were derived by combining the data from over 31,000 interviews and 68 aerial surveys. Estimates were provided for the number of sport fishing boat trips and the catches of chinook, coho, pink, sockeye and chum salmon along with rockfish, lingcod, dogfish and other finfish. Also given are numbers of marked (adipose finclipped) and unmarked chinook and coho examined during the creel survey, the age composition of chinook and the length frequency distribution of chinook, coho and lingcod catches. The appendix includes all catch and effort statistics for each combination of month and Statistical Area.

Key words: salmon, groundfish, creel survey, sport fishing, catch, effort, age composition, length distribution.

RÉSUMÉ

Collicutt, L. D. et T. F. Shardlow. 1990. Strait of Georgia sport
fishery creel survey statistics for salmon and groundfish,
1989. Can. MS Rep. Fish. Aquat. Sci. 2087:75p.

Les statistiques sur les prises et l'effort de peche dans le cas de la pêche sportive dans les eaux à marée du détroit de Gérgie sont présentées pour chaque mois de 1989. Les statistiques ont été établies en réunissant les données de plus de 31000 entrevues et de 68 levés aériens. Des estimations ont été fournies pour le nombre de sorties des bateaux de pêche sportive ainsi que le nombre de prises de saumon quinnat, de saumon coho, de saumon rouge et de saumon kéta avec des sébastes, des morues-lingues, des aiguillats et autres poissons. on indique également le nombre de saumons quinnat et coho marqués (nageoire adipeuse coupée) et non marqués examinés dans le cadre de l'enquête sur la pêche sportive, ainsi que la composition par age et la répartition par longueur des prises de saumon quinnat. L'annexe comprend toutes les statistiques sur les prises et l'effort de peche pour chaque combinaison de mois et de zone statistique.

Mots-clés : saumon, poisson de fond, enquête de pêche sportive, prises, effort, composition par âge, distribution de longueur.

### 1.0 INTRODUCTION

This report documents the 1989 catch and effort statistics for the Strait of Georgia sport fishery and presents methodology for collecting these data. During the 1970s, the sport fishery grew to be the largest harvester of chinook and coho salmon in the Strait of Georgia. Figure 1 and Table 1 show historical catch statistics for the Strait of Georgia sport fishery for the period 1960-1989. In the late 1970s, fisheries managers recognized the need for accurate catch statistics. In 1980, the Strait of Georgia Creel Survey Program was initiated to meet the need for accurate and timely sport catch statistics primarily for chinook and coho. Since then, the objectives of the Creel Survey Program have been expanded to provide accurate catch estimates for all major sport-caught finfish, age composition of chinook catches and length distribution of chinook, coho and lingcod catches. This report is one of a series of Strait of Georgia Creel Survey Reports which document annual creel survey activities and estimation procedures, and provide official published Strait of Georgia tidal sport fishery catch statistics.

In 1989, the creel survey gathered a complete set of annual sport fishing data for the Strait of Georgia. There were no project interruptions, and interview and overflight data were collected on a continuous basis throughout the year.

In this report, all figures, tables and appendices are located at the end of text.

### 2.0 METHODS

The Strait of Georgia Creel Survey is comprised of two independent surveys: angler interviews and aerial overflights. Angler interviews provide data on sport fishing catch per unit effort (CPE) and daily activity patterns. Aerial overflights provide estimates of the total sport fishing effort in the study area at the time of the aerial survey. These data are combined to provide monthly estimates of total sport fishing effort and total catch of salmon and groundfish in the sport fishery. In its simplest form, the estimated total catch is calculated by multiplying the estimated total effort by catch per unit effort.

The design of the Strait of Georgia Creel Survey conducted in 1989 was similar to that used by DPA Consulting Ltd. (1982) with some modifications to the data analyzed, sampling intensity, flight routes and data processing. Sampling was conducted during each month of the year and estimates were produced for 10 time periods. The January and February data were grouped together, as were the November and December data because of reduced fishing activity and sampling in these winter months. Mid-week days and weekend days were considered independently because sport fishing activity is known to differ markedly for the two types of days. The Strait of Georgia study area (defined in

Appendix C) was stratified by geographic region. Catch and effort statistics were produced for each of the 10 Statistical Areas within the Strait of Georgia (Areas $13-19 \mathrm{~A}, 19 \mathrm{~B}+, 28$ and 29, where Statistical Area 19B + includes the portion of Area 20 east of Sheringham Point) (Fig. 2). Appendix C provides a complete description of the study area. Data collection, entry and preliminary processing were conducted by LGL Ltd. environmental research associates. Estimation of the catch and effort statistics was conducted by the Department of Fisheries and Oceans.

### 2.1 FIELD SURVEYS

### 2.11 Angler Interviews

Sport fishermen were interviewed at the end of their fishing trip to determine the time spent fishing, the locations fished and the catch of each species on the trip. Demographic information was also collected during each interview. Figure 3 shows the interview form used in 1989.

Interviewers trained in fish identification inspected each boating party's catch. Unlike other methods of collecting sport fishery information, such as mail-in or telephone surveys, this approach to determining sport fishery catch resulted in no memory-related recall bias, non-response bias, or fish identification concern. Landed chinook and coho were checked for a missing adipose fin which indicates the presence of a coded wire tag embedded in the fish nose cartilage. In addition, scale samples for age determination and measurements of nose-fork length were taken during every sampling shift. Five scales were removed from the INPFC (International North Pacific Fisheries Commission) preferred area of each biosampled chinook (Mosher 1968).

In 1989, the interviews were conducted each month at a maximum of 46 of the 50 designated landing sites (boat ramps, marinas, or resorts, Appendix C) representative of the sport fishing activity in each Statistical Area. The number of sites selected in each area was dictated by targets of desired precision and number of surveyors available. For each area day type - work block stratum, sampling shifts at a site were chosen on a near random basis from the total number of shifts available. For definition of the above terms (day type, work block, shift) see Appendix A.

### 2.12 Aerial Overflights

Aerial surveys, conducted from float planes travelling along pre-defined routes, allowed observers to count vessels actively sport fishing throughout the Strait of Georgia. Planes flew at an altitude of 500-700 feet to facilitate a broad range of vision and still allow easy identification of vessel characteristics. Each plane carried three observers, two on the
right side and one on the left, and each observer counted sport fishing boats to his/her side of the flight path. Figure 2 shows the flight paths used in 1989. The winter (October April) flight path was slightly reduced to correspond with the lower winter effort.

