ABSTRACT

Lewis, D.M. 2004. West Coast Vancouver Island sport fishery creel survey statistics 2001 and historical data 1984-2000. Can. Manuscr. Rep. Fish. Aquat. Sci. 2639: 66 p.

This report documents the 2001 catch and effort estimates for the West Coast Vancouver Island sport fishery creel survey. Catch and effort statistics for the West Coast Vancouver Island tidal sport fishery are presented for each month, Statistical Area and by individual species. Creel survey data collection began in Barkley Sound in 1984 and historical data from fishery officer reports is also presented from 1979-1983. The creel survey expanded over the years to include the entire west coast of Vancouver Island in 2001.

This year's statistics were derived from 5,802 fishing interviews and 145 effort surveys (aerial and onwater counts). Anglers conducted an estimated 76,240 boat trips and kept 52,354 chinook, 38,865 coho, 30 chum, 5,676 pink, 69,912 sockeye, 18,415 halibut, 7,834 lingcod, and 31,968 rockfish. The catch and effort for 2001 increased from the 2000 estimates due to increased fishing opportunities. Effort has increased 15% to 73,462 from 62,710 boat trips in 2000. Chinook catch has increased 20% to 51,146 from 40,942 in 2000. Total salmon catch success has increased from 1.31 in 2000 to 2.19 in 2001. The 2001 WCVI catch consisted of 58,217 groundfish, which made up 26% of the overall catch. The catch success for rockfish declined during the creel survey period from 0.72 fish per boat trip to 0.28 fish per boat trip, while the average catch success for halibut was 0.24 and lingcod was 0.10 fish per boat trip.

Chinook and coho were inspected for adipose fin clips and the presence of a coded wire tag using an electronic sampling device. From fish landed during the creel survey, 2,462 chinook and 2,344 coho were inspected. In 2001, 120 WCVI thermally marked otoliths were found in 718 chinook sampled in WCVI and Northern sport fisheries.

RÉSUMÉ

Lewis, D.M. 2004. West Coast Vancouver Island sport fishery creel survey statistics 2001 and historical data 1984-2000. Can. Manuscr. Rep. Fish. Aquat. Sci. 2639: 66 p.

Ce rapport présente les estimations des captures et de l'effort de 2001 d'après l'enquête sur la pêche sportive sur la côte ouest de l'île de Vancouver (COIV). Nous présentons les statistiques sur les captures et l'effort de la pêche sportive dans les eaux à marée de la COIV par mois, par zone statistique et par espèce. La collecte de données par enquête sur la pêche sportive a commencé dans la baie Barkley en 1984, et nous présentons aussi des données pour 1979-1983 provenant des rapports des agents des pêches. Au fil des ans, l'enquête a pris de l'expansion pour couvrir toute la COIV en 2001.

Les statistiques de 2001 ont été compilées à partir de 5 802 entrevues de pêcheurs et 145 relevés de l'effort de pêche (dénombrements à partir d'aéronefs ou de bateaux). On estime que les pêcheurs ont effectué 76 240 sorties en bateau et ont gardé 52 354 saumons quinnats, 38 865 saumons cohos, 30 saumons kétas, 5 676 saumons roses, 69 912 saumons rouges, 18 415 flétans, 7 834 morues-lingues et 31 968 sébastes. En raison des possibilités de pêche accrues, les captures et l'effort en 2001 étaient en hausse par rapport à 2000. L'effort est passé de 62 710 sorties en bateau en 2000 à 73 462 sorties en 2001 (hausse de 15 %). Les prises de saumons quinnats ont augmenté de 20 %, soit de 40 942 en 2000 à 51 146 en 2001. Le succès de capture pour toutes les espèces de saumons est passé de 1,31 en 2000 à 2,19 en 2001. En 2001, 58 217 poissons de fond ont été capturés, soit 26 % des prises totales. Le succès de capture du sébaste a diminué durant la période de l'enquête, passant de 0,72 à 0,28 poisson par sortie de bateau, tandis le succès de capture moyen était de 0,24 poisson par sortie de bateau pour le flétan et de 0,10 poisson par sortie de bateau pour la morue-lingue.

