Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published
- * significantly different from reference category ($p < 0.05$)

Notice to readers

Estimates released in this publication are based on the 2011 Census counts adjusted for census net undercoverage and incompletely enumerated Indian reserves to which is added the estimated demographic growth for the period going from May 10, 2011 to the date of the estimate.

These estimates are not to be mistaken with the 2011 Census counts.

The analysis in this publication is based on preliminary data. These data will be revised over the coming years, and it is possible that some trends described in this publication will change as a result of these revisions. Therefore, this publication should be interpreted with caution.

Most of the components, used to produce preliminary population estimates, are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

Acknowledgements

The analysis of this publication was prepared by André Lebel and Patrick Charbonneau with the collaboration of Hélène Landry, all of the Population estimates section of the Demography division of Statistics Canada. The authors would also like to thank for their valuable comments: Yvan Clermont and Hubert Denis.

Highlights

- On July 1, 2014, Canada's population was estimated at 35,540,400, up 386,100 or 1.1% from July 1, 2013.
- This increase was slightly lower than the one observed over the previous year (+1.2% in 2012/2013), but similar to the average annual population increase of the last 30 years (+1.1%).
- Since 1993/1994, net international migration has been the main source of population growth for Canada. In 2013/2014, net international migration was responsible for two-thirds of the country's population growth.
- Over the last year, population growth was negative in Newfoundland and Labrador (-0.2%) and New Brunswick (-0.2%).
- Growth was above the national level (+1.1%) in Nunavut (+3.2%), Alberta (+2.8%), Saskatchewan (+1.7%) and Manitoba (+1.3%).
- On July 1, 2014, 15.7% of Canada's population was aged 65 and older. Thirty years earlier, this proportion was 10.0%.
- The highest proportions of seniors aged 65 and over among the population were in New Brunswick and Nova Scotia (18.3% in both cases) and the lowest in Nunavut (3.7%).
- On July 1, 2014, people under the age of 15 accounted for 16.1% of Canada's total population.
- Population estimates show, for the first time, that there are more persons aged 55 to 64, the age when people typically leave the labour force, than those aged 15 to 24, the age when people typically enter the labour force.

Section 1

Total population

This section presents mainly preliminary population estimates for Canada, provinces and territories on July 1, 2014, along with a detailed analysis of components of population growth.

1. Rates are based on the average population over the period.

1.1 National portrait

1.1.1 Canadian's population reached 35.5 million

On July 1, 2014, Canada's population was estimated at 35,540,400, up 386,100 or 1.1%¹ over the last year (2013/2014). This increase was slightly lower than the one observed in the previous year (+1.2% in 2012/2013) and similar to the average population increase for the last 30 years (+1.1%). Except for the period between 1986/1987 and 1989/1990, the overall population growth rate has shown little variation in 30 years, ranging between 0.8% and 1.2%.

Chart 1.1
Population growth rate, 1983/1984 to 2013/2014, Canada

1.1.2 Canada records the strongest population growth among G7 countries

Canada's population growth rate (+1.1%) was the highest among the G7² countries for a comparable period, including the United States (+0.7%), the United Kingdom (+0.6%), France (+0.4%), Germany (+0.3%), Italy (+0.1%) and Japan (-0.2%). Among

industrialized countries, Canada's current population growth fell below the estimated rates for countries such as Australia (+1.7%), New Zealand (+1.5%) and Switzerland (1.2%).

2. The G7 is an informal discussion group and economic partnership consisting of seven major advanced economies: the United States, Japan, Germany, France, United Kingdom, Italy and Canada. Sources: Eurostat and US Census Bureau for similar periods.

Chart 1.2

Population growth rate, most recent annual period available¹, G7 countries

1. For Canada, the most recent annual period available extends from July 1, 2013 to June 30, 2014. For France, Germany, Italy and United Kingdom, the most recent annual period available extends from January 1, 2013 to December 31, 2013. For United States, the most recent annual period available extends from July 1, 2012 to June 30, 2013. For Japan, the most recent annual period available extends from October 1, 2012 to September 30, 2013.

Sources: Statistics Canada, Eurostat, U.S. Census Bureau, Statistics Bureau of Japan.

1.1.3 Population growth was mainly driven by international migration

International migration is gaining in importance as an engine of Canada's population growth, and since 1995/1996 it has consistently been the main source of that growth³. In 2013/2014, net international migration was responsible for almost two-thirds (66.5%) of population growth in Canada. By comparison, net international migration accounted for 43.6% of

population growth between 1983/1984 and 1994/1995. For the year ending June 30, 2014, net international migration was estimated at 256,900, about double the figure for natural increase (+129,200).

3. For intercensal periods, total growth is not only made of natural increase and net international migration. It also includes residual deviation which is the difference between population growth calculated using censal estimates of population between two dates and that obtained by the sum of the components of growth for the same period.

Chart 1.3
Factors of population growth, 1983/1984 to 2013/2014, Canada

1.1.4 More than 85% of Canadians were living in four provinces

On July 1, 2014, more than 85% of Canadians were living in four provinces: Ontario (38.5%), Quebec (23.1%), British Columbia (13.0%) and Alberta (11.6%). Among the provinces, Ontario was still the

province with the largest population with 13.7 million people while Prince Edward Island was the smallest with 146,300 people. With close to 8.2 million people, Quebec ranked second in terms of population, followed by British Columbia with 4.6 million and Alberta with 4.1 million.

Territories	76,249	0.3	116,718	0.3	40,469	53.1

1. Before 1991, only combined estimates of Northwest Territories and Nunavut are available.

2. For the calculation, the population of Nunavut and NWT has been used for 2014

1.1.5 Population share of Quebec has decreased the most over the last 30 years

In the last 30 years, the combined populations of the Prairie provinces and British Columbia have grown substantially (+50.3%), while the Atlantic provinces have seen their populations increased only slightly (+2.8%). By comparison, Canada's population increased by 38.8% during this period. Among the provinces, Alberta has recorded the strongest growth since 1984, with an increase of 72.2% which was almost two times higher than the national average. Since 1984, population shares have only grown in a few provinces, Ontario (+2.7 percentage points), Alberta (+2.2 percentage points) and British Columbia (+1.5 percentage points). On the other hand, Quebec was the province where the population share has decreased the most over the last 30 years, by 2.8 percentage points, to 23.1% as of July 1st 2014. Population shares for Saskatchewan and Manitoba have also decreased over that period, from 4.0% to 3.2% and from 4.2% to 3.6%, respectively.