The flight path and time of departure were designed to cover major concentrations of sport fishing activity at peak periods. Whenever possible, the route was flown to keep most of the sport fishing boats to the right side to allow averaging of the two right side counts. To maximize precision, flying times during which fishing effort was rapidly changing were avoided. The number of overflights each month was governed by targets of desired precision and by the expected number of interviews from a given number of sampling shifts (English et al. 1986). The days for overflights during a month were randomly selected for each day type.

### 2.2 DATA ANALYSIS

Data analysis included calculation of catch and effort statistics, calculation of variance of total fishing effort and total catch, estimation of marked chinook and coho salmon, estimation of age and length composition of chinook catch and length frequency distribution of coho and lingcod catch. Appendix A details the methods and equations used in the above data analysis.

### 3.0 RESULTS

### 3.1 DISTRIBUTION OF SAMPLING EFFORT

Table 2 shows the number of creel survey interviews conducted with anglers who had been actively fishing by month and Statistical Area in 1989, and the number of monthly overflights. A total of 31,382 interviews, of which 24,763 involved actively fishing anglers, and 68 overflights were conducted in 1989. Figure 4 shows that the monthly distribution of interviews generally reflected the monthly distribution of fishing effort (number of boat trips, Table 3). Interview effort was reduced during winter months, especially for Statistical Areas 13, 14 and 15 in the northern portion of Strait of Georgia (Table 2). The total interviews represent $5.2 \%$ of the estimated total fishing effort for the entire study area ( 603,331 boat trips, Table 3). The interviews involving actively fishing anglers represent $4.1 \%$ of the total fishing effort and ranged in each Statistical Area from a low of $1.4 \%$ of the estimated fishing effort in Area 18 to a high of $7.6 \%$ in Area 28 (Tables 2 and 4).

### 3.2 SPORT FISHING EFFORT AND CATCH

The 1989 Strait of Georgia sport fishing effort and catch statistics are summarized
for each species by month in Table 3 and by Statistical Area in Table 4. Appendix B shows the fishing effort and catch statistics by species for each combination of month and Statistical Area.

Sport fishermen made 603,331 boat trips during 1989 which is comparable to the fishing effort in recent years (Fig. 1, Table 1). The fishing effort in 1989 followed the same general seasonal pattern as seen in previous years (Table 3, Fig. 5). Effort levels climbed steadily from April, peaked in July and August, and declined rapidly in September and October.

The total finfish sport catch in the Strait of Georgia in 1989 was estimated at $1,088,680$ pieces (including steelhead and cutthroat trout, Table 3) and consisted of $71 \%$ salmon and $29 \%$ groundfish. An additional 1,201,306 salmon of mixed species were released by anglers (Appendix B-8). Salmon and groundfish catches are discussed below.

### 3.21 Salmon

Salmon sport catches in the Strait of Georgia in 1989 totalled 774,290 pieces (Tables 3 and 4 ) and consisted of $64 \%$ coho, $17 \%$ chinook, $16 \%$ pink salmon, $2 \%$ sockeye and $1 \%$ chum salmon.

For the first time since 1984, chinook sport catches showed a slight increase over the previous year. Anglers took 132,846 chinook in 1989 (Tables 3 and 4), compared to 119,117 in 1988 and 121,081 in 1987 (Fig. 1, Table 1). Monthly chinook catches showed an extended catch peak from May through August (Fig. 6, Table 3). Seasonal catch efficiency for chinook in 1989 showed reduced levels similar to those in 1987 and 1988, averaging 0.2 fish per boat trip and peaking in the winter months at 0.7 fish per boat trip (Fig. 7, Table 5).

The continued low chinook catch and the reduced catch efficiency were probably a result of a continued low abundance of this species and, to a lesser extent, the new sport fishery regulations (see below).

A number of new sport fishery regulations were introduced in 1989 that likely influenced catch levels of chinook. On January 18, 1989, the size limit was increased from 45 cm to 62 cm for the entire study area (see Appendix C for a definition of the study area). On August 16, 1989, new regulations were instituted which divided the study area into 2 distinct regulation areas. In the area extending from Cadboro Point near Victoria to Sheringham Point near Sooke, the annual bag limit of chinook was increased from 8 to 20 and the size limit was reduced from 62 cm to 45 cm . In the remaining portion of the Strait of Georgia, the annual bag limit was increased from 8 to 15 fish per year but the size limit remained at 62 cm .

The spacial distribution of chinook catch followed a similar pattern to previous years. The highest catches were taken in Area 13 ( $27 \%$ of total), Area 19B+ (25\%), and Area 14 (18\%) (Table 4, Fig. 8). In 1989, 77\% of the chinook landed during the summer months (May - September) were taken in the northern region of Strait of Georgia - Statistical Areas 13 to 17. The opposite was true in the winter months (January - April, October December) when $73 \%$ of the winter catch came from the southern region - Statistical Areas 18, 19, 28 and 29 (Appendix B-3). During November and December, many of the chinook came from Victoria/Sooke waters in Statistical Area 19B + (Appendix B-3).

The 1989 coho catch of 497,223 pieces (Tables 3 and 4) was less than half of the 1988 catch and represents the lowest coho catch recorded for this fishery since 1984 (Fig. 1, Table 1). Monthly coho catches in 1989 peaked in July which is somewhat later than in 1988 (Fig. 9). Coho catch success in 1989 reached a high of 1.5 fish per boat trip in April, and showed a secondary peak of 1.3 fish per boat trip in July (Fig. 10, Table 5). As in previous years, the highest coho catches were taken in Area 13 (31\%) and Area 14 (29\%) (Table 4, Fig. 8 ).

In 1989, Strait of Georgia anglers caught 123,046 pink salmon (Table 3). Significant pink catches were expected in 1989 because pink salmon returns to the Strait of Georgia rivers (primarily the Fraser River) are much higher in odd numbered compared to even numbered years. The highest catches were taken in Area 19B+ (65\% of total) and Area 13 (21\%) (Table 4).