On a inspecté 2 462 saumons quinnats et 2 344 saumons cohos pour voir s'ils avaient la nageoire adipeuse rognée ou s'ils portaient une micromarque codée (inspection faite à l'aide d'un appareil d'échantillonnage électronique). En 2001, sur 718 saumons quinnats échantillonnés dans les pêches sportives de la côte ouest et du nord de l'île de Vancouver, 120 avaient des otolithes thermomarqués sur la COIV.

1.0 INTRODUCTION

1.1 DESCRIPTION OF THE WCVI SPORT FISHERY

1.1.1 Fishery Area

Prior to 1984, sport catch estimates for the West Coast of Vancouver Island (WCVI) were limited to observations and estimates by Fishery Officers (Appendix C1 & C2). Structured creel surveys have been conducted in Alberni Inlet and Barkley Sound since 1984 covering Statistical Area 23. Since 1991, the WCVI sport fishery has expanded to operate off the west coast of Vancouver Island from Carmannah Point, near Juan de Fuca Strait, to Quatsino Sound on the northwest of Vancouver Island.

This large area is subdivided into 54 creel survey subareas, which vary from the Statistical Areas to more accurately represent sport fishing areas. These include Areas 21, 23-27 and 121-127 (Fig. 1).

The recreational fishery in Area 20-1 centers around the community of Port Renfrew. The area east of Sheringham Point (Area 20-5) is covered by the Georgia Strait creel survey. Several boat ramps and a marina are located in Port San Juan and access is limited by the tides.

The Area 21 fishing area is located immediately outside of Nitinat Lake. Fishing effort in Area 21 originates from boat ramps inside Nitinat Lake, from Port Renfrew and Bamfield.

Area 23 is comprised of two main geographic features, Alberni Inlet and Barkley Sound. Alberni Inlet (Area 23A) is a fjord extending for about 50 km from the mouth of the Somass River with an average width of approximately 1.5 km and depths ranging to almost 400 m. Access to Alberni Inlet is primarily from ramps and marinas at or adjacent to the community of Port Alberni, located at the head of Alberni Inlet.

The southern end of Alberni Inlet opens into Barkley Sound (Area 23B) with numerous groups of islands of various sizes separated by large channels. Access to Barkley Sound is provided from marinas and ramps at Bamfield and Ucluelet as well as from private cabins and commercial fishing lodge operations located along the shoreline and islands of Barkley Sound that are accessible by boat or chartered aircraft.

The Area 24 fishery occurs from Florencia Bay to Hot Springs Cove with the majority of the effort concentrated around Tofino, between Portland Point and Vargas Island. The main launching points are located in Tofino.

The fishing effort in Area 25 in concentrated in Nootka Sound and Tlupana Inlet and to a lesser extent Esperanza Inlet. It is accessed by boat ramps and marinas located in Gold River, Tahsis, Zeballos and Cougar Creek.

Sport fishing in Kyuquot Sound (Area 26) is concentrated in the outer portions of the sound (subarea 26-1) around Spring Island and the offshore area, Kyuquot Reef. The effort in Area 26

is limited in some years due to poor road access and lack of a public gas dock. Currently the bulk of the sport fishing fleet is made up of local lodges and residents.

The creel survey in Area 27 was initiated in 2001. The landing sites designated for the survey were Coal Harbour, Winter Harbour, Port Alice and Holberg. The bulk of the effort was concentrated inside of Cliffe Point in June and moved outside of Cliffe Point in July and August.

Catch and effort data has been collected separately for inshore and offshore areas since 1999 for Pacific Salmon Treaty (PST) catch accounting. Inshore (terminal) areas are defined as those waters inside the surfline and offshore areas are those seaward of that line. Some major offshore fishing areas include Amphitrite Bank, Seven and Twelve Mile Banks, Big Bank, Finger Bank, Portland Point, Bajo Reef and Kyuquot Reef.

The part of the West Coast Vancouver Island chinook sport fishery included in the WCVI Aggregate Abundance Based Management (AABM) chinook fishery includes:

- Areas 21, 23, 24 inside the Canadian "surfline" and Areas 121, 123, 124 during the period October 16 through July 31, plus that portion of Areas 21, 121, 123, 124 outside of a line generally one nautical mile seaward from the shoreline or existing Department of Fisheries and Oceans surfline, during the period August 1 through October 15 (PSC 1999).
- Area 25, 26, 27 inside the Canadian "surfline" and Areas 125, 126, 127 during the period October 16 through June 30, plus that portion of Area 125, 126, 127 outside of a line generally one nautical mile seaward from the shoreline or existing Department of Fisheries and Oceans surfline, for the period July 1 through October 15.

