\*Urban centres with a population of 10,000 + are included in the survey. Detailed reports are available for CMAs.

### Vacancy rate rises in Quebec

- The average vacancy rate in privately initiated structures with three or more housing units in Quebec's urban centres (with 10,000 or more inhabitants) reached 3.7 per cent in October.
- Between October 2013 and October 2014, the vacancy rate in Quebec rose by 0.6 of a percentage point, which was a statistically significant increase.
- Among the Quebec's six census metropolitan areas (CMAs), only Sherbrooke and Trois-Rivières did not post significant changes in their vacancy rates.
- Once again this year, market conditions tended to be tighter in the case of larger apartments.
- The average rent for two-bedroom apartments reached \$711, with the CMA averages varying between \$568 and \$775.

## Vacancy rate increases for Quebec overall

According to the results of the Rental Market Survey conducted in October by Canada Mortgage and Housing Corporation (CMHC), the average vacancy rate in privately initiated structures with three or more housing units in Quebec's urban centres (with 10,000 or more inhabitants) rose by 0.6 of a percentage point between October 2013 and October 2014, reaching 3.7 per cent.

Among the province's 44 urban centres, 45 per cent posted increases in their vacancy rates between the last two fall surveys. The vacancy rates did not show any significant changes in a third of the urban centres, while, in 20 per cent of them, the rates registered decreases.

Most of Quebec's CMAs posted significant changes in their vacancy rates between the last two October surveys. Only the Sherbrooke and Trois-Rivières CMAs showed stable results from a statistical standpoint. For the other urban agglomerations, the October survey results revealed a higher vacancy rate for all centres with 10,000 to 49,999 inhabitants and a stable overall rate for agglomerations with 50,000 to 99,999 inhabitants.

## New rental housing construction and falling demand cause market conditions to ease

As usual, the changes and conditions on rental market reflect the interaction between supply and demand on that market. Factors that are favourable to demand,

such as increases in migration and employment, put downward pressure on the vacancy rate, while the addition of new rental housing units pushes this rate upward.

In all of Quebec's urban centres, demand for rental housing showed signs of slowing down. The movement to homeownership likely remained stable, and net migration decreased over the 12 months preceding the survey (period from October 2013 to September 2014). In addition, employment among young people aged from 15 to 24 was on a slight downward course over the same period, which contributed to limiting demand for rental housing. The decline in employment among young people was due in part to the fact that many of them occupy entry-level positions, which are more sensitive to general trends in the job market.

Rental housing starts, however, registered a hike of 35 per cent from October 2013 to September 2014 over the corresponding period a year earlier (from October 2012 to September 2013). After having been concentrated in condominium segment in recent years, construction picked up the pace in the rental housing segment over the course of the year.

It was therefore a less significant demand, combined with a greater supply of dwellings offered for rent, that led to the increase in the vacancy rate observed in the province of Quebec.

The changes in supply and demand varied depending on the areas, as population movements, economic conditions and rental housing construction affected the results for each centre.

## Market segments

In Quebec, the survey results revealed that the vacancy rates were lower for larger apartments. In fact, for all urban centres (with 10,000 or more inhabitants), the vacancy rates went from 4.6 per cent in the case of bachelor units and decreased progressively as the number of bedrooms increased, reaching 3.1 per cent for apartments with three or more bedrooms. Given the level of statistical reliability of the data, we cannot confirm or refute this result at the regional level.

In general, apartments with more bedrooms are appealing thanks to their size (as an extra bedroom can be used to set up a home office or house a roommate), which also makes them substitutes for other types of dwellings particularly intended for first-time homebuyers (semi-detached homes, row houses and condominiums).