The landings of other salmon consisted of an estimated 13,356 sockeye and 7,819 chum salmon (Table 3). A large portion of the annual sockeye catch ( $91 \%$ of total) was taken in Areas 19B+, 28 and 29 during July to September (Appendix B-5). Most of the annual catch of chum salmon ( $71 \%$ of total) was taken in Area 13 during September and October (Appendix B-6).

In addition to the above salmon species, an estimated 1,326 steelhead, cutthroat trout and unidentified salmon were caught in the Strait of Georgia in 1989, bringing the total salmonid catch to 775,616 pieces (Appendix B-7).

The average number of salmon caught during each boat trip in 1989 was 1.28 (Table 5). As seen below, this represents the lowest catch success for salmon recorded since 1984.

| Year | Catch Success | Reference |
| :---: | :---: | :--- |
| 1984 | 1.27 | Shardlow and Collicutt (1989 a) |
| 1985 | 1.69 | Shardlow and Collicutt (1989 b) |
| 1986 | 1.30 | Shardlow and Collicutt (1989 c) |
| 1987 | 1.47 | Shardlow and Collicutt (1989 d) |
| 1988 | 1.86 | Shardlow and Collicutt (1989 e) |
| 1989 | 1.28 | This report |

In 1989, Areas 14 and 13 showed the highest effort expended while Areas 13 and $19 \mathrm{~B}+$ showed the highest total salmon landed (Fig. 11, Table 4). Boaters fishing in Areas 13 and $19 \mathrm{~B}+$ had an average catch of 1.7 and 2.0 salmon per trip respectively (Table 4). Area 14 recorded the greatest number of salmon hooked and released $(395,227)$ with Area 13 next at 261,336 (Appendix B-8). These two areas have major coho fisheries characterized by the release of many sub-legal coho.

### 3.22 Groundfish

While salmon accounted for the majority of the total finfish sport catch in the Strait of Georgia in 1989, the groundfish catch of 313,064 pieces made up $29 \%$ of the overall catch (Tables 3 and 4). The species composition of the groundfish catch, based on the Table 4 data, was as follows:

| Groundfish | Catch | $\%$ of Total <br> Groundfish <br> Catch | Major <br> Catch |
| :--- | :---: | :---: | :---: |
| Species | 199,898 | $64 \%$ | 16 |
| Rockfish (Sebastes spp.) | 52,329 | $17 \%$ | 13 |
| Lingcod (Ophiodon elongatus) | 3,672 | $1 \%$ | 29 |
| Dogfish (Squalus acanthias) | 57,165 | $18 \%$ | 18 |
| Other finfish (Appendix D) |  | $100 \%$ |  |
|  |  |  |  |

The majority of the groundfish catch was taken in the summer months, reflecting the seasonal change in fishing effort (Table 3, Fig. 4). Catch by Statistical Area for rockfish was highest in Area 16 ( $24 \%$ of total, Table 4). Lingcod, as in previous years, were caught in greatest numbers in Area 13 ( $40 \%$ of total), while the largest dogfish catch came from Area $29(28 \%$ of total, Table 4). Area 18 produced the largest catch of other finfish ( $29 \%$ ).

Rockfish species were identified for the entire survey area again in 1989 (Table 6). Applying the identification results to the 1989 rockfish catch estimates by area (Table 4) showed the catch by species and area (Table 7). The results are summarized below.

| Rockfish <br> Species | Catch | \% of <br> Rockfish <br> Catch | Major <br> Catch <br> Area |
| :--- | :---: | :---: | :---: |
| Quillback | 66,510 | $33 \%$ | 16 |
| Copper | 37,665 | $19 \%$ | 18 |
| Yelloweye | 10,272 | $5 \%$ | 14 |
| Black | 3,258 | $2 \%$ | $19 \mathrm{~B}+$ |
| Other | 82,193 | $41 \%$ | 16 |
| Total | 199,898 | $100 \%$ |  |

The above "other" rockfish category consisted of tiger, yellowtail, china, canary and unidentified species.

The catch success (CPE) for rockfish was relatively constant throughout the year and averaged 0.3 fish per boat trip, while the catch success for lingcod was 0.1 fish per boat trip (Table 5). The catch success for all non-salmon species and for total finfish during 1989 was 0.5 and 1.8 fish per boat trip respectively (Table 5).

### 3.3 BIOLOGICAL DATA

### 3.31 Proportion and Catch of Marked Chinook and Coho

In $1989,5,674$ chinook and 18,801 coho were examined for adipose fin clip marks. Tables 8 and 9 show for chinook and coho respectively, the number of marks observed and
the total fish inspected by month and region. The data were presented by region since some Statistical Areas had insufficient numbers of fish examined for marks in some months, and those data were included with other Areas. Three regions were defined: the North Gulf represented by Areas 13-16; the South Gulf represented by Areas 17, 18, 28, 29 and the Saanich Inlet portion of Area 19 (Area 19A); and the Victoria region represented by the remainder of Area 19 (Area 19B+) (Fig. 2).

Among chinook examined for marks, $4.6 \%$ had adipose fin clips. The largest observed proportion of chinook marks was in the South Gulf catch (0.051) and the lowest proportion in the North Gulf catch (0.043) (Table 8). Among coho examined for marks, $5.4 \%$ had adipose fin clips. The largest observed proportion of coho marks was in the South Gulf catch (0.069), and the lowest proportion in the Victoria catch (0.039) (Table 9). As in 1988, the above distribution of tags by area was not typical. For example, the largest observed proportion of chinook marks recorded in 1989 was in the South Gulf (Table 8) instead of the North Gulf as reported in 1984 to 1987 (Shardlow and Collicutt 1989 a, b, c and d). Monthly catch estimates of marked chinook and coho are shown by region in Tables 10 and 11 respectively. The seasonal recovery pattern of marked chinook and coho salmon was generally similar to that observed in previous years (Shardlow and Collicutt 1989 b, c and d).