1.1.2 Fishery Period

The West Coast of Vancouver Island is a fertile feeding and rearing area for many salmon stocks. For the main target species, chinook, October through January is predominated by non local feeders which are rearing off the WCVI. In the February through early June period other spring run stocks are migrating through the WCVI fishing area. In the mid June through September period the non local feeders are maturing while local WCVI origins are migrating through the area. The WCVI sport fishing effort is generally focused on these non local feeders migrating through the offshore areas until the local WCVI origin return to terminal areas in July and August.

Sport fishing activity on West Coast Vancouver Island occurs throughout the year but the vast majority of the activity takes place from the beginning of June until the end of September (unpublished Luedke et. al., 1994). The main target species are chinook and coho except for Alberni Inlet in June and July when the target species is the terminal run of Somass sockeye.

The fishery has changed in 2000 and 2001 due to chinook non-retention regulations in terminal areas. The fleet has increased its effort in July, before the inshore closures and moved mainly to offshore areas after the inshore closures. Restrictions in the WCVI sport fishery centre primarily on area and timing closures to protect returning stocks to the WCVI area or those migrating through the area during certain periods.

1.2 OBJECTIVES

The specific objectives of the 2001 WCVI creel survey were:

- 1. To estimate the sport angler effort and catches of chinook by anglers with coefficients of variation less than 10% by month for Statistical Areas 20-1 through 27; and to estimate the number of chinook released. This requires observations of at least 10% of the sport effort.
- 2. To estimate effort, catch and releases for all other species by month and Statistical Area including coho, chum, pink, sockeye, halibut, lingcod, rockfish and other finfish.
- 3. Intensive sampling in Alberni Inlet for Robertson Creek Hatchery chinook.
- 4. To estimate the catch rate for adipose clipped chinook and coho, and determine the presence of coded wire tags in mass marked chinook and coho in the sport fishery.
- 5. To collect biological samples from Somass River sockeye, chinook, coho, halibut and lingcod.

2.0 METHODS

2.1 STUDY DESIGN

The design of the WCVI Creel Survey conducted in 2001 was similar to that used by DPA Consulting Ltd. (1982) with some modifications to the data analysed, sampling intensity, flight routes and data processing. It is comprised of two independent surveys: angler interviews and aerial overflights. Angler interviews provide data on sport fishing catch per unit effort (CPE) and daily activity patterns. Aerial overflights provide estimates of the total sport fishing effort in the study area at the time of the aerial survey. These data are combined to provide monthly estimates of total sport fishing effort and total catch of salmon and groundfish in the sport fishery. In its simplest form, the estimated total catch is calculated by multiplying the estimated total effort by catch per unit effort.

The fishery was stratified according to the following criteria:

- 1. <u>Month.</u> The survey operated from June through to and including September.
- 2. <u>Geographic area</u>. Survey effort was allocated by Statistical Areas 20-1 through 26 and 27 (2001). Offshore areas were separated from inshore areas in the same statistical area.
- 3. <u>Day type</u>. Weekend and mid-week days were considered independently because sport fishing activity is known to differ for the two types of days.
- 4. <u>Time of day.</u> Sampling shifts (one shift is a set number of consecutive hours of interviewing anglers at one site by one creel surveyor) were conducted during set time

periods. From June to September sampling was conducted during either an early shift (approximately 0700 to 1500 hours) or a late day shift (approximately 1500 to 2300 hours).

5. <u>Guided verses unguided anglers</u>. Certain sites are known to have primarily guided fishing effort. Unpublished data from previous surveys in this series confirm that the CPE from guided boats differs markedly from unguided boats. No effort was made to document guided vs. unguided, future creel surveys will try to isolate the two different parties.

In each region, various landing sites were chosen as locations for surveyors to conduct interviews. Site selection was based on 4 criteria: representativeness, traffic volume, site accessibility and adequate observation points. Discussions with local fishers, marina operators and Fisheries Officers and data from previous surveys were used to choose sites that were representative of the local sport fishing activity (i.e. sites which were used by a wide cross-section of anglers). Sites with expected traffic volumes of more than 15 boats per day in the summer were considered as possible sampling locations. Expected traffic volumes for sites were compiled from previous surveys or from discussions with marina operators or local Fisheries Officers. It is not feasible to obtain data from every boat in the fishing area; however a representative sample can be obtained by the optimal allocation of stints at each landing site. This is possible with the estimate of variance from previous creel surveys.