It is interesting to note that, even though the rent differences between two-bedroom apartments and smaller units are similar across all urban centres, smaller units enjoy greater popularity in larger centres than in smaller ones. For the CMAs, the vacancy rate for bachelor apartments was 4.3 per cent in October 2014, compared to 8.2 per cent in the case of centres with 10,000 to 99,999 inhabitants. Given that CMAs are employment hubs for young people, in addition to offering many educational institutions and an urban lifestyle, demand for bachelor units is greater there than in smaller urban centres.

## Rents

For all urban centres in the province, the average rent for two-bedroom apartments stood at \$711 this past October. Overall, the size of agglomerations has a direct impact on rents. More specifically, the size of an urban centre influences the economic base, which, in turn, affects jobs and incomes and, consequently, the financial capacity of households and their housing choices. As a result, the average rents for two-bedroom apartments reached \$569 for census agglomerations (CAs) with 10,000 to 49,999 inhabitants, \$597 in the case of CAs with 50,000 to 99,999 inhabitants and \$729 for the CMAs. Among the CMAs, the lowest average rent was recorded in Trois-Rivières (\$568), while the highest was registered in the Québec area (\$775).

Between October 2013 and October 2014, the estimated change in the average rent for the province was 2.0 per cent. For the corresponding period a year earlier, the increase had reached 1.6 per cent. Given their relative weight in the universe of rental housing units in Quebec overall, the CMAs showed a similar increase in rents this year (+2.1 per cent). However, Gatineau, Sherbrooke and Trois-Rivières, which had the highest vacancy rates among the CMAs, posted smaller increases in their average rents, with rises varying between 1.3 per cent and 1.5 per cent.

In analyzing the rents, especially by urban centre or by unit type, it is important not to interpret changes in rents too directly in relation to vacancy rates. In some cases, the

results may seem counterintuitive, as the composition of the universe, which may be affected by such factors as renovated units, is not directly measured as part of CMHC's Rental Market Survey.

At the time of the last survey, the estimated increases in the average rents by apartment type were comparable to the total increase for all units.

## Rental condominiums

Over the years, the rental condominium phenomenon has been growing across Canada's major metropolitan areas, and Quebec's large centres were no exception.

In the Montréal CMA, the proportion of condominiums offered for rent has progressively increased since 2011, rising from 9.3 per cent in 2011 to 13.3 per cent in 2014.

Over the past year, many condominium projects were completed in Montréal, increasing the supply of units that could potentially be rented on the market. Once again, the vacancy rate for rental condominiums (3.4 per cent) was close to the rate for the conventional rental market.<sup>1</sup> Since 2011, the vacancy rate difference between conventional rental apartments and rental condominiums has not exceeded 0.3 of a percentage point.

In the Québec CMA, the proportion of condominiums offered for rent also rose, reaching 10.2 per cent in October 2014, compared to 6.3 per cent in 2011. After having recorded a jump to 5.9 per cent

in 2013, the rental condominium vacancy rate fell to 3.2 per cent and has now moved closer to the conventional rental housing vacancy rate (3.1 per cent). Even though supply increased in the Québec CMA, demand was significant, which caused the rental condominium vacancy rate to decrease. Rental condominiums often come with particular amenities (swimming pools, common areas, etc.) that seem to appeal to the tastes of some renters.

As for the average rents, the gaps between the secondary and conventional rental markets are significant. In the Montréal CMA, the average rent for two-bedroom rental condominiums was \$1,144, or 54.8 per cent more than the average for purpose-built rental units of the same type. In the Québec CMA, the gap was 38.1 per cent, and the average rent for rental condominiums reached \$1,070. When considering only the 20 per cent of conventional rental housing units with the highest rents, the gaps are then 34.6 per cent in Montréal and 22.3 per cent in Québec.

The rent difference between the rental condominium and conventional rental markets is partly due to the fact that the condominium stock is generally newer and higher end and offers a more complete range of specific amenities than conventional rental housing.

## Around the province

The vacancy rate on the rental market in the Montréal CMA rose over the past year, reaching

<sup>1</sup> The conventional rental market excludes the seniors' housing segment.