Regional differences in the intensity of the population growth in the past 30 years can be attributed to

several factors. For example, interprovincial migration was in general more favourable to Alberta and British Columbia and less favourable to the Atlantic Provinces, Manitoba and Saskatchewan. Natural increase was generally higher in the Prairie Provinces and the territories and lower in the Atlantic provinces. Finally, a greater influx of international migrants was observed in Ontario and British Columbia.

1.1.6 Regional profile

1.1.7 Population growth was higher in the Western provinces and Nunavut

Preliminary estimates⁴ for 2013/2014 indicate that population growth⁵ was negative in Newfoundland and Labrador (-0.2%) and New Brunswick (-0.2%) and in general high in the Western provinces and Nunavut. Growth was above the national level (+1.1%) in Nunavut (+3.2%), Alberta (+2.8%), Saskatchewan (+1.7%) and Manitoba (+1.3%). Population growth changed from positive in 2012/2013 to negative in 2013/2014 in the Northwest Territories, from 0.5% to -0.5 % and in Newfoundland and Labrador, from 0.3% to -0.2 %. At the opposite, the growth has accelerated in Nunavut, from 2.0% to 3.2% and in Prince Edward Island, from 0.2% to 0.5%.

4. Preliminary postcensal estimates are subject to revision. Future updates could affect this analysis.

5. A rate higher than -0.1 % and lower than 0.1 % is, for the rest of the analysis, considered being not significant.

Chart 1.4

Population growth rate, 2012/2013 and 2013/2014, Canada, provinces and territories

1.1.8 International migration was a key factor of growth in many provinces

In 2013/2014, population growth resulted mainly from net international migration for Prince Edward Island, Quebec, Manitoba, Alberta and British Columbia. In the territories, natural increase played a key role

either to balance for net losses in interprovincial migrations, for the Northwest Territories or the increase population growth, for Nunavut. On the other hand, natural increase has remained fairly low in the Atlantic Provinces and was negative in Newfoundland and Labrador, for a second year in a row.

Chart 1.5

Factors of the population growth, 2013/2014, Canada, provinces and territories

1.1.9 Comparison of provinces and territories with the states in the United States: important differences

A comparison of the demographic indicators for provinces and territories in Canada with the 50 American states⁶ provides a better understanding of Canada's diversified population dynamics. The populations of some provinces and territories are among the fastest growing regions

in North America (excluding Mexico) while others are registering the largest decreases. Nunavut registered the largest growth, at 3.2% in the last year. It was followed by North Dakota (+3.1%) and Alberta (+2.8%), two regions associated with extensive oil and gas extraction economic activities. On the other hand, among the 63 regions under consideration, the populations of the Northwest Territories (-0.5%), Newfoundland and Labrador (-0.2%), New Brunswick (-0.2%) and West Virginia (-0.1%) registered population decreases.

6. For the United States, the latest data are used for this comparison which are as of July 1st 2013.

Chart 1.6**Population growth rate, most recent annual period available¹ Canada's provinces and territories and U.S. states**

provinces and U.S. states

1. For Canada, the most recent annual period available extends from July 1, 2013 to June 30, 2014. For United States, the most recent annual period available extends from July 1, 2012 to June 30, 2013.

Note: Regions are ranked in descending order of the annual population growth rate. Only regions with highest and lowest values are presented and separated by (...).

Sources: Statistics Canada, U.S. Census Bureau.

1.1.10 Factors of demographic growth

At the national level, population growth is the result of two factors: natural increase and net international migration. Natural increase is the difference between the number of births and deaths. Net international migration basically refers to the number of moves

between Canada and abroad, accompanied by a change in usual place of residence; it consists of the following components: immigration, emigration, returning emigrants, net temporary emigration and net non-permanent residents.

Text table 1.2

Factors of demographic growth, 2003/2004 to 2013/2014, Canada

	Population at beginning period	Natural increase		Net international migration			Residual deviation	Population at ending period
		Births	Deaths	Immigration	Total ¹	Net		
					emigration	non-permanent residents

1. Total emigration is obtained as follows: difference between emigration and returning emigration to which is added net temporary emigration

Note(s): Figures may not add exactly due to rounding

1.1.11 Natural increase

According to preliminary data, natural increase for the year ending June 30, 2014 was estimated at 129,200, slightly down from 130,900 in the previous year. In 2013/2014, natural increase resulted from the difference between 385,900 births and 256,700 deaths estimated for that year. The number of persons who were added by natural increase in 2013/2014 declined by approximately 1,600 compared with 2012/2013. This is due to the fact that deaths increased more rapidly than births during this period.

The rate of natural increase was 0.4% in 2013/2014, similar to the level observed since 2005/2006. Overall, natural increase was low in the Atlantic Provinces and much higher in the territories. For a second consecutive year, Newfoundland and Labrador registered a negative natural growth rate (-0.1%). Nunavut recorded the strongest natural increase (+2.0%) in Canada while Alberta had the strongest (+0.8%) among the provinces. Indeed, Alberta has held this title continuously since 1980/1981.

1.1.12 Births

For the year ending June 30, 2014, the estimated number of births was 385,900 in Canada, a slight increase from the previous year (383,100). In 2013/2014, the crude birth rate, which is the ratio between births and the average population during the period, was estimated at 1.1%. In the past year, these birth rates were higher in the territories and the Prairies provinces and lower in the Atlantic provinces. The highest birth rate was observed in Nunavut (+2.5%), while among the provinces, Alberta and Saskatchewan led the way (+1.4%), closely followed by Manitoba (+1.3%). Birth rates of these areas were fuelled by strong fertility rates, as illustrated by the latest total fertility rates (TFR).⁷ For a detailed analysis of demographic growth for all components, please refer to the *Report on the Demographic Situation in Canada*⁸ (Catalogue no. 91-209-X).

1.1.13 Deaths

For the year ending June 30, 2014, the estimated number of deaths was 256,700 in Canada, a slight increase from last year (252,200). This increase in the number of deaths is mainly explained by demographic growth but is also related to population ageing. This means that a greater share of the population is in the older age groups and is then exposed to a higher level of mortality.

In 2013/2014, the crude mortality rate, namely, the ratio between deaths and the average population during the period was estimated at 0.7% in Canada. Compared with 2012/2013, the number of deaths was higher in all provinces and territories, with the exception of Quebec. In Canada, the highest mortality rates were observed in all Atlantic provinces (+0.9%) and in Saskatchewan (+0.9%) while the Northwest Territories and Nunavut had the lowest rates (+0.5%). Among provinces, Alberta once again registered in 2013/2014 the lowest mortality rate in Canada (+0.6%), for a 33rd consecutive year. This is related to the fact that Alberta has the youngest population of any province.