Site accessibility refers to whether an interviewer can easily reach a site by car or ferry during the defined shift hours. Only sites with good accessibility were selected. The final criterion, adequate observation points, was essential for interviewers to obtain an accurate count of all boats returning to a landing site. At some large marinas, where the number of access points made it impossible to see all boats returning, the facility was defined and sampled as two separate sites.

Allocation of sampling effort among months followed the same general pattern as fishing effort, that is, more effort was allocated during the summer when fishing effort is at its highest. Allocation of sampling effort among regions (groups of Statistical Areas) also followed fishing effort patterns. Within each month, each chosen site was allocated shifts. These shifts were divided equally among weekend and mid-week days and as well as being allocated to morning and evening daily time periods.

The Department of Fisheries and Oceans conducted data collection, entry and preliminary processing as well as conducting the estimation of the catch and effort statistics in 2001. Details of the survey design by year, including allocation of sampling effort and analyses, can be found in unpublished reports by DPA Consulting (1984-1987) and summary reports by J.O.Thomas and Associates (1988-1999).

2.2 DATA COLLECTION

2.2.1 Angler Interviews

Surveyors were stationed at boat ramps for scheduled shifts to interview anglers as they returned from fishing. The number of boats returning to a site during a shift as well as the number of interviews attempted and completed were recorded on a tally sheet. For each boating party landing, the following information was recorded on an interview form (Fig. 1):

- 1. Total number of anglers in the boat.
- 2. Time of landing.
- 3. Whether the party had been sport fishing and whether they were guided.
- 4. Residency of anglers.
- 5. Time of departure and length of trip.
- 6. Time during which fishing lines were in the water.
- 7. Average number of lines in the water.
- 8. Catch Summary: -Total number and species of kept and released fish for each of the Statistical Subareas.
 - -Number of hours spent fishing in each Statistical Subarea.
- 9. Number of marked and unmarked chinook and coho in the catch.
- 10. Number of hours directed at each species.
- 11. Loss of salmon to seals.
- 12. Shellfish Catch Summary

Interviewers trained in fish identification inspected each boating party's catch when possible. Landed chinook and coho were checked for a missing adipose fin, and sampled electronically for the presence of a coded wire tag embedded in the fish nose cartilage. In addition, scale samples for age determination and measurements of nose-fork length were taken during every sampling shift.

In 2001, interviews were conducted each month at a maximum of 19 of the 21 designated landing sites (boat ramps, marinas, or resorts, Appendix B-2) representative of the sport fishing activity in the survey area. Targets of desired precision and number of surveyors available dictated the number of sites selected in each area. For each area - day type - work block stratum, sampling shifts at a site were chosen on a near random basis from the total number of shifts available. For definition of the above terms (day type, work block, shift) see Appendix C.

2.2.2 Effort Counts

Aerial surveys, conducted from airplanes travelling along pre-defined routes, allowed observers to count vessels actively sport fishing throughout WCVI. Planes flew at an altitude of 150-210 m (500-700 feet) to facilitate a broad range of vision and still allow easy identification of vessel characteristics. Each plane carried at least one observer; the observer counted sport

fishing boats in the flight path. Observations were periodically audited using a second observer. Figure 2 shows the flight paths used.

The flight path and time of departure were designed to cover major concentrations of sport fishing activity. To maximise precision, flying times during which fishing effort was rapidly changing were avoided. The number of overflights each month was governed by budget constraints targets of desired precision, and by the expected number of interviews from a given number of sampling shifts (English et al. 1986). The days for overflights during a month were randomly selected for each day type.

Alberni Inlet was surveyed using on water effort counts. The counts started at the head of Alberni Inlet. The time in and out of subareas 23A and 23B were recorded as well as the number of sport vessels actively fishing. This was repeated from the mouth of the Alberni Inlet and back to the head. On water effort counts were also used at times and in areas where adequate numbers of aerial surveys were not available due to weather.