3.4 per cent in October 2014, compared to 2.8 per cent in October 2013. The increase in the vacancy rate was essentially due to a lower rental housing demand combined with a relatively stable supply. It should be noted that competition from rental condominiums, the decrease in net international migration and the continued large interprovincial and interregional migration deficits contributed to the easing of the conventional rental market. The average rent for two-bedroom apartments reached \$739, and the estimated change in the average rent for apartments of this type between October 2013 and October 2014 was 2.2 per cent.

The rental housing vacancy rate increased in the Québec CMA, reaching 3.1 per cent in October 2014, compared to 2.3 per cent a year earlier. The easing of the market was due to an increase in supply that outpaced the rise in demand. On the supply side, more rental housing units were completed in 2014 than in 2013. As well, the probable impact of the increase in rental condominiums—substitutes for high-end conventional rental apartments—should also be considered. On the demand side, it is estimated that the growth slowed down. One of the reasons for this slowdown was the decline in employment among young people aged from 15 to 24. Between October 2013 and October 2014, the estimated change in the average rent for two-bedroom apartments was 2.0 per cent. The average rent for such units reached \$775 this past October.

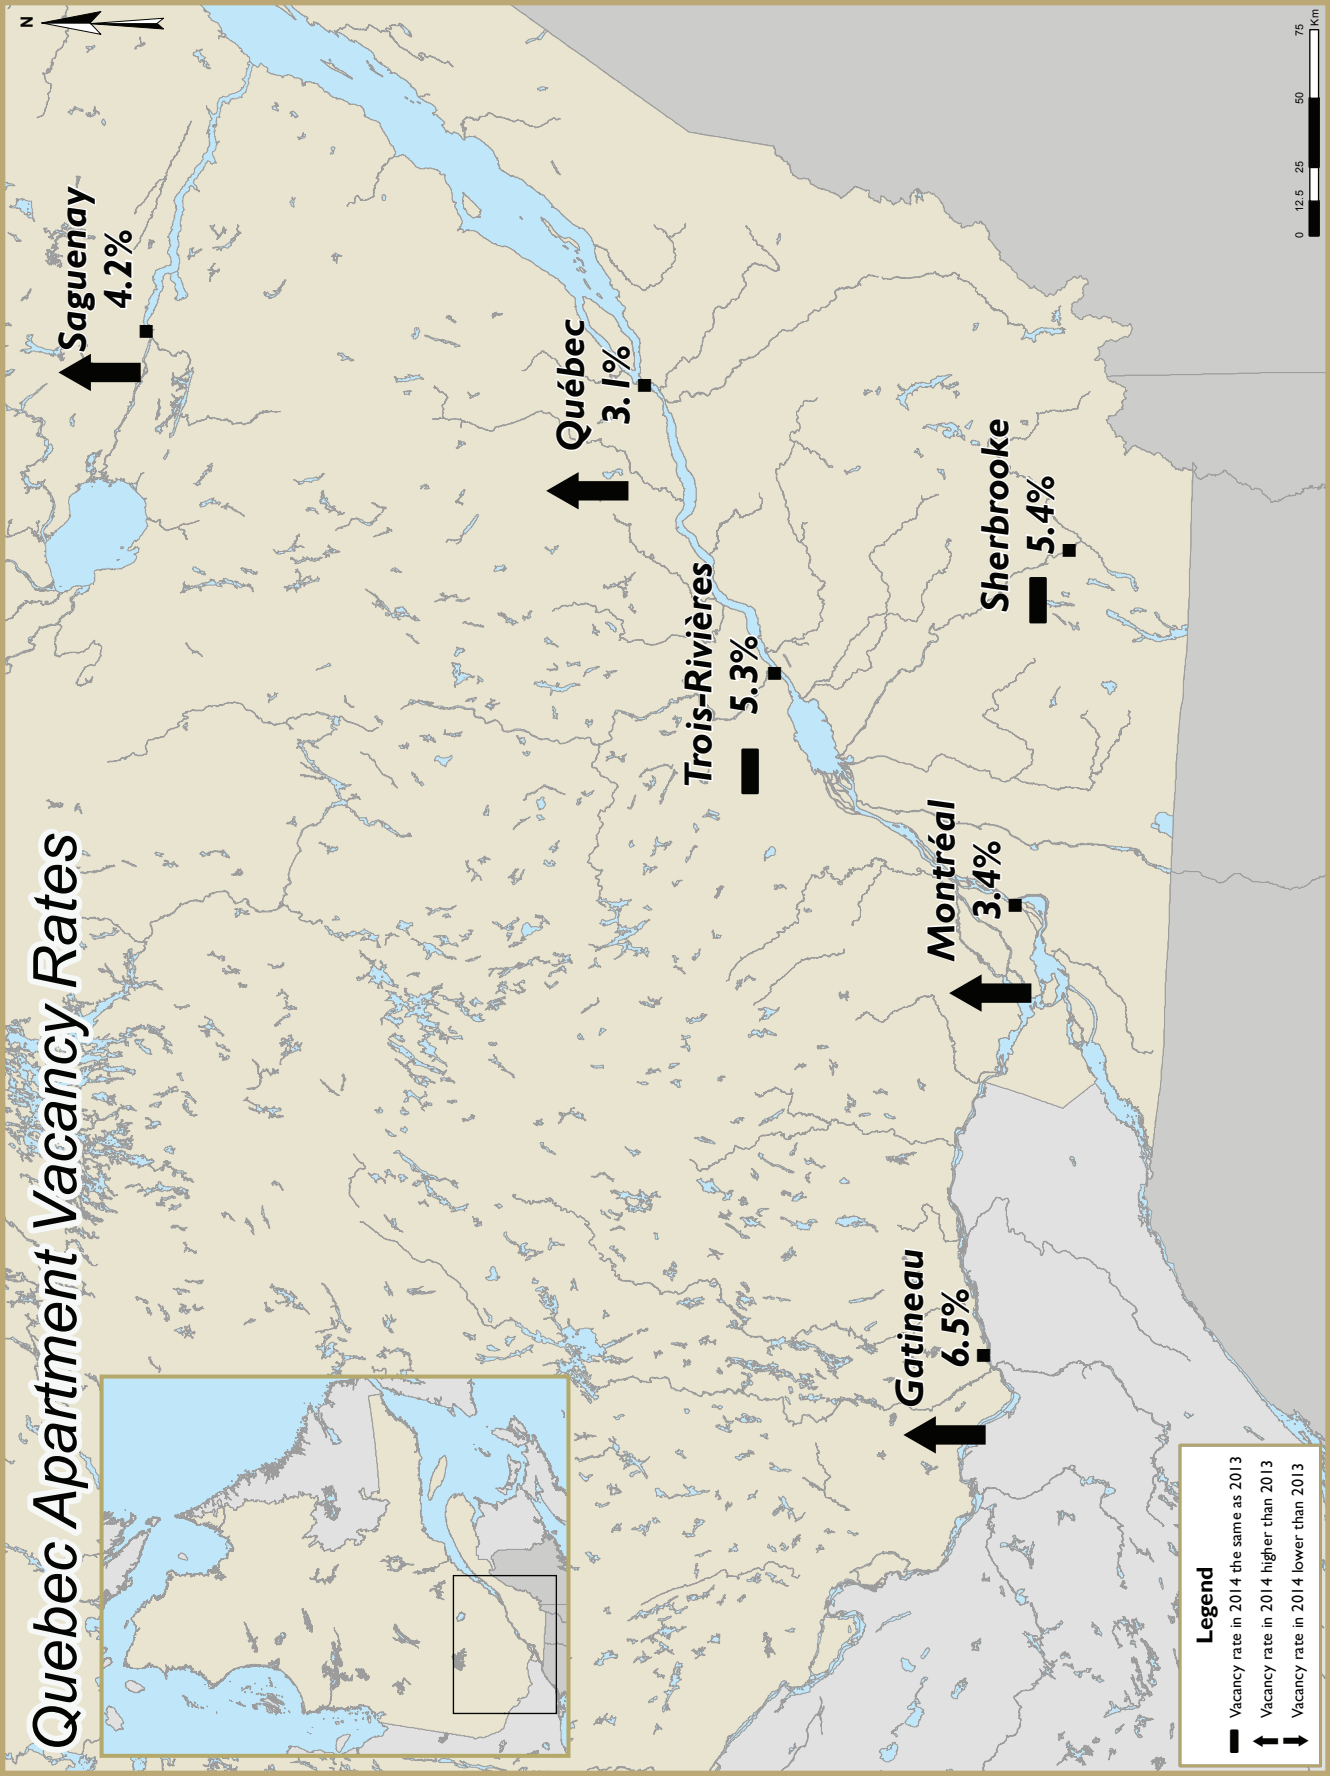