7. <http://www.statcan.gc.ca/pub/91-209-x/2013001/article/11784-eng.htm>

8. <http://www.statcan.gc.ca/pub/91-209-x/91-209-x2013001-eng.htm>

1.1.14 Net international migration

Net international migration was estimated at 256,900 for the year ending June 30, 2014, down from the previous year (+271,300). The net international migration rate reached 0.7% in 2013/2014, a slightly lower level than observed in the previous year (0.8%). In 2013/2014, the net international migration rate was above the national average in five provinces: Manitoba (+1.2%), Saskatchewan (+1.1%), Prince Edward Island (+1.1%), Alberta (+1.0%) and British Columbia (+0.8%).

1.1.15 Immigrants

Nearly 267,700 immigrants took up residence in Canada in the year ending June 30, 2014, a number exceeding 250,000 for a fifth year in a row and higher than compared to 2012/2013 (263,200). In 2013/2014, the immigration rate was estimated at 0.8% in Canada. Among the provinces and territories, the highest immigration rates were seen in Manitoba (+1.2%), Saskatchewan (+1.1%), Alberta (+1.0%), Prince Edward Island (+1.0%) and Yukon (+1.0%).

In recent decades, the regional distribution of immigration in Canada has changed. In 2013/2014, Ontario continued to be the Canadian province receiving the most immigrants. However, this trend has tended to diminish in the last few years. On average between 1983/1984 and 2007/2008, Ontario welcomed between 45.4% and 59.6% of all immigrants coming to Canada. In 2013/2014, only 38.0% of Canada's immigrants settled in that province. This was its lowest proportion since 1971/1972, which is the first year covered by the current demographic accounting system.

Three provinces received a record number of immigrants in 2013/2014: New Brunswick (2,300), Saskatchewan (12,300) and Alberta (41,000). For a fifth consecutive year, more than 50,000 immigrants settled in Quebec. Compared with 2012/2013, fewer immigrants settled in Ontario and Quebec in 2013/2014 with respectively a drop of 4,300 and 4,100 immigrants, respectively.

1.1.16 Net non-permanent residents

Net non-permanent residents represent the change in the number of non-permanent residents between two dates. For the year ending June 30, 2014, net non-permanent residents (NPR) stood at +32,700, down 35.8% from the level (+51,000) observed in 2012/2013. Net non-permanent residents were positive in 2013/2014 in all provinces. The highest number of net non-permanent residents was observed in Ontario (+11,400), British Columbia (+11,400) and Alberta (+6,700). In relative term, the net NPR have grown more rapidly than nationally (+0.1%) in Prince Edward Island (+0.2%), Alberta (+0.2%) and British Columbia (0.2%).

1.1.17 Emigration

Preliminary estimates indicate that in 2013/2014, 61,900 Canadians emigrated, 36,800 emigrants returned to Canada on a permanent basis and net temporary

emigration stood at 18,400. Based on these three components, total emigration⁹ can therefore be estimated at nearly 43,500 for the year ending June 30, 2014 and concentrated in three provinces, Ontario (+17,000), British Columbia (+13,200) and Quebec (+5,700). The net emigration rate was above the national average (+0.1%) only in British Columbia (+0.3%) and Yukon (+0.3%).

1.1.18 Net interprovincial migration

At the provincial and territorial level, population growth results not only from natural increase and net international migration, but also from net interprovincial migration. This is the change in the size of a population during a given period as a result of population movements between Canada's provinces and territories, accompanied by a change in usual place of residence.

9. Total emigration is obtained as follows: difference between emigration and returning emigration to which is added net temporary emigration.

Chart 1.7
Interprovincial migration by province and territory, 2013/2014

For the year ending June 30, 2014, preliminary estimates of net interprovincial migration were positive for only three provinces: Alberta (+38,700 or 1.0%), Saskatchewan (+1,200 or 0.1%) and British Columbia (+2,300 or 0.0%). Net interprovincial migration has gone from a loss of 1,900 people in 2012/2013 to a gain of 2,300 people in 2013/2014 for British Columbia. On the other hand, net losses have increased over

the last two years, in Quebec and in New Brunswick. For these two provinces, net losses in migration in 2013/2014 have increased with Ontario, Alberta and British Columbia compared with last year. Finally, Alberta has recorded in 2013/2014 its highest gains in 8 years while Prince Edward Island (-1,000) and New Brunswick (-4,100) have experienced their largest net losses since 1980/1981.

1. Preliminary estimates based on data from the Canada Child Tax Benefit (CCTB) Program and F_{jk} factors calculated using 2010/2011, 2011/2012 and 2012/2013 tax file data from Canada Revenue Agency.

Section 2

Population by age and sex

This section presents an analysis of the population estimates by age and sex for Canada, the provinces and territories on July 1, 2014.

2.1 National portrait

2.1.1 Baby-boomers accelerate Canada's population aging

In recent decades, one of the major changes associated with Canada's age-sex structure is population aging. The age pyramid below (Figure 2.1) illustrates the aging of Canada's population by comparing the population's age-sex structures on July 1 of 1984 and 2014. In particular, the pyramid shows the impact of the baby-boomer cohort, born between 1946 and 1965, on Canada's age structure. The movement of the baby boomers through the age structure is especially apparent in this age-sex

pyramid, as the base of the pyramid is narrower and the top broader in 2014 than they were in 1984. Thirty years ago, baby boomers were young adults between 19 and 38 years of age; now they are between 49 and 68. The pace of population aging will remain rapid until 2031, when the last baby boomers turn 65.

The children of the baby boomers, born between 1972 and 1992 and now between 22 and 42 years of age, are the largest cohort, making up 28.6% of Canada's population. The other cohorts are, in descending order of size, baby boomers (26.9%), members of Generation Z (born since 1993; 24.8%), baby busters (born between 1966 and 1971; 8.2%), parents of baby boomers (born between 1919 and 1940; 7.4%), members of the Second World War generation (born between 1941 and 1945; 3.9%) and people born before 1919 (0.1%).

Figure 2.1

Age pyramid of population estimates as of July 1, 1984 and 2014, Canada

2.1.2 One Canadian in two is at least 40

In 2014, one Canadian in two was at least 40.4 years of age. The median age of Canada's population has risen by 9.8 years in the past 30 years (see Chart 2.1). The median age was higher for women (41.2 years) than for men (39.5 years). This difference is due to a persistent, though shrinking, gap in life expectancy

in favour of females. According to the latest data, life expectancy was 83.6 years for females and 79.3 years for males¹

1. Statistics Canada. 2013. Life Tables, Canada, Provinces and Territories 2009 to 2011. Statistics Canada Catalogue no. 84-537-X. <http://www.statcan.gc.ca/pub/84-537-x/84-537-x2013005-eng.htm> (accessed on August 28, 2014).