2.3 DATA ANALYSIS

يع آن ۽ سا

Data analysis included calculation of catch and effort statistics, calculation of variance of total fishing effort and total catch and estimation of marked chinook and coho salmon. Appendix C of the Strait of Georgia creel report (1999) details the methods and equations used in the above data analysis.

For most survey years, the interviews, landing tallies, and boat counts were entered into data files using the data entry system created by DPA Consulting Ltd. (1985). Catch and effort estimates were produced by a combination of Fortran programs. These programs were translated into Access for the 2000 and 2001 creel surveys. In addition, inseason estimates were produced in an excel spreadsheet. These estimates were used to provide catch estimates for inseason management and to check final estimates for any obvious errors.

In addition to catch estimates generated from creel survey data and aerial overflights, sport lodge catch and effort was also collected. The West Coast of Vancouver Island has a number of remote lodges where catch cannot be captured by the landing site creel survey method. Logbooks are distributed to lodges who voluntarily record their daily catch data by boat or group of boats. Logbooks were distributed in Statistical Areas 20 to 26 (Port Renfrew to Kyuquot). Nine lodges returned completed logbooks out of the 16 possible lodges (56% of the lodges). The data received represented 82% of the total lodge effort (boat trips) and 78% of the lodge chinook catch. The guided boats not covered by logbook information are counted by the effort overflight and included in the creel estimate. In order to add the lodge data to the creel estimate, the daily lodge effort must be subtracted from the aerial overflight data since the overflight observer cannot distinguish guided boats from the rest of the fleet. Once the lodge effort has been removed from the creel effort, lodge catch and effort can be added directly to the creel estimates.

3.1 DISTRIBUTION OF SAMPLING EFFORT

Table 1 shows the number of creel survey interviews conducted with anglers who had been actively fishing by month and Statistical Area in 2001, and the number of monthly effort counts. A total of 5802 interviews, and 145 effort counts were conducted in 2001. Figure 3 shows that the monthly distribution of interviews generally reflected the monthly distribution of fishing effort (number of boat trips, Table 3). The total interviews represent 8.8% of the estimated total fishing effort for the entire study area (65,927 boat trips, Table 3). The interviews ranged in each Statistical Area from a low of 3.0% of the effort in Area 25 to a high of 14.5% of the effort in Area 20-1 (Tables 1 and 4).

3.2 SPORT FISHING EFFORT AND CATCH

The 2001 WCVI sport fishing catch and effort statistics are summarised for each species by month in Table 3 and by Statistical Area in Table 4. Appendices B-1 to B-11 show the fishing effort and catches statistics by species for each combination of month and Statistical Area.

Anglers made 76,240 boat trips during 2001, which is an 18% increase from the 2000 effort of 62,710 trips (Fig. 4, Table 2). Historical years must be compared by area due to the expansion of the WCVI creel survey. The fishing effort followed the same seasonal pattern as seen in previous years with the exception of August when chinook retention was limited to offshore areas (Table 3, Fig. 5). Effort levels climbed steadily from June, peaked in July and declined in September.

The total finfish sport catch in the WCVI was estimated at 225,055 pieces (Table 3) and consisted of 74% salmon and 26% groundfish. Anglers released an additional 19,578 legal sized chinook and 37,564 legal sized coho (Appendix B7 & B8).

There were regulation changes in 2001, which altered the catch and effort of the sport fishery. These included an earlier opening for hatchery marked coho in offshore areas (August 1) than in 2000 (August 24). The chinook conservation corridor in Area 25 included spot closures in terminal areas. There were also unexpected inseason closures for sockeye salmon in Area 23.

General regulations were minimum size limit for chinook of 45 cm, with a daily limit of 2, possession of 4, and an annual limit of 30 for the WCVI. See appendix E for a historical synopsis of regulation changes.

3.2.1 Salmon

Salmon sport catches for the WCVI in 2001 totalled 166,837 pieces (Tables 3 and 4) and consisted of 31% chinook, 23% coho, 4% pink, 42% sockeye salmon.

In 2001, anglers kept 52,354 chinook (Tables 3 and 4), compared to 40,942 in 2000 (Fig. 4, Appendix E-1). The 2001 monthly chinook catches peaked in July and then declined steadily (Fig. 6, Table 3). Seasonal catch efficiency for chinook averaged 0.69 fish per boat trip overall and peaked in June at 0.91 fish per boat trip (Fig. 7, Table 5). In previous years the chinook catches peaked in August when local origin fish returned to terminal areas. These terminal areas were closed to chinook retention in 2000 and 2001 (Appendix E).