### 3.32 Catch-At-Age for Chinook

During 1989, 1,567 chinook biosamples were collected for age and length analysis. More samples were collected in 1989 than in previous years because sampling took place during every shift instead of every second shift. Table 12 shows the monthly number and percent age composition of chinook sampled for age. All ages shown in this report represent the total age (freshwater age plus saltwater age). The age data are summarized graphically in Figure 12. The monthly age proportions were applied to the estimated monthly chinook catches to provide a breakdown by age group (Table 13). In 1989, the chinook sport catch in the Strait of Georgia consisted primarily of age 3 fish ( $83.3 \%$ ), followed by age 4 fish ( $10.5 \%$ ). The age 2 and age 5 or older fish each made up $3.1 \%$ of the total. This catch breakdown by age group is similar to the 1985 to 1987 catch data where the majority of chinook caught were age 3 , and only a small fraction were age 2 (see below).

|  | \% Age Composition of Chinook |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :--- |
| Catch <br> Year | 2 | 3 | 4 | $5+$ | Reference |
| 1983 | 57.1 | 25.5 | 14.2 | 3.1 | Shardlow et al. (1989) |
| 1984 | 21.6 | 67.3 | 9.4 | 1.7 | Shardlow and Collicutt (1989 a) |
| 1985 | 6.6 | 70.8 | 20.6 | 2.0 | Shardlow and Collicutt (1989 b) |
| 1986 | 10.9 | 44.9 | 40.4 | 3.8 | Shardlow and Collicutt (1989 c) |
| 1987 | 7.8 | 62.1 | 25.0 | 5.2 | Shardlow and Collicutt (1989 d) |
| 1988 | 26.4 | 35.3 | 35.4 | 2.8 | Shardlow and Collicutt (1989 e) |
| 1989 | 3.1 | 83.3 | 10.5 | 3.1 | This report |

The strong age 3 component in 1989 was likely a result of a strong brood year and the influence of the increased size limit (from 45 cm to 62 cm ) which eliminated most age 2 chinook from the catch.

Figure 12 and Table 12 show a minor shift in the age composition of sampled chinook, and hence of chinook catch, as the year progressed. Age 3 fish were the dominant component of the catch in all months, with minor peaks of age 4 fish observed from April to June and age 2 fish from September to December.

### 3.33 Mean Length-At-Age for Chinook

Table 14 shows the monthly mean nose-fork length at age for the 1,567 chinook for which both length and age data were available. Figure 13 shows the length frequency distribution for all the measured chinook (2,075 aged and unaged fish). The largest portion of measured chinook ( 958 fish or $46 \%$ of the total sample) was in the $62-71 \mathrm{~cm}$ length category (the basis for using these size categories was the new 62 cm size limit). This is consistent with the large catch of age 3 fish (Table 13) which were found to have an annual mean length of 64.5 cm (Table 14). Of the total chinook measured in 1989 in the new Victoria regulation area, $2 \%$ ( 15 out of 693 sampled fish) were sub-legal in size (less than 45 cm ). In the rest of the Strait of Georgia, $20 \%$ ( 281 out of 1382 sampled fish) were sublegal (less than 62 cm ). By comparison, only $2-3 \%$ of the chinook captured during the 1985 to 1987 surveys were sub-legal (Shardlow and Collicutt 1989 b, c and d). The large number of sub-legal fish observed in the 1989 survey may be attributed to the new 62 cm size limit introduced in much of the survey area. The largest chinook sampled ( 112.5 cm ) was a 4 year old fish landed at Pedder Bay Marina in Area 19 on July 19, 1989.

### 3.34 Length Frequency Distribution for Coho

Figure 14 shows the length frequency distribution for coho sampled in 1989. Coho length frequency data were omitted in previous reports (1986-1988) and are presented here for comparison (Fig. 15). In 1989, the largest proportion of measured coho (2,862 fish or $42 \%$ of the total sample) was in the $50-59 \mathrm{~cm}$ length class. This is similar to previous years when $60 \%, 55 \%$ and $53 \%$ ( 1986 to 1988 respectively) of the measured coho were in this size class. The observed trend of a decreasing proportion of fish in the $50-59 \mathrm{~cm}$ size class coincides with an increasing proportion of coho in the $40-49 \mathrm{~cm}$ size class $(21 \%, 28 \%, 37 \%$ and $34 \%$ for 1986 to 1989 respectively). The overall decline in the mean length of coho measured in the creel survey is shown below.

| Year | Mean Length <br> $(\mathrm{cm})$ | Sample Size |
| :---: | :---: | :---: |
| 1986 | 53.4 | 5,354 |
| 1987 | 50.5 | 4,997 |
| 1988 | 50.0 | 13,000 |
| 1989 | 49.6 | 6,883 |

This decline does not appear to be associated with a shift of fishing effort to early spring coho fisheries (Fig. 5).

### 3.35 Length Frequency Distribution for Lingcod

Figure 16 presents the length frequency distribution for lingcod sampled in 1989. The length frequency data were omitted in previous reports (1985-1988) and are shown here for comparison (Fig. 17). In 1989, the largest proportion of measured lingcod (138 fish or $39 \%$ of the total sample) was in the $50-59 \mathrm{~cm}$ length class. This is similar to previous years when $37 \%, 42 \%, 39 \%$ and $39 \%$ (1985 to 1988 respectively) of the measured lingcod were in this length class.

### 3.4 BIAS AND ERROR INVESTIGATIONS

In 1989, three projects were undertaken as part of an investigation into potential sources of error and bias in the Strait of Georgia Creel Survey program. The results of two
of these investigations involving data entry errors and early morning fisheries, are summarized below. The third project, involving site selection bias, is still in progress.

### 3.41 Data Entry Errors

In order to quantify the level of error involved in entering the creel survey interview data, the original interview forms were compared with the key-punched data. The keypunch operator had no prior knowledge that this error check was being made. July 1989 was chosen as one of the busiest months for data entry. Approximately 16 interviews per site were chosen randomly from 39 sites for a total of 618 interviews or $10.9 \%$ of the total 5,671 interviews key-punched for July. The original data forms were then manually compared to the data in the computer key-punch file. Any errors found were logged and the type of error noted.

Of the 618 interviews checked, seven ( $1.1 \%$ ) had errors. Only one error (improperly coded "number of released chinook") was of a type that could affect catch and release estimates. The other six errors were minor and involved either the date or the interviewer identification code. Based on the above results, it appears that data entry errors are few in number and generally of a type which would have no effect on catch estimates.