In the Quebec part of the Ottawa-Gatineau CMA, rental market conditions eased for a third straight year. The vacancy rate climbed to 6.5 per cent in October of this year, compared to 5.1 per cent in October 2013. As a result, the Gatineau rental market had one of the highest vacancy rates among all the CMAs in the province. The increase in the proportion of vacant rental units between the last two fall surveys was attributable to a weaker demand and a relatively stable supply over the same period. The average rent for two-bedroom apartments in the Gatineau area was \$750 this past October. Given the higher vacancy rate this year, the estimated change in the average rent for all apartment types combined between October 2013 and October 2014 was only 1.3 per cent in the Gatineau area.

The rental apartment vacancy rate in the Sherbrooke CMA remained stable for the second straight year, reaching 5.4 per cent in October 2014. The easing trend that had characterized the market for several years gave way to stable conditions. Since 2012, the slower movement to homeownership and positive net migration, which stimulated the growth in households, have particularly contributed to supporting rental housing demand. In 2014, these factors led the vacancy rate to stabilize at the level mentioned above, while the supply of new apartments increased at a steady pace. As a result of the relatively high vacancy rate observed since 2012, the average rents did not post any significant increases. The estimated change in the average rent between October

2013 and October 2014 was limited (+1.3 per cent), and the average rent for two-bedroom apartments reached \$604 this past October.