The spatial distribution of chinook catch although reduced, followed a similar pattern to previous years. The highest catches were taken in Area 23 (58% of total) (Table 4, Fig. 8). The chinook catch per unit effort was 0.99 for Area 20-1, 1.13 for Area 23, 1.01 for Area 24, 0.54 for Area 25, 1.46 for Area 26, and 0.08 for Area 27.

The 2001 coho catch was 38,865 pieces (Tables 3 and 4). Monthly coho catches peaked in September (Fig. 8 and 9). Coho fisheries were limited to selective mark fisheries in most areas except for terminal areas of Area 23 and 24. Of the coho catch, 54% occurred in Area 23.

In 2001, WCVI anglers caught 30 chum (Fig. 10), highest catches from Area 23B (60%), and 5,676 pink (Fig. 11) of which 46% came from Area 23B and 31% came from Area 20-1. Sockeye catches totalled 69,912 (Fig. 12), highest catches from Area 23A (97%), (Table 4).

The average number of salmon caught during each boat trip in 2001 was 2.19, down from a high of 2.29 in 1996 (Table 5). As seen below, the 2001 value was significantly higher than the range of averages seen in recent years.

Year	Catch Success		
1994	1.09		
1995	1.08		
1996	2.29		
1997	1.73		
1998	1.39		
1999	1.06		
2000	1.31		
2001	2.19		

In 2001, 23B showed the highest effort expended with a total catch per effort of 2.07 (Table 4). Area 23A recorded the greatest number of fish caught per unit effort (5.29). Area 23B recorded the greatest number of salmon hooked and released (Table 4).

The WCVI recreational fishery chinook catch must be accounted in the overall WCVI allowable catch as determined through an Aggregate Abundance Based Management system described in the Pacific Salmon Treaty. The catch is split into inside (terminal) and outside (AABM) catch. In 2001, the inside chinook catch was 6,423 and the outside chinook catch was 52,354. Catch

estimates for other species for these areas, as well as release estimates for chinook and coho can be found in Table 8. Historical inside and outside chinook catch can be found in Appendix G.

3.2.2 Groundfish

The 2001 WCVI catch consisted of 58,217 groundfish, which made up 26% of the overall catch (Tables 3 and 4). Lingcod and rockfish creel estimates have been recorded since 1984, and halibut creel estimates have been recorded since 1993 (Table 2). The species composition of the groundfish catch for 2001, based on the Table 4 data, was as follows:

· .		% of Total	Major
Groundfish	Catch	Groundfish	Catch
Species		Catch	Area
Halibut	18,415	32%	23B
Lingcod	7,834	13%	23B / 25
Rockfish	31,968	55%	23B
Total	58,217	100%	

The majority of the groundfish catch was taken in July when the effort was at its peak (Table 3, Fig. 4). In 2001, rockfish catches peaked dramatically in July compared to previous years when catches were similar over July and August (Figure 14). The same pattern can be seen for WCVI lingcod (Figure 15). Halibut catches in 2001 peaked in July as in previous years and dropped sharply in August (Figure 16).

The catch success for rockfish (Table 3) declined during the creel survey period from 0.72 fish per boat trip in June to 0.28 fish per boat trip in September, while the annual average catch success for halibut was 0.24 and lingcod was 0.10 fish per boat trip (Table 5).

Catch by Statistical Area for rockfish was highest in Area 23B (48% of total, Table 4). Lingcod were caught in greatest numbers in Area 23B and 25 (39% and 41% of total, Table 4), the largest halibut catch came from Area 23B (57% of total, Table 4).

Rockfish were identified by individual species on the interview form. For individual species commonly grouped as rockfish see appendix F. Of the rockfish identified by species in 2001, 40% were shown to be Black Rockfish (Sebastes melanops), 15% Yelloweye (Sebastes ruberrimus), 14% Canary (Sebastes pinniger), 14% Quillback (Sebastes maliger), 7% Copper (Sebastes caurinus), 6% China (Sebastes nebulosus), and 4% other (Table 10, Figure 17). These proportions are derived from creel survey estimates only because some of the lodge rockfish catch data provided was not broken down by species.