### 3.42 Early Morning Fisheries

To investigate reports of early morning fisheries (boaters landing before the regular start time of 7 a.m. for the creel survey summer shift), a total of 42 shifts from 5 a.m. to 7 a.m. were completed at eight different sites during July and August, 1989. The results are summarized below.

|  | Area | No. <br> shifts | No. Boats <br> Returning At <br> $5-7$ a.m. | No. Boats <br> Returning During <br> Regular Shifts |
| :--- | :---: | :---: | :---: | :---: |
| Site | 13 | 6 | 0 | 123 |
| Campbell River Boat Rentals | 13 | 7 | 0 | 95 |
| Freshwater Marina | 14 | 2 | 1 | 46 |
| Bowser Bill's | 17 | 6 | 0 | 142 |
| French Creek Ramp \& Marina | 17 | 7 | 1 | 122 |
| Brechin Point Ramp | 19 | 5 | 0 | 256 |
| Pacific Lions Marina | 19 | 6 | 0 | 267 |
| Pedder Bay Marina | 19 | 3 | 0 | 173 |
| Sooke Harbour Marina |  | 42 | 2 | 1,224 |

Two boats landed between 5 a.m. and 7 a.m. during the 42 early morning shifts sampled. Of these two boats, one was not fishing and the other had no catch to report. It appears from these data that although anglers go out fishing very early in the morning, almost none ( 2 of 1,224 or $0.2 \%$ ) actually return before 7 a.m.

### 4.0 SUMMARY

A sport fishery creel survey was conducted in the Strait of Georgia in 1989 in order to estimate the catches of all the important recreational finfish species and the total sport fishing boat trips. The numbers of chinook and coho salmon with adipose fin clips were also estimated. These data are presented by month and Statistical Area. The age composition of chinook and the length frequency distributions of chinook, coho and lingcod are also shown.

In 1989, sport fishermen made an estimated 603,000 boat trips in the Strait of Georgia. A total of 31,382 boating parties, of which 24,763 were actively fishing, were interviewed at a monthly maximum of 46 landing sites in the Strait of Georgia Creel Survey area. This sampling represents approximately $5 \%$ of the total number of boat trips conducted by sport fishermen in the Strait of Georgia in 1989. A total of 68 overflights were also conducted to take "snapshot" counts of fishing effort.

In 1989, sport fishermen in the strait of Georgia landed an estimated total finfish catch of $1,089,000$ pieces of which $71 \%$ were salmon and $29 \%$ were groundfish. The 774,000 landed salmon consisted of 497,000 coho, 133,000 chinook, 123,000 pink salmon, 13,000 sockeye and 8,000 chum salmon. An additional $1,201,000$ salmon of mixed species were released by anglers.

The 313,000 landed groundfish consisted of 200,000 rockfish, 52,000 lingcod, 4,000 dogfish and 57,000 other finfish. Rockfish catches were identified as quillback ( $33 \%$ of rockfish catch), copper ( $19 \%$ ), yelloweye ( $5 \%$ ) and black ( $2 \%$ ); the remaining $41 \%$ of the rockfish catch consisted of tiger, yellowtail, china, canary and unidentified species.

Catch success per boat trip averaged 1.3 salmon (all species) and 0.5 groundfish.
Among salmon examined for marks, $4.6 \%$ of chinook and $5.4 \%$ of coho had adipose fin clips. The majority of chinook sport catch in 1989 consisted of age 3 fish ( $83.3 \%$ ), followed by age $4(10.5 \%)$ and age 2 and 5 or older ( $3.1 \%$ each). Of the total chinook measured in 1989, $2 \%$ were sub-legal in size (less than 45 cm ) in the new Victoria regulation area and $20 \%$ were sub-legal in size (less than 62 cm ) in the remaining portion of the Strait of Georgia. Of the coho and lingcod sampled for length, the largest proportion for both species was in the $50-59 \mathrm{~cm}$ size class.

### 5.0 ACKNOWLEDGMENTS

The authors wish to thank the creel survey staff of LGL Ltd., particularly Karl English, Gary Searing and Jill Peterson, and private marina and boat ramp owners for their valuable assistance and cooperation. We also thank Alice Fedorenko for editing the report and assisting in preparing it for publication, and Peggy Sutherland and Louise Naylor for typing portions of the manuscript.

* A total closure for lingcod was in effect from January 1 to April 15, and November 15 to December 31. Reported figures most likely represent illegal catches by anglers.
** In addition, an estimated 1,326 steelhead, cuthroat trout, and unidentified salmon were caught by sport fishermen.

## APPENDIX A

## METHODS AND EQUATIONS USED IN ANALYSIS OF CATCH AND EFFORT STATISTICS FOR THE STRAIT OF GEORGIA SPORT FISHERY CREEL SURVEYS, 1983-1989

## ${ }^{1}$ Adapted from:

Shardlow, T. F., K. K. English, T. Hoyt, G. E. Gillespie and T. A. Calvin. 1989. Strait of Georgia Creel Survey sport fishery statistics, 1983. Can. MS Rep. Fish. Aquat. Sci. 1872 : 53 p.

APPENDIX A. Methods and equations used in analysis of catch and effort statistics for the Strait of Georgia sport fishery creel surveys, 1983-1989.

The description of terms, variables and subscripts used in the data analysis is given in Table A-1.

## Calculation of Catch and Effort Statistics

To estimate the monthly catch and effort, three components had to be calculated from that month's data:
(1) the weighted mean daily fishing pattern from interview data, (2) the weighted mean catch per unit effort from interview data and (3) the mean sport count from overflight data.

The equations used to estimate the means and variances for all catch and effort statistics are shown below.

Weighting factors used to estimate the daily fishing activity pattern and mean catch per unit effort were calculated using the equations derived from DPA Consulting Ltd. (1982).

The data obtained from each shift were multiplied by the following weighting factor (W1) to expand for all possible stints at each site. The formula reads:

$$
\begin{equation*}
W 1_{d i j}=\frac{N_{d}}{n_{d i j}} \tag{1}
\end{equation*}
$$

where $N_{d}$ is the total number of days of type $d$ in that month and $n_{d i j}$ is the number of times the jth work block at the ith site was sampled on type d days.