Chart 2.1
Median age by gender, 1984 to 2014, Canada

2.1.3 The proportion of the 65-and-over population is approaching that of the under-15 population

According to preliminary estimates, 15.7% of the Canadian population, nearly one person in six, was 65 or older on July 1, 2014. This proportion has been rising steadily since the mid-1960s because fertility rates have been below the replacement level and life expectancy has been increasing. By comparison, the proportion of Canadians aged 65 and over was 10.0% 30 years earlier, on July 1, 1984. Over the last 30 years, this age group has more than doubled in size, from 2,563,300 to 5,585,300.

Moreover, during the last annual period, the growth rate of the 65-and-over group was 3.7%, more than triple the growth rate of the population as a whole. The annual growth rate of this age group has been

accelerating since the beginning of the decade, specifically since 2011, when the first baby boomers began turning 65. According to the most recent population projections for Canada,² seniors could make up between 23.8% and 27.8% of the population by 2063, about 50 years from now.

On July 1, 2014, there were 5,708,700 people under the age of 15 in Canada, 16.1% of the population. While the number of people under 15 has remained relatively stable over the last 30 years, their proportion of the total population has fallen 5.5 percentage points since 1984 (21.6%). This decline in their demographic weight is mainly attributable to the more rapid growth rate 65-and-over age group. As more and more members of the baby-boomer cohort reach 65, the number of people aged 65 and over will continue getting closer to the number of people aged 15 and under, probably surpassing it by 2015 or 2016.²

The 15-to-64 group, with a growth rate of 0.6% during the last annual period, totalled 24,246,500 on July 1, 2014, 68.2% of Canada's population.

2. Population Projections for Canada (2013-2063), Provinces and Territories (2013-2038), Statistics Canada Catalogue no. 91-520-X. Every projection scenario was reviewed.

Chart 2.2

Population aged less than 15 years old and 65 years old and over, 1984 to 2044, Canada

Note: From 1984 to 2014, population estimates. From 2015 to 2044, Population Projections for Canada (2013 to 2063), Provinces and Territories, (2013 to 2038), various scenarios, Catalogue no. 91-520-X.

2.1.4 The proportion of the 55-to-64 age group surpasses that of the 15-to-24 age group for the first time

For the first time since 1971, the first year covered by the current system of demographic accounts, population estimates show that there are more persons aged 55 to 64, the age when people typically leave the labour force, than those aged 15 to 24, the age when people typically enter the labour force. On July 1, 2014, there were 4,610,800 people between 15 and 24 in Canada, compared with 4,725,400 people between 55 and 64. Thirty years ago, for every person aged 55 to 64, there were 2 people aged 15 to 24; this ratio has now fallen by half, to just below 1.

3. The first year for which population estimates for centenarians are available.

4. Statistics Bureau of Japan. Population by Age (Single Year), Sex and Sex ratio - Total population, Japanese population, October 1, 2013. <http://www.e-stat.go.jp/SG1/estat/ListE.do?lid=000001118081> (accessed on August 28, 2014).

2.1.5 The number of centenarians continues to grow rapidly

Because of rising life expectancy, increasing numbers of Canadians are reaching the age of 100. On July 1, 2014, according to preliminary estimates, there were more than 7,600 centenarians in Canada, around 21 centenarians per 100,000 persons. In 2001,³ the ratio was only half as large, at 11 centenarians per 100,000 persons. By comparison, in 2013, there were about 43 centenarians per 100,000 persons in Japan.⁴ More women than men reach the age of 100 because of lower mortality levels at all ages. In 2014, most centenarians were women (87.6%).

2.1.6 The 85-and-over population has the highest growth rate in the last 30 years

Between 1984 and 2014, all five-year age groups over 40 had higher growth rates than the national average. This reflects the accelerating population aging in Canada, which will continue in the years to come. The highest growth rates are in the 80-and-over

population. The age group that had the largest increase between 1984 and 2014 (+239.8%) was the 85-and-over group (Chart 2.3), expanding from 215,100 in 1984 to 730,900 in 2014. The second-highest rate of increase was in the 80-to-84 group (+152.6%). Four other age groups doubled or more in size over the

last 30 years: 50 to 54 (+120.4%), 55 to 59 (+111.9%), 65 to 69 (+111.4%) and 75 to 79 (+101.3%). With the exception of the 75-to-79 group, the sharp increase in the size of these age groups is due to the influx of baby boomers. Only one age group decreased in size between 1984 and 2014: the 20-to-24 group, with a growth rate of -1.7%.

Chart 2.3

Population variation by age group between 1984 and 2014, Canada

2.1.7 Population aging is less advanced in Canada than in most G7 countries

Population aging is a common phenomenon around the world; the proportion of the 65-and-over population has increased in all G7 countries over the last 30 years. Among G7 members, Canada has one of the lowest proportions of people aged 65 and over. In contrast, Japan has one of the oldest populations in the world and the highest proportion of people aged 65 and over in the G7, just over one person in four (26%).

The proportion of the under-15 population is higher in Canada (16.1%) than in Japan (13%), Germany (13%) and Italy (14%). The fact that Canada has proportionally more people aged 0 to 14 than these three countries is due in part to higher fertility in

Canada. However, the proportion of children is lower in Canada than in the United States (19%), the United Kingdom (18%) and France (18%), where fertility is closer to the replacement level.

In addition, Canada is the G7 country that has the largest proportion of working-age people, with 68.2% of its population in the 15-to-64 age group. Japan is the G7 country with the lowest proportion, 61%. The fact that the baby boom was larger in Canada than in most other G7 countries accounts, in part, for Canada's higher proportion of people aged 15 to 64. As more and more Canadian baby boomers reach the age of 65, the proportion of the working-age population in Canada will move closer to the proportions observed in the other G7 countries.

Text table 2.1**Age distribution of the population, Canada and other G7 countries, 2014**

	0 to 14 years	15 to 64 years	65 years and over
	%		
Canada	16.1%	68.2%	15.7%
France	18%	64%	18%

United Kingdom	18%	65%	17%
United States	19%	67%	14%

Source(s): International data come from the 2014 World Population Data Sheet of the Population Reference Bureau.