Historically, halibut, lingcod and rockfish annual catches vary based on areas surveyed and access to salmon (Figure 18).

3.3 BIOLOGICAL DATA

2.3.1 Chinook and Coho

In 2001, 2,462 chinook were inspected for adipose fin clip marks and the presence of a coded wire tag. Of the number inspected, 3% were adipose-clipped chinook with coded wire tags and 4% were adipose-clipped chinook with no coded wire tag. No electronic response to the adipose fin clipped fish could be due to wand error or no coded wire tag (note: the 1998 brood year mass marked chinook which were adipose clipped but not tagged). Total number of chinook inspected in the creel survey by month and area is shown in Table 6. The submission rate is-a measure of the difference between the creel survey observed mark incidence and the submitted mark incidence. It is also referred to as the awareness factor. During the creel survey period there were 251 marks submitted from the creel survey and voluntary head depots in Areas 23 to 27. The submission rate of marks from Barkley Sound was 0.12 for 2001 (Appendix H); this rate ranges from 0.08 to 0.51 from 1992 to 1999. Of the marks submitted 15 were WCVI origin, 18 were from other Georgia Strait and Fraser River, and 218 of U.S. origin (Appendix I).

Among the 2,344 coho examined for marks, 53% were adipose fin clipped and 5% had coded wire tags (Table 7). The largest observed proportion of adipose fin clips was found in Area 23B. These numbers do not include adipose clipped fish retained by the lodges. Submission rates for coho marks were not calculated for 2001 due to the abundance of mass marked coho. In 2001, 530 fin clipped coho heads were submitted, of these 74 tags were recovered and 456 had no tag. Included in the tags recovered were 52 WCVI origin, 13 Georgia Strait and Fraser River, and 9 of U.S. origin (Appendix J).

2.3.2 Otolith Thermal Marks

Thermal marking is a means of marking hatchery fish. With thermal marking, 100% of the hatchery fish are marked. By altering the appearance of the otolith increments through short-term temperature manipulations to create a predetermined pattern used for determining hatchery contribution to catch and escapement (and thereby, exploitation rate).

Due to low incidence of coded wire tags from the indicator stock (Robertson Creek Hatchery/ RCH) otoliths were used to estimate exploitation rate. A sampling program was implemented in 2000 and 2001 to obtain otoliths from chinook that were caught during August and September by recreational fishermen along the WCVI (Hargreaves et al, 2001). Terminal management actions were evaluated using otoliths.

In 2001, management actions taken to prevent the retention of Somass chinook stocks were successful in that only 26 RCH thermal marks were recovered in 718 samples (3.6%) taken from the Northern and WCVI Sport fisheries (Table 9).

In 2000, 7 Robertson Creek Hatchery thermal marks were recovered from 947 otolith samples taken (0.7%) in Northern and WCVI sport fisheries (Table 9).

4.0 SUMMARY

100

A sport fishery creel survey was conducted in the WCVI in 2001 in order to estimate the catches of all the important recreational finfish species and the total sport fishing effort (boat trips). In this report, data are presented by both month and Statistical Areas. Comparisons are made to previous data to determine trends in catch and effort. From the catch and effort estimates catch successes could be calculated. This data also provide estimate numbers of chinook and coho salmon with adipose fin clips.

The increase in coho catch from 7,070 in 2000 to 38,865 in 2001 was related to increased abundance and fishing opportunities in 2001, than in the previous 3 years for coho. Chinook catches also increased with the increase in effort from 2000. Effort has increased 15% to 73,462 from 62,710 boat trips in 2000. Chinook catch has increased 20% to 51,146 from 40,942 in 2000. Total salmon catch success has increased from 1.31 in 2000 to 2.19 in 2001.

In 2001, sport fishers made an estimated 76,240 boat trips in the WCVI. A total of 5,802 actively fishing boat parties, were interviewed at a monthly maximum of 19 landing sites in the WCVI creel survey area. This sampling represents approximately 8.8% of the total number of boat trips conducted by sport fishers in the WCVI in 2001. A total of 145 effort counts were also conducted to take "snapshot" counts of fishing effort.