The interviews aggregated by work block were multiplied by the weighting factor W2 to expand for all boats that landed in each work block. The formula reads:

$$
\begin{equation*}
W 2_{d i j k}=\frac{L_{d i j k}}{I_{d i j k}} \tag{2}
\end{equation*}
$$

Table A-1. Description of terms, variables and subscripts used in this report.

## DESCRIPTION OF TERMS

| A | - | Number of boats actively fishing |
| :--- | :--- | :--- |
| B | - | Number of boats observed on a flight |
| C | - | Catch |
| C | - | Catch of marked salmon |
| CPE | - | Catch per boat trip |
| E | - | Effort (estimated total number of boat trips) |
| I | - | Number of boats interviewed and found to have been fishing |
| L | - | Number of boats landing |
| n | - | Number sampled |
| N | - | Population size from which $n$ samples were observed |
| P | - | Proportion |
| T | - | Number of boat trips |
| $V$ | - | Number found to be marked |
| W1 | - | Weighting factor to expand for all possible stints at each site |
| W2 | - | Weighting factor to expand for all boats that landed in each work |

DESCRIPTION OF SUBSCRIPTS

| a | - | age |
| :--- | :--- | :--- |
| $g$ | - | a set of landing sites |
| $d$ | - | day type |
| i | - | site |
| - | - | work block |
| $k$ | - | stint |
| i | - | landing time block |
| $m$ | - | month |
| $q$ | - | the next boat landing at site $i$ and upon interviewing, found to have been fishing (q ranges from 1 to $n$ ) |
| $r$ | - | species |
| $s$ | - | sub-Statistical Area |
| $t$ | - | time block |
| $u$ | - | filight |
| $x$ | - | region |
| $y$ | - | annual |

where $\mathrm{L}_{\mathrm{dijk}}$ is the number of boats landed and $\mathrm{I}_{\mathrm{dijk}}$ is the number of boats interviewed on the kth stint in the jth work block at the ith site on a day type d .

Therefore, the following equations can be used to calculate an unbiased estimate of the total monthly catch ( $\hat{\mathrm{C}}_{\mathrm{dgr}}$ ), fishing trips ( $\hat{T}_{d g}$ ) and fishing activity in time block ${\hat{A_{d g}}}^{\text {for }}$ each day type (d) where $g$ is a set of landing sites (i). These formulas read:

$$
\begin{gather*}
\hat{C}_{d g r}=\sum_{i} \sum_{j}\left[W 1_{d i j} \sum_{k q} \sum_{q}\left(W 2_{d i j k} C_{d i j k 1 q r}\right)\right]  \tag{3}\\
\hat{T}_{d g}=\sum_{j} \sum_{j}\left[W 1_{d i j} \sum_{k q} \sum_{q}\left(W 2_{d i j k}\right)\right]  \tag{4}\\
\hat{A}_{d g t}=\sum_{i} \sum_{j}\left[W 1_{d i j} \sum_{k q} \sum\left(W 2_{d i j k} A_{d i j k q t}\right)\right] \tag{5}
\end{gather*}
$$

where $C_{\text {dijkgr }}$ is the catch of species $r$ by the qth fishing party, and $A_{\text {dijkqt }}$ can equal 0 or 1 , thereby indicating whether the qth fishing party was actively fishing in time block $t$. Thus, the mean monthly catch per unit effort $\left(\mathrm{CPE}_{\mathrm{dgg}}\right)$ measured in terms of numbers of fish kept per completed boat trip, and proportion of daily fishing effort active during the hour of the aerial survey ( $\mathrm{P}_{\mathrm{dg}}$ ) can be calculated with the following equations:

$$
\begin{gather*}
C P E_{d g x}=\frac{\hat{C}_{d g r}}{\hat{T}_{d g}}  \tag{6}\\
P_{d g t}=\frac{\hat{A}_{d g t}}{\hat{T}_{d g}} \tag{7}
\end{gather*}
$$

where CPE $_{d g r}$ and $P_{d g t}$ are calculated for each day type (d) and group of landing sites (g). The groups of landing sites reflect geographic areas with similar catch rates and/or activity patterns.

The estimated mean number of boats fishing during the hour of the sport boat count by overflight was calculated for each sub-Statistical Area using the following equation:

$$
\begin{equation*}
\bar{B}_{d s t}=\frac{\sum_{u} B_{d s t u}}{n_{d s}} \tag{8}
\end{equation*}
$$

where $B_{\text {dstu }}$ is the number of boats observed fishing on flight $u$ at time $t$, in sub-Statistical Area s for day type d.

The mean sport boat count at the time of the overflight $\left(\bar{B}_{d s t}\right)$ and proportion of daily fishing effort active during the hour of the overflight ( $\mathrm{P}_{\text {dgt }}$ ) were used in the following equation to calculate the total fishing effort for sub-Statistical Area s on day type d :

$$
\begin{equation*}
E_{d s}=\bar{B}{ }_{d s t} \frac{1}{P_{d g t}} N_{d} \tag{9}
\end{equation*}
$$

where $N_{d}$ is the number of type d days in the month. Interview data for the sub-Statistical Areas fished (s) by anglers landing at each of the sites (i) within a landing group (g) were used to select the proportions $\left(P_{d g t}\right)$ that are appropriate for each mean boat count $\left(\overline{\mathrm{B}}_{\mathrm{dst}}\right)$.

The estimate for total effort by sub-Statistical Area and day type ( $\mathrm{E}_{\mathrm{ds}}$ ) and the weighted catch per boat trip for a group of landing sites by day type, area and species $\left(\right.$ CPE $_{\text {dgr }}$ ) were used to calculate total catch for each species ( $r$ ) and each sub-Statistical Area (s):

$$
\begin{equation*}
C_{s r}=\sum_{d}\left(E_{d s} C P E_{d g r}\right) \tag{10}
\end{equation*}
$$

The interview data were also used to select the catch per effort estimates (CPE dgr ) that should be applied to the effort estimates $\left(E_{d s}\right)$ for a specific sub-Statistical Area (s).