2.1.8 There are slightly more women than men in Canada

In addition to aging, the population's sex structure is also changing (Chart 2.4). For the Canadian

Chart 2.4**Sex ratio by age group, 1984 and 2014, Canada**

number of males for 100 females

population as a whole, the sex ratio was estimated at 98 males per 100 females on July 1, 2014, compared with 99 males per 100 females in 1984. Males outnumbered females in the 0-to-14 and 15-to-39 age ranges, because of the sex ratio at birth, which averages 105 males per 100 females. However, when people reach their mid-fifties, the number of males starts to fall slightly below the number of females, because of a higher male mortality rate. This gap widens at more advanced ages, so that in the 65-to-79 group, there were an estimated 91 males per 100 females on July 1, 2014. This is nevertheless an increase from 1984, when there were only 79 males for every 100 females. In the 80-and-over population, there were an estimated 62 males per 100 females on July 1, 2014, compared with only 53 per 100 on July 1, 1984. The estimate for centenarians in 2014 was just 14 males per 100 females.

2.1.9 Portrait of the provinces and territories

2.1.10 Uneven population aging across Canada's provinces and territories

The age structure of the population varies appreciably from one province or territory to another. In most cases,

these differences are due to dissimilarities in current and past fertility and immigration levels, and to variable interprovincial migration levels. On July 1, 2014, Canada's youngest populations were in the territories and the Prairies, and the oldest populations were in the Atlantic provinces (Table 2.2 and Figure 2.2).

Figure 2.2

Age pyramid of population estimates as of July 1, 2014; comparison of four major regions of Canada

The age pyramid opposite (Figure 2.2) shows the population structure of the territories, the Prairie provinces, the Atlantic provinces and Canada's three most populous provinces. These four regions are compared since, within each region, there are a number of common characteristics with regard to age-sex structure.

First, the much wider base of the territories' pyramid reflects the preponderance of young people in the population of northern Canada. Conversely, the narrower peak of the pyramid indicates that the proportion of seniors is smaller than in the rest of Canada. This situation is attributable to the higher fertility and shorter life expectancy in northern Canada.

The age structure of the three Prairie provinces is distinctly different from those of the other seven provinces of Canada. Higher fertility accounts for the higher proportion of young people in the Prairies, reflected in the wider base of the age pyramid. In addition, the 20-to-39 age group is prominent in the Prairie provinces' population, as it makes up a substantially larger proportion of the population than in other provinces. As a result, there are more people in the younger segment of the labour force (ages 15 to 39) than in the older segment (ages 40 to 64) in the Prairies. The opposite is true in Canada's other seven provinces. In addition, the top of the Prairies' age pyramid narrows more sharply than that of the other regions. The lower

proportion of seniors in the Prairie region's population is due in part to higher fertility levels, international immigration and interprovincial migration gains.

In the Atlantic provinces, population aging is more advanced than in any other part of Canada, as shown by the broad peak of its age pyramid. The larger demographic weight of the baby boomers in the Atlantic provinces is also evident in Figure 2.2, in the form of a bulge between the ages of 49 and 68. This cohort is also easy to identify in the age pyramids of Canada's other regions, but it is much more conspicuous in the Atlantic provinces' pyramid. The reason for this is that the younger cohorts are proportionally smaller than in the rest of Canada, as a result of lower fertility and many years of interprovincial migration losses.

Though very different in various respects, the three most populous provinces have a number of demographic similarities. Each one has one of the three largest census metropolitan areas in Canada (Toronto in Ontario, Montréal in Quebec, and Vancouver in British Columbia). The majority of immigrants to Canada settle in these provinces, and their levels of population aging are comparable. The age structure of Canada's three most populous provinces is mid-way between that of the Prairie provinces and that of the Atlantic provinces. Baby boomers make up a smaller proportion of the population in these provinces than in the Atlantic provinces, but a larger proportion than in the Prairies. In the three most populous provinces, the demographic weight of the younger cohorts is higher than in the Atlantic provinces, but lower than in the Prairie provinces.

Text table 2.2

Population estimates,¹ age distribution and median age as of July 1, 2014, Canada, provinces and territories

	Population	0 to 14 years	15 to 64 years	65 years and over	Median age
	number	%			years
Canada	35,540,419	16.1	68.2	15.7	40.4
Newfoundland and Labrador	526,977	14.4	67.9	17.7	44.6
Prince Edward Island	146,283	15.9	66.2	17.9	43.3

Northwest Territories	43,623	21.4	72.0	6.6	32.9
Nunavut	36,585	31.1	65.2	3.7	25.5

1. Preliminary postcensal estimates.

Note(s): Figures in percent may not add up to 100% as a result of rounding.

2.1.11 The population is oldest in the Atlantic provinces and youngest in the Prairies and the territories

Nunavut had the youngest population in Canada on July 1, 2014, with a median age of 25.5 and a proportion under age 15 of 31.1%. The Northwest Territories also had a high proportion of children, at 21.4%. The province with the largest proportion of people under 15 was Saskatchewan (18.9%), and the province with the lowest median age (36.0) was Alberta. Manitoba's population was also appreciably younger than the national average. People under 15 made up 18.7% of its population, the second-highest

proportion for a Canadian province, and the median age was 37.7, 2.7 lower than the national median age (40.4).

The proportion of the 65-and-over population was higher in each of the four Atlantic provinces than in any other province or territory of Canada. The highest proportion in the country was 18.3%, in New Brunswick and Nova Scotia. Newfoundland and Labrador had the highest median age in Canada, at 44.6, 4.2 higher than the national average. New Brunswick was close behind, with a median age of 44.3. Prince Edward Island's population was older than the national average, but the province had a lower median age

(43.3) and a higher proportion under age 15 (15.9%) than any other Atlantic province.

The populations of Quebec and British Columbia were slightly older than the national population. Their proportion of people 65 and over was slightly more than one percentage point above the national average (17.1% and 17.0% respectively, compared with 15.7% for Canada), and their median age was a year and a half higher than the median age for the entire country (41.8 and 41.9 respectively, compared with 40.4 for Canada). The age structure of Ontario's population was very similar to that of the Canadian population.

The proportions of the province's population that were between 0 and 14 (16.0%) and 65 or over (15.6%) differed from the Canadian averages by just 0.1 percentage points.

The working-age populations (ages 15 to 64) of Yukon and the Northwest Territories were proportionally the largest in Canada, at 72.9% and 72.0% respectively, compared with the national average of 68.2%. Alberta was the province with the largest proportion of people aged 15 to 64 (70.4%), in part because of the influx of working-age people from other parts of Canada and other countries.