For the second time in as many years, market conditions remained stable in the Trois-Rivières CMA (as the proportion of unoccupied units reached 5.3 per cent this past October). Market conditions remained unchanged this year, as a result of the fact that demand and supply followed similar trends. With the job market picking up somewhat, demand rose moderately. The increase in demand was, however, offset by the additional supply of rental housing units. As a result, the change in rents held relatively steady. For the period from October 2013 to October 2014, the growth in rents was 1.8 per cent (for two-bedroom units). The average rent for two-bedroom apartments, which reached \$568, was the lowest among the CMAs across the country.

In the Saguenay CMA, the vacancy rate reached 4.2 per cent this past October, compared to 2.8 per cent a year earlier. This easing of the market resulted from a moderate increase in supply combined with a less significant demand in the area. In fact, employment decreased among young people aged from 15 to 24, which contributed to limiting the growth in demand. However, the decrease in rental housing demand was lessened by the slower movement to homeownership. Between 2013 and 2014, the estimated increase in the average rent for two-bedroom apartments was 2.1 per cent, and the average rent for such units has now reached \$595.

<sup>1</sup>The Percentage Change of Average Rent is a measure of the market movement, and is based on those structures that were common to the survey sample for both years.

The following letter codes are used to indicate the reliability of the estimates:

a - Excellent, b- Very good, c - Good, d - Fair (Use with Caution)

\*\* Data suppressed to protect confidentiality or data not statistically reliable.