## Variance of Total Fishing Effort

The variance for estimates of total fishing effort has two components:
(1) the variance in aerial sport boat counts:

$$
\begin{equation*}
S_{B_{d s t}}^{2}=\frac{\sum_{u} B_{d s t u}^{2}-\frac{\left(\sum_{u} B_{d s t u}\right)^{2}}{n_{d s}}}{n_{d s}\left(n_{d s}-1\right)}\left[\frac{N_{d}-N_{d s}}{N_{d}-1}\right] \tag{11}
\end{equation*}
$$

where $B_{d s t u}$ is the aerial sport boat count at time $t$ during an aerial survey $u$ on a type $d$ day in sub-area $s$; $n_{d s}$ is the number of aerial surveys in which boats were counted on type d days, in sub-Statistical Area s; and $N_{d}$ is the total number of type d days in the months.
(2) the variance in the proportion of boats fishing during the hours of the aerial boat counts:

$$
\begin{equation*}
S_{P_{d g t}}^{2}=\frac{P_{d g t}\left(1-P_{d g t}\right)}{I_{d g}} \tag{12}
\end{equation*}
$$

where $P_{d g t}$ is the mean proportion of boats fishing for a group of landing sites $g$ during the hour of the aerial boat count $t$ on type d days, and $I_{d g}$ is the total number of sport fishing boats interviewed. The above formula assumes $\mathrm{P}_{\mathrm{dgt}}$ is unbiased and normally distributed where the number of interviews is large.

The variances for boat counts $\left(S_{\mathrm{B}_{\text {dst }}}^{2}\right)$ and proportion of boats fishing $\left(S_{p_{d g t}}^{2}\right)$ were combined in the following equation to calculate variance for effort:

$$
\begin{equation*}
S_{E_{d s}}=N^{2}\left(\frac{B_{d s t}^{2}}{P_{d g t}^{2}}\right)\left(\frac{S^{2} B_{d s t}}{B_{d s t}^{2}}+\frac{S^{2} p_{d g t}}{P_{d g t}^{2}}\right) \tag{13}
\end{equation*}
$$

where $S_{E_{d s}}^{2}$ is the variance for total effort on type d days in sub-area s, and the formula is the standard formula for the variance of a ratio of two independent random variables.

## Variance of Total Catch

The variance for estimates of total catch had two components: (1) the variance for total effort (presented above), and (2) the variance for catch per boat trip.

The variance for catch per boat trip ( $S_{\mathrm{CPE}}^{2}{ }_{\mathrm{dgr}}$ ) was calculated using the following equation:

$$
\begin{equation*}
S_{C P E_{d g r}}^{2}=\frac{S S_{C P E_{d g r}}-\frac{\left(S_{C P E_{d g r}}\right)^{2}}{I_{d g}}}{I_{d g}\left(I_{d g}-1\right)} \tag{14}
\end{equation*}
$$

where $\mathrm{SS}_{\mathrm{CPE}}^{\text {dgr }}$ is the weighted sum of squares for $C P E_{\text {dgr }}$, and $\mathrm{S}_{\mathrm{CPE}}$ dgr is the weighted sum for $C P E_{d g r}$, such that the sum of the weighting factors used to estimate CPE $_{\text {dgr }}$ was equal to the number of interviewed boat trips $\left(l_{d g}\right)$.

The variance for total effort and the variance in the catch per boat trip for the appropriately grouped landing sites were combined in the following equation to calculate variance for total catch:

$$
\begin{equation*}
S_{C_{s I}}^{2}=\sum_{d}\left(E_{d s}^{2} S_{C P E_{d g r}}+C P E_{d g r}^{2} S_{E_{d s}}+S_{C P E_{d g r}} S_{E_{d s}}^{2}\right) \tag{15}
\end{equation*}
$$

which is the standard formula for the variance of the product of two independent random variables, and where $S_{C_{s r}}^{2}$ is the variance for total number of species $r$ in sub-Statistical Area s.

## Estimation of Marked Chinook and Coho Salmon

The incidence of marked (adipose-clipped) chinook and coho was recorded in each interview. The proportion of marks observed for each region, month and species ( $P_{\mathrm{xmr}}$ ) was calculated as:

$$
\begin{equation*}
P_{x m r}=\frac{V_{x m r}}{n_{x m r}} \tag{16}
\end{equation*}
$$

where $V$ is the number of marked fish observed and $n$ is the number of fish inspected by region ( x ), month ( m ) and species ( $r$ ).

The variance of each proportion was calculated as:

$$
\begin{equation*}
S_{P_{x m r}}^{2}=\frac{P_{x m r}\left(1-P_{x m r}\right)}{n_{x m r}} \tag{17}
\end{equation*}
$$

Monthly catch estimates of marked salmon were calculated as:

$$
\begin{equation*}
C_{x m r}=P_{x m r} C_{x m r} \tag{18}
\end{equation*}
$$

where $C_{x m r}$ is the estimated catch of species $r$ in region $x$ and month $m$.
The variance of the marked catch estimates was calculated as:

$$
\begin{equation*}
S_{C_{x m r}}^{2}=P_{x m r}^{2} S_{C_{x m r}}+C_{x m r}^{2} S_{P_{x m r}}^{2}+S_{C_{x m r}} S_{P_{x m r}} \tag{19}
\end{equation*}
$$

where $S_{C_{x m r}}$ is the variance of the catch estimates of species $r$ in region $x$ and month m.

The estimate annual proportions of marked salmon caught in each region (weighted by the corresponding regional annual catch estimates) were calculated as:

$$
\begin{equation*}
P_{x r y}=\frac{\dot{C}_{x I y}}{C_{x r y}} \tag{20}
\end{equation*}
$$

where

$$
\begin{equation*}
\dot{C}_{x r y}=\sum_{m} \dot{C}_{x m r} \quad \text { and } \quad C_{X r y}=\sum_{m} C_{x m r} \tag{21}
\end{equation*}
$$

The variance of the annual proportions was calculated as:

$$
\begin{equation*}
S_{P_{X r y}}^{2}=\left(\frac{\dot{C}_{X I Y}}{C_{X I Y}}\right)^{2}\left[\frac{S^{2} \dot{C}_{X r y}}{\left(\dot{C}_{X I Y}\right)^{2}}+\frac{S^{2} C_{X r y}}{\left(C_{X I Y}\right)^{2}}\right] \tag{22}
\end{equation*}
$$

where $S_{C_{x r y}}^{2}$ is the variance of the annual estimated catch of species $r$ in region $x$.