Chart 2.5

Ratio of the number of people aged 15 to 24 and those aged 55 to 64, 2014, Canada, provinces and territories

The ratio of the number of persons aged 55 to 64, the age when people typically leave the labour force, to the number of those aged 15 to 24, the age when people typically enter the labour, varies considerably across Canada. On July 1, 2014, it was only 0.71 in Newfoundland and Labrador, the lowest in the country. In the Northwest Territories and Nunavut, it was 1.41 and 2.70 respectively. The number of people aged 15 to 24 was still larger than the number of people aged 55 to 64 in four provinces: Manitoba, Alberta, Saskatchewan and Ontario (with ratios of 1.14, 1.12, 1.09 and 1.04 respectively). The ratio was 0.86 in Quebec and 0.93 in British Columbia.

2.1.12 Some provinces are aging much faster than others

The pace of population aging varies substantially across Canada. To illustrate the differential speed of this demographic process, Chart 2.6 shows the length of time that it took or is projected to take for the proportion of people aged 65 and over to increase from 7.5% to 15.0% (that is, for the proportion of seniors to double).

The 15% seniors threshold was reached by all Canadian provinces except Alberta and Manitoba⁵ over the last eight years. It took more than 80 years for the proportion of seniors to increase from 7.5% to 15.0% in Nova Scotia and Prince Edward Island, whereas the transition was made in just 34 years in Quebec and only 29 years in Newfoundland and Labrador. In comparison, 75 years were required for the proportion of seniors to double in Ontario, 73 years in British Columbia and 69 years in Manitoba. This shows that the size of the baby boom and baby bust

was not uniform across Canada; in fact these events were larger in both Quebec and Newfoundland and Labrador.

At the national level, 65 years elapsed between the time the proportion of people aged 65 and over in the population reached 7.5% (in 1948) and the time it reached 15.0% (in 2013). Although Alberta would be the last province in which the proportion of seniors makes it to 15.0% (between 2023 and 2026), the doubling period could be the third-shortest in the country. In the Northwest Territories and Nunavut, the proportion of seniors had not yet reached 7.5% on July 1, 2014.

5. Saskatchewan's proportion of seniors reached 15.0 % in 2006 but has fallen slightly below that level since then.

Chart 2.6

Duration needed for the proportion of the population aged 65 and over to double, from 7.5% to 15.0%, Canada, provinces and territories

Notes: From 1921 to 2014, population estimates. From 2015 to 2038, Population Projections for Canada (2013 to 2063), Provinces and Territories, (2013 to 2038), various scenarios, Catalogue no. 91-520-X. Population estimate and projections are as of July 1 for years 1971 and over. Population estimates prior to 1971 are as of June 1 and data are adjusted for census net undercoverage and do not include non-permanent residents.

2.1.13 Comparison of the provinces and territories with the states of the United States: Substantial differences

A comparison of the demographic indicators for Canada's provinces and territories with those of the 50 American states⁶ can provide a better understanding of Canada's diverse population dynamics. Certain provinces and territories are either the fastest growing or the slowest growing regions in North America (excluding Mexico).

6. The data for the United States as of July 1, 2013 were used for the comparative analysis, as they were the most recently available.

In terms of the proportion of persons aged 65 and older, the four Atlantic provinces were among the oldest regions in North America: only Florida (18.7%) had a higher proportion of seniors. In addition, the proportion of persons aged 65 and older was also high in Quebec (17.1%) and British Columbia (17.0%), these provinces being surpassed by Florida and two other states: Maine (17.7%) and West Virginia (17.3%).

At the opposite end of the spectrum, Nunavut (3.7%) and the Northwest Territories (6.6%) were the regions with the lowest proportions of seniors aged 65 and over in North America. Among the provinces, the youngest population was in Alberta (11.4%), its proportion of seniors being lower than in all states except three: Alaska (9.3%), Utah (9.8%) and Texas (11.3%).

Chart 2.7

Proportion of the population aged 65 and over, 2014,¹ Canada's provinces and territories and U.S. States

regions

1. The data for the U.S. States as of July 1, 2013 were used for the comparative analysis, as they were the most recently available.

Note: Regions are ranked in descending order of the proportion of the population aged 65 and over. Only regions with highest and lowest values are presented.

Sources: Statistics Canada, U.S. Census Bureau.

Similar observations can be made regarding the proportion of people under the age of 15, although the values are generally higher south of the Canadian border because of the higher fertility of the U.S. population. Five Canadian provinces have fewer people aged 0 to 14 than any of the 50 U.S. states:

Nova Scotia (14.1%), Newfoundland and Labrador (14.4%), New Brunswick (14.6%), British Columbia (14.6%) and Quebec (15.4%), where the proportion of children is lower than in Vermont, the state with the lowest proportion (15.9%). In contrast, Nunavut has a higher proportion of children than any other region

of Canada and the United States, at 31.1%, nearly five percentage points more than Utah (26.2%), which ranks second.

Chart 2.8

Proportion of the population aged 0 to 14 years, 2014,¹ Canada's provinces and territories and U.S. States

regions

1. The data for the U.S. States as of July 1, 2013 were used for the comparative analysis, as they were the most recently available.

Note: Regions are ranked in descending order of the proportion of the population aged 0 to 14 years. Only regions with highest and lowest values are presented.

Sources: Statistics Canada, U.S. Census Bureau.

Lastly, Canadian provinces and territories differ from the U.S. states by virtue of the large proportion of the working-age population (ages 15 to 64). In Yukon (72.9%), the Northwest Territories (72.0%) and Alberta (70.4%), this proportion is higher than in any of

the 50 states. Moreover, more than two-thirds of the population is between the ages of 15 and 64 in 10 of Canada's 13 provinces and territories, compared with just 15 of the 50 U.S. states.

2.1.14 Sex ratio

The populations of the provinces and territories differ not only in their age structure but also in their sex structure (Chart 2.10). On July 1, 2014, the Atlantic provinces and Ontario had the lowest sex ratio, and the territories had the highest ratios. In addition, Saskatchewan and Alberta were the only two provinces with a slightly larger number of males than females. This situation is mostly due to the higher sex ratio in their working-age population, which is partly attributable to the fact that interprovincial migration brings more men to these two provinces.

In the 0-to-14 age group, the sex ratio was greater than 1 in every Canadian province and territory, because the number of male births normally exceeds the number of female births. In the 65-and-over population, the sex ratios for the provinces ranged between 80 and 90 men per 100 women. In the territories, on the other hand, there were more elderly men than elderly women, partly because of the shorter life expectancy in this part of Canada.

Chart 2.10
Sex ratio by age group, 2014, Canada, provinces and territories

number of males for 100 females

1. Period from July 1 to June 30.

Note(s): Total net migration is updated for 2011/2012 and 2012/2013 and preliminary for 2013/2014.

Methodology

This document describes the concepts, data sources and methodology used to produce the population estimates. Population estimates are produced to measure the population counts according to various characteristics and geographies between two censuses. The demographic estimates are the official population estimates at the national, provincial and territorial levels.