In 2001, sport fishers in the WCVI landed an estimated total finfish catch of 235,367 pieces of which 75% were salmon and 25% were groundfish. The 166,837 landed salmon consisted of 52,354 chinook, 38,865 coho, 30 chum, 5,676 pink salmon and 69,912 sockeye salmon. Anglers released an additional 57,142 legal sized chinook and coho. Catch success per boat trip averaged 2.18 for salmon (all species) and 0.76 for groundfish. The 58,169 landed groundfish consisted of 18,415 halibut, 7,834 lingcod, and 31,920 rockfish.

Among salmon examined for marks, 7.0% of chinook and 0.53% of coho had adipose fin clips. Of the fin clipped heads submitted, 251 chinook coded wire tags and 74 coho coded wire tags were recovered.

5.0 ACKNOWLEDGMENTS

I would like to thank the creel surveyors (Shaunee Lauder, Joanne Verhaeghe, Hank & Thelma Buitendyk, Peggy Fletcher, Jan Carter, Justin Erikson, Luke Osenenko, Anthony Sutton, Helen Dunn and the Pacheedaht First Nation) for their flexibility to the changing demands of the creel survey; private marina, boat ramp and lodge owners for their valuable assistance and cooperation. Thanks also to the many thousands of anglers who participated voluntarily in the survey.

HISTORICAL CATCH AND EFFORT GRAPH OF CHINOOK AND COHO FOR AREA 23, 1979 TO

CHINOOK CONSERVATION CORRIDOR, NWVI, 2001. APPENDIX D1.

CHINOOK CONSERVATION CORRIDOR, SWVI, 2001 APPENDIX D2.

APPENDIX E. SPORT FISHERY.

HISTORICAL REGULATION CHANGES AFFECTING THE WCVI

1984	Robertson Creek hatchery chinook was designated as an indicator stock used to evaluate
	the status of west coast Vancouver Island chinook stocks (Pacific Salmon Treaty
	chinook rebuilding program subsequent to 1985). Only Statistical Area 23 surveyed.
1992	Survey expanded to include Statistical Area 24.
1994	Daily chinook limit is reduced to 2 chinook/day.
	Daily coho possession limit reduced to zero.
1996	Daily possession limit of chinook reduced from 2/day to zero on August 1.
1997	Chinook non-retention after July 25 (NWVI) and August 1 (SWVI). Some areas allowed
	chinook retention of 2 / day under 50cm (20-1,2,3,4;-21, 23 to 27; 121,123 to 127).
1998	Coastwide barbless hook restriction for salmon fishing. Some total finfish closures due
	to Thompson River coho concerns. Terminal areas open for salmon fishing but non-
_ =	retention for coho.
1999	Coastwide barbless hook restriction. In 1999, special management zones were
	introduced to most of West Coast Vancouver Island. Coho retention was limited to
	terminal areas of Area 23 and 24 (yellow zones) until Sept. 10 when it was expanded to
	include more outside areas (grey zones).
	New in 1999 was a requirement to determine catch in the offshore area (more than 1
	mile offshore) versus the near shore area. Under the new PST agreement, a portion of
	the WCVI recreational fishery chinook catch must be accounted in the overall WCVI
	allowable catch as determined through an Abundance Based Management system.
2000	Chinook non-retention was implemented in Areas 23 and 24 as of August 1 and in Areas
	26 and significant portions of 25 as of July 15. In areas open for retention of chinook
	the daily limit was set at two of which only one could be over 77 cm in length (slot
	limit). These measures were in effect until October 15.
	The most significant management measure in 2000 was implementation of a
	conservation (no salmon-fishing) corridor, generally extending one to two miles beyond
	the surf line. This corridor was implemented from July 15 to September 30 in Area 125
	and from August 1 to September 30 in Areas 121 to 124. The daily limit for chinook in
	open areas was set at two per day of which only one could be over 77 cm in length from
	July 15 to September 30.
	Selective mark fisheries for coho in terminal areas of 23 and 24 starting July 1.
	Offshore retention of hatchery coho after August 24.
2001	Chinook non-retention was implemented in Areas 23 and 24 as of August 1 and in Areas
	26 and significant portions of 25 as of July 15. Chinook conservation corridor still in
	effect with changes to Area 25 corridor location. In areas open for retention of chinook,
	slot limit still in effect.
	Caba calcative most fighery around continue offshare (Assessed 1) Techano calcative week
	Coho selective mark fishery opened earlier offshore (August 1). Inshore selective mark
	fishery opened June 8.