## Estimation of Age Composition of Chinook Catch

Scale samples and length measurements were taken in a sub-sampling program during the interview process. Ages used in this report represent total age of the fish (including both freshwater and oceanic life) according to the Gilbert-Rich (1927) recording convention.

The proportion of chinook at each age and month $\left(\mathrm{P}_{\mathrm{am}}\right)$ was calculated as:

$$
\begin{equation*}
P_{a m}=\frac{a_{m}}{n_{m}} \tag{23}
\end{equation*}
$$

where $a_{m}$ represents the number of fish observed at age a during month $m$, and $\eta_{m}$ is the total number of fish bio-sampled in that month.

The variance of each proportion was calculated as:

$$
\begin{equation*}
S_{a m}^{2}=\frac{P_{a m}\left(1-P_{a m}\right)}{n_{m}} \tag{24}
\end{equation*}
$$

The catch at age of chinook in each month was calculated as:

$$
\begin{equation*}
C_{a m}=P_{a m} C_{m} \tag{25}
\end{equation*}
$$

where $\mathrm{C}_{\mathrm{m}}$ is the estimated catch of chinook salmon in a given month m .
The variance of the catch at age estimate was calculated as:

$$
\begin{equation*}
S_{C_{a m}}=P^{2}{ }_{a m} S^{2} C_{m}+C_{m}^{2} S_{P_{a m}}+S_{C_{m}}^{2} S_{P_{a m}} \tag{26}
\end{equation*}
$$

where $S_{C_{m}}$ is the variance of the month catch estimate $C_{m}$.
The annual catch at age was calculated as:

$$
\begin{equation*}
C_{a y}=\sum_{m} C_{a m} \tag{27}
\end{equation*}
$$

with a variance

$$
\begin{equation*}
S_{C_{a y}}=\sum_{m} S_{C_{a m}}^{2} \tag{28}
\end{equation*}
$$

The annual proportion at age (weighted by monthly catch) was calculated as:

$$
\begin{equation*}
P_{a y}=\frac{C_{a y}}{C_{y}} \tag{29}
\end{equation*}
$$

with a variance

$$
\begin{equation*}
S_{P_{a y}}^{2}=\left(\frac{C_{a y}}{C_{y}}\right)^{2}\left[\frac{S^{2} C_{a y}}{\left(C_{a y}\right)^{2}}+\frac{S_{C_{y}}^{2}}{\left(C_{y}\right)^{2}}\right] \tag{30}
\end{equation*}
$$

## APPENDIX B

CATCH AND EFFORT STATISTICS BY MONTH AND STATISTICAL AREA FOR THE STRAIT OF GEORGIA, 1989.

APPENDIX B-1. STRAIT OF GEORGIA FISHING EFFORT (NO. BOAT TRIPS), 1989.

| Month |  | Statistical Area |  |  |  |  |  |  |  |  |  | Total |

## APPENDIX C

APPENDIX C. Strait of Georgia Creel Survey study area.
The Strait of Georgia Creel Survey study area and landing site locations used in 1989 are shown in Figure C-1. The study area includes those waters of Juan de Fuca Strait and the Strait of Georgia bounded in the south by a line from Sheringham Pt. on Vancouver Island due south to an intersection with the International Boundary and along the International Boundary to the B.C. Mainland coast at Blaine (Boundary Bay) and in the north by the following 3 boundary lines:

1) in Discovery Passage from Granite Pt. on Quadra Island to the stream mouth west of Moriarty Pt. on Vancouver Island.
2) in Okisollo Channel from Granite Pt. on Quadra Island due north to Sonora Island.
3) in Cordero Channel from Burnt Bluff on the mainland $214^{\circ}$ passing west of Dent Island to Sonora Island.

The area for which the Strait of Georgia Creel Survey statistics apply includes the above listed administrative area with the exception of the following areas:

1) Bute Inlet above a line from Lawrence Pt. running across the inlet. This area coincides with management units 13-21 and 13-22.
2) Waters of Pryce Channel, Waddington Channel, Pendrell Sound, Homfray Channel and Toba Inlet bounded by a line drawn from Horace Head on East Redonda Island at the south end of Waddington Channel to the northern point of Roscoe Bay on West Redonda Island and a line drawn within Homfray Channel from Price Pt. on the eastern shore of the channel by a line drawn from George Head at the easterly entrance of Ramsay Arm to Sutil Pt. on Cortes Island.
3) Hotham Sound above a line drawn from Elephant Point on the western shore of the Sound to the southern point of Granville Bay on the eastern shore of the Sound.
4) Jervis Inlet above a line drawn within Prince of Whales Reach from the mouth of Treat Creek on the east shore across the Reach to the summit (1625) at the head of Goliath Bay.
5) Sechelt Inlet including Narrows Inlet and Salmon Inlet above a line drawn within Skookumchuck Narrows from the "dog-leg" point southeast of the Egmont Pt. $224^{\circ}$ across the Narrows to Sechelt Peninsula.

Figure C-1. Strait of Georgia Creel Survey study area and landing site locations used in 1989; hatched areas are not included in the survey area.

APPENDIX D. Species commonly included with other finfish.
Pacific Herring
Pacific Cod
Pacific Tomcod
Walleye Pollock
Pacific Hake
Perches - any perch, seaperch or surfperch
Greenlings
Flounders - Pacific Halibut, any flounder or sole

[^0]:    * In addition, an estimated 1,326 steelhead, cutthroat trout and unidentified salmon were caught by sport fishermen.

[^1]:    * Calculated using data from Table 8 and Appendix B-3.

[^2]:    * Calculated using data from Table 9 and Appendix B-2.

[^3]:    * Overall age composition of estimated catch based on data from Table 13.

[^4]:    * Includes coho, chinook, pink, chum, sockeye, steelhead and cutthroat trout.

[^5]:    * A total closure for lingcod was in effect from January 1 to April 30, and November 15 to December 31, 1989; see Table 3 footnote.