Postcensal estimates are based on the 2011 Census.

Specific information regarding age and sex distributions is provided in boxes.

Population Estimates

Estimates of the total population

Types of estimates

Population estimates can be either intercensal or postcensal. Intercensal estimates are produced using counts from two consecutive censuses adjusted for census net undercoverage (CNU)¹ and postcensal estimates. The production of intercensal estimates involves updating the postcensal estimates using the counts from a new census adjusted for CNU.¹

Postcensal estimates are produced using data from the most recent census adjusted for CNU¹ and the components of demographic growth. In terms of timeliness, postcensal estimates are more up-to-date than data from the most recent census adjusted for CNU,¹ but as they get farther from the date of that census, they become more variable.

Levels of estimates

Updating population estimates between censuses entails the use of data from administrative files or surveys. The quality of population estimates therefore depends on the availability of a number of administrative data files that are provided to Statistics Canada by Canadian and foreign government departments. Since some components are not available until several months after the reference date, three kinds of postcensal estimates are produced: preliminary postcensal (PP), updated postcensal (PR) and final postcensal (PD). The time lag between the reference date and the release date is three months for preliminary estimates and two to three years for final estimates. Though it requires more vigilance on the part of users, the production of three successive series of postcensal estimates is the strategy that best satisfies the need for both timeliness and accuracy of the estimates. All tables indicate the level of the estimates they contain.

Calculation of postcensal population estimates

Population estimates – preliminary, updated and final – are produced by the component method. This method consists of taking the population figures from the most recent census, adjusted for the CNU¹ (census undercoverage minus census overcoverage), and adding or subtracting the number of births, deaths, and components of international and interprovincial migration.

1. In this case, the adjustment for the census net undercoverage also includes the incompletely enumerated Indian reserves (IEIR).

A. Provincial / territorial estimates of total population

Population estimates are produced for the provinces and territories first; then they are summed to obtain an estimate of the population of Canada.

The component-method formula for estimating the total provincial / territorial populations is as follows:

Figure 3

Component-method formula for estimating total population

$$P_{(t+i)} = P_{(t)} + B_{(t,t+i)} - D_{(t,t+i)} + I_{(t,t+i)} - [E_{(t,t+i)} + \Delta TE_{(t,t+i)}] + RE_{(t,t+i)} + \Delta Ninter_{(t,t+i)} + \Delta N_{(t,t+i)} - Resid_{(t,t+i)}$$

where, for each province and territory:

$(t, t + i)$	=	interval between times t and $t+i$;
$P_{(t+i)}$	=	estimate of the population at time $t+i$;
$P_{(t)}$	=	base population at time t (census adjusted for (CNU) ¹ or most recent estimate);
B	=	number of births;
D	=	number of deaths;
I	=	number of immigrants;
E	=	number of emigrants;
ΔTE	=	net temporary emigration;
RE	=	number of returning emigrants;
ΔNPR	=	net non-permanent residents;
$\Delta Ninter$	=	net interprovincial migration;
$Resid$	=	residual deviation (for intercensal estimates).

B. Provincial / territorial estimates by age and sex

Postcensal population estimates by age and sex are produced by applying the component method to each age-sex cohort in the base population.

At age 0:

Figure 4

Component-method formula for estimating population at age 0

$$P_{(t+1)}^0 = B_{(t,t+1)} - D_{(t,t+1)}^{-1} + I_{(t,t+1)}^{-1} - [E_{(t,t+1)}^{-1} + \Delta TE_{(t,t+1)}^{-1}] + RE_{(t,t+1)}^{-1} + \Delta NPR_{(t,t+1)}^{-1} + \Delta Ninter_{(t,t+1)}^{-1} - Resid_{(t,t+1)}^{-1}$$

From 1 to 99 years:

Figure 5

Component-method formula for estimating population from age 1 to 99

$$P_{(t+1)}^{a+1} = P_{(t)}^a - D_{(t,t+1)}^a + I_{(t,t+1)}^a - [E_{(t,t+1)}^a + \Delta TE_{(t,t+1)}^a] + RE_{(t,t+1)}^a + \Delta NPR_{(t,t+1)}^a + \Delta Ninter_{(t,t+1)}^a - Resid_{(t,t+1)}^a$$

For 100 years and over:

Figure 6

Component-method formula for estimating population at age 100 years and over

$$P_{(t+1)}^{100+} = P_{(t)}^{99+} - D_{(t,t+1)}^{99+} + I_{(t,t+1)}^{99+} - [E_{(t,t+1)}^{99+} + \Delta TE_{(t,t+1)}^{99+}] + RE_{(t,t+1)}^{99+} + \Delta NPR_{(t,t+1)}^{99+} + \Delta Ninter_{(t,t+1)}^{99+} - Resid_{(t,t+1)}^{99+}$$

Figure 7

Legend for all ages

where, for each province and territory:

- $(t, t + 1)$ = interval between times t and $t+1$;
 a = age;
 $P_{(t+1)}$ = estimate of the population at time $t+1$;
 $P_{(t)}$ = base population at time t (census adjusted for (CNU)¹, or most recent estimate);
 B = number of births;
 D = number of deaths;
 I = number of immigrants;
 E = number of emigrants;
 ΔTE = net temporary emigration;
 RE = number of returning emigrants;
 ΔNPR = net non-permanent residents;
 $\Delta Ninter$ = net interprovincial migration;
 $Resid$ = residual deviation (for intercensal estimates).

C. Levels of estimates

The difference between preliminary² and final postcensal population estimates lies in the timeliness of the components. When all the components are preliminary, the population estimate is described as preliminary postcensal (PP). When they are all final, the estimate is referred to as final postcensal (PD). Any other combination of levels is referred to as updated postcensal (PR).

Base population and components of demographic growth

A. Base population

The base populations are derived from the quinquennial censuses between 1971 and 2011. The population universe of the 2011³ Census includes the following groups:

- Canadian citizens (by birth or by naturalization) and immigrants with a usual place of residence in Canada;
- Canadian citizens (by birth or by naturalization) and immigrants who are abroad either on a military base or attached to a diplomatic mission;
- Canadian citizens (by birth or by naturalization) and immigrants at sea or in port aboard merchant vessels under Canadian registry or Canadian government vessels;

2. Unless otherwise noted, the term *preliminary* include both preliminary and updated estimates

3. From 1991 to 2001 Census, "persons with a usual place of residence in Canada who hold Minister's permits (including extensions) and members of their families living with them" were included in the census universe.