++ Change in rent is not statistically significant. This means that the change in rent is not statistically different than zero (0).

n/u: No units exist in the universe for this category n/s: No units exist in the sample for this category n/a: Not applicable

## TECHNICAL NOTE:

*Difference between Percentage Change of Average Rents (Existing and New Structures) AND Percentage Change of Average Rents from Fixed Sample (Existing Structures Only):*

Percentage Change of Average Rents (New and Existing Structures): The increase/decrease obtained from the calculation of percentage change of average rents between two years (example: \$500 in the previous year vs. \$550 in current survey represents an increase of 10 percent) is impacted by changes in the composition of the rental universe (e.g. the inclusion of newly built luxury rental buildings in the survey, rental units renovated/upgraded or changing tenants could put upward pressure on average rents in comparison to the previous year) as well as by the rent level movement (e.g. increase/decrease in the level of rents that landlords charge their tenants).

Percentage Change of Average Rents from Fixed Sample (Existing Structures Only): This is a measure that estimates the rent level movement. The estimate is based on structures that were common to the survey sample for both the previous year and the current Rental Market Surveys. However, some composition effects still remain e.g. rental units renovated/upgraded or changing tenants because the survey does not collect data to such level of details.

## METHODOLOGY FOR RENTAL MARKET SURVEY

Canada Mortgage and Housing Corporation (CMHC) conducts the **Rental Market Survey (RMS)** every year in April and October to estimate the relative strengths in the rental market. The survey is conducted on a sample basis in all urban areas with populations of 10,000 and more. The survey targets only privately initiated structures with at least three rental units, which have been on the market for at least three months. The survey collects market rent, available and vacant unit data for all sampled structures.

The survey is conducted by a combination of telephone interviews and site visits, and information is obtained from the owner, manager, or building superintendent. The survey is conducted during the first two weeks of April/October, and the results reflect market conditions at that time.

CMHC is constantly reviewing the Universe of rental structures in the rental market Universe to ensure that it is as complete as possible. Every year, any newly completed rental structures with at least 3 rental units are added to the Universe. In addition to this, CMHC undertakes comprehensive reviews by comparing the Universe listing to other sources of data to ensure that the list of structures is as complete as possible.

CMHC's Rental Market Survey provides a snapshot of vacancy and availability rates, and average rents in both new and existing structures. There also exists a measure for the change in rent that is calculated based on existing structures only. The estimate is based on structures that were common to the survey sample for both the previous year and the current Rental Market Surveys. The change in rent in existing structures is an estimate of the change in rent that the landlords charge and removes compositional effects on the rent level movement due to new buildings, conversions, and survey sample rotation. The estimate of per cent change in rent is available in all Canada and Provincial Highlights publications, and also in the CMA reports (fall survey only). The rent levels in new and existing structures are also published. While the per cent change in rents in existing structures published in the reports are statistically significant, changes in rents that one might calculate based on rent levels in new and existing structures may or may not be statistically significant.

Use caution when comparing changes in statistics from one year to the next. Even if there is a year over year change, it is not necessarily a statistically significant change. These tables include indicators to help interpret changes. ↑ indicates the year-over-year change is a statistically significant increase, ↓ indicates the year-over-year change is a statistically significant decrease, while – indicates that the effective sample does not allow one to interpret any year-over-year change as being statistically significant.

## METHODOLOGY FOR SECONDARY RENTAL MARKET SURVEY

Canada Mortgage and Housing Corporation (CMHC) conducts a survey of the **Secondary Rental Market (SRMS)** in September and October to estimate the relative strengths in the secondary rental market which is defined as those dwellings not covered by the regular RMS – rented single-detached homes, semi-detached (double) homes, rented freehold row/townhomes, rented duplex apartments (i.e., one-above-other), rented accessory apartments (separate dwelling units that are located within the structure of another dwelling type), rented condominiums (can be any dwelling type but are primarily apartments), and one or two apartments which are part of a commercial or other type of structure.

The SRMS has three components which are conducted in selected CMAs:

- A Household Rent Survey of all households to collect information about rents.
- A Condominium Apartment Rent Survey of households living in condominium apartments to collect information about rents.
- A Condominium Apartment Vacancy Survey of condominium apartment owners to collect vacancy information.

All three surveys are conducted by telephone interviews. For the condominium apartment vacancy survey, information is obtained from the owner, manager, or building superintendent and can be supplemented by site visits if no telephone contact is made. For the other two surveys, information is collected from an adult living in the household. All surveys are conducted in September and October, and the results reflect market conditions at that time.

CMHC publishes the number of units rented and vacancy rates for the condominium vacancy survey. For the condominium rent and household rent surveys, the average rent is published. A letter code representing the statistical reliability (i.e., the coefficient of variation (CV)) for each estimate is provided to indicate the data reliability. Rented condominium apartments were surveyed in the following CMAs: Vancouver, Victoria, Calgary, Edmonton, Regina, Saskatoon, Winnipeg, Toronto, Ottawa, Montréal and Québec (NOTE: Condo rent data was not collected for Regina and Saskatoon). Other secondary rental market units were surveyed in Abbotsford, Barrie, Calgary, Edmonton, Halifax, Montreal, Ottawa, Quebec, St. John's, Toronto, Winnipeg, Regina, Saskatoon, Kelowna, Vancouver and Victoria.

Every year CMHC reviews the method of estimation for Household Rent Survey, which may result in some changes to previously published estimates. All statistics in this report are reflective of the new method of estimation.

## DEFINITIONS

**Availability:** A rental unit is considered available if the existing tenant has given, or has received, notice to move, and a new tenant has not signed a lease; or the unit is vacant (see definition of vacancy below).

**Rent:** The rent refers to the actual amount tenants pay for their unit. No adjustments are made for the inclusion or exclusion of amenities and services such as heat, hydro, parking, and hot water. For available and vacant units, the rent is the amount the owner is asking for the unit.

It should be noted that the average rents reported in this publication provide a sound indication of the amounts paid by unit size and geographical sector. Utilities such as heating, electricity and hot water may or may not be included in the rent.

**Rental Apartment Structure:** Any building containing three or more rental units, of which at least one unit is not ground oriented. Owner-occupied units are not included in the rental building unit count.

**Rental Row (Townhouse) Structure:** Any building containing three or more rental units, all of which are ground oriented with vertical divisions. Owner-occupied units are not included in the rental building unit count. These row units in some centres are commonly referred to as townhouses.

**Vacancy:** A unit is considered vacant if, at the time of the survey, it is physically unoccupied and available for immediate rental.

### Definitions of Census Areas referred to in this publication are as follows:

A census metropolitan area (CMA) or a census agglomeration (CA) is formed by one or more adjacent municipalities centred on a large urban area (known as the urban core). The census population count of the urban core is at least 10,000 to form a census agglomeration and at least 100,000 to form a census metropolitan area. To be included in the CMA or CA, other adjacent municipalities must have a high degree of integration with the central urban area, as measured by commuting flows derived from census place of work data. CMAs and CAs contain whole municipalities or Census Subdivisions.

Data presented is based on Statistics Canada's 2011 Census area definitions.

### Acknowledgement

The Rental Market Survey and the Secondary Rental Market Survey could not have been conducted without the cooperation of the rental property owners, managers, building superintendents and household members throughout Canada. CMHC acknowledges their hard work and assistance in providing timely and accurate information. As a result of their contribution, CMHC is able to provide information that benefits the entire housing industry.

## CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for more than 65 years.

Together with other housing stakeholders, we help ensure that the Canadian housing system remains one of the best in the world. We are committed to helping Canadians access a wide choice of quality, environmentally sustainable and affordable housing solutions that will continue to create vibrant and healthy communities and cities across the country.