- persons with a usual place of residence in Canada who are claiming refugee status and the family members living with them;
- persons with a usual place of residence in Canada who hold study permits and the family members living with them;
- persons with a usual place of residence in Canada who hold work permits and the family members living with them.

For census purposes, the last three groups are referred to as non-permanent residents (NPR). They have been included in the census universe since 1991 but foreign residents are not included. Foreign residents are persons who belong to the following groups:

- government representatives of another country attached to the embassy, high commission or other diplomatic body of that country in Canada, and members of their families living with them;
- members of the Armed Forces of another country who are stationed in Canada, and family members living with them;
- residents of another country visiting Canada temporarily (for example, a foreign visitor on vacation or on business, with or without a visitor's permit).

These base populations are adjusted as follows:

- adjustment of the population for CNU;
- addition of independent estimates for incompletely enumerated Indian reserves in 1991, 1996, 2001, 2006 and 2011;
- adjustment for early enumeration in 1991 and 1996 in parts of Northern Quebec, Newfoundland and Labrador, the Yukon and the Northwest Territories;
- addition of estimates of NPRs in 1971, 1976, 1981 and 1986. Since 1991, NPRs are included in the census universe;
- estimation of the July 1 base population by addition or subtraction of the components of growth between Census Day and June 30;
- demographic adjustment for old age population is an age structure adjustment of censal estimates for 2001, 2006 and 2011 by sex for each province and territory. These adjustments were performed from age 85 in 2001, from age 90 in 2006 and from age 95 in 2011.

Adjustment for the census net undercoverage (CNU)

The adjustment for CNU is important. CNU is the difference between the number of persons who should have been enumerated but were missed (undercoverage) and the number of persons who were enumerated but should not have been or who were counted more than once (overcoverage).

Coverage studies provide undercoverage estimates for the 1991, 1996, 2001, 2006 and 2011 censuses at the provincial and territorial levels, and for the 1971, 1976, 1981 and 1986 censuses at the provincial level only. Estimates of overcoverage at the provincial and territorial levels are available only for the last five censuses (1991, 1996, 2001, 2006 and 2011). Overcoverage for previous censuses was estimated by assuming that the overcoverage-to-undercoverage ratio for each census between 1971 and 1986 was the same as in 1991. The CNU for the Yukon and the Northwest Territories prior to 1991 was estimated by assuming that the ratio between the CNU for each territory and the 10 provinces for each census between 1971 and 1986 was the same as in 1991.

For consistency, the 1991 Census undercoverage and overcoverage were revised in 1998 to take into account the methodological improvements made in the 1996 Census coverage studies. This revision altered CNU in all censuses between 1971 and 1986. Similarly, the 1996 Census undercoverage and overcoverage were revised in 2003.

Various methods were used to produce the estimates of CNU by age and sex for 1991, 1996, 2001, 2006 and 2011. First, the national estimates of CNU based on the coverage studies by age and sex were smoothed. Then an Empirical Bayes regression model was used to generate the provincial and territorial estimates of CNU by broad age groups, and a synthetic model produced estimates by single year of age. Lastly, two-way raking⁴ was used to ensure that CNU estimates were consistent with the provincial and territorial CNU totals and the national estimates by age and sex.

For the 1971 to 1986 period, CNU estimates by age and sex were simply prorated to the revised CNU estimates for the total population.

Demographic adjustment for old age populations

Age structure analysis of recent censuses and population estimates showed that population at old ages, especially centenarians (population aged 100 years old and over), have been subject to overestimation issues. For older populations, the types of errors and the magnitude of their effect can vary from one census to another, from error of misreporting (voluntary and non voluntary) to errors emerging from data capture and processing errors.

When compared to 2011 Census figures, estimates of centenarians still based on 2006 Census were 29% higher for females and 88% higher for males. This indicated that the adjustments done to diminish the 2006 base population for ages 95+, which would make the 100+ population in 2011, were not sufficient. This led the Population Estimates Program (PEP) of Statistics Canada to review its method to adjust the base population's age structure. For example, with these new adjustments, the number of centenarians has been lowered in 2006 for both male and female, respectively from 830 to 595 (-39%) and from 3,891 to 3,784 (-3%).

Using death data and a combination of two methods, the extinct cohort method and the survival ratios method for non-extinct cohorts, the PEP has adjusted the age structure of the 2011 census population in order to overcome the overestimation of population at old ages observed in the 2006 cycle.

Assuming that these populations are not affected by migration, the principle of the extinct cohort method (Vincent, 1951) is simple. When all members of a given cohort have died (up until age 110), the numbers alive in a given year can be calculated by summing the deaths, beginning with the oldest. For non-extinct cohorts, the survival ratio method (Thatcher 1992; Thatcher and al. 2002; Andreev 2004) was used to estimate population in a similar way but under the assumption that deaths of non-extinct cohorts are distributed by age mainly like those who are extinct.

In order to assure coherence of estimates by cohort, the adjustment, name demographic adjustment, was produced to adjust censal estimates for 2001, 2006 and 2011 by age and sex for each province and territory. These adjustments were performed from age 85 in 2001, from age 90 in 2006 and from age 95 in 2011. The surplus populations among the oldest-old population were redistributed in population aged 5 to 74 years according to their relative weights for each province/territory and sex.

The robustness of this newly implemented method will be monitored through the 2011 cycle and researches to improve its fitness and coherence will be continued. A more complete description of the method will be incorporated in the first chapter (base population) of the methodological guide (catalogue no. 91-528-x) in the months to come.

4. Two-way raking is also referred to as the "Deming method", the "method of iterative proportions", and calibration (see Shryock, Siegel *et al.*, 1976: 547-549).

B. Births and deaths

The numbers of births and deaths are derived directly from the vital statistics database of Statistics Canada's Health Statistics Division. Although Statistics Canada manages the National system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting and processing the information from those administrative files. Under provincial / territorial vital statistics statutes (or similar legislation), all live births and all deaths must be registered, and all provinces and territories provide this information to Statistics Canada.

The vital statistics universe closely parallels the census universe. Both universes include the births and deaths of all Canadians, immigrants and non-permanent residents (NPR) and exclude foreign residents.

Vital statistics by province or territory of residence are used to produce our final estimates of births and deaths.

When there are no vital statistics, the number of births is estimated using fertility rates by the mother's age. The number of deaths is estimated by using mortality rates by age and sex. These methods are used to calculate preliminary² estimates.

Special treatment for preliminary² estimates for Quebec and British Columbia

Quebec and British Columbia provide their most recent estimates of births and deaths. The figures are used to produce preliminary² estimates. For the final estimates, the two provinces' births and deaths are derived from the vital statistics compiled by Health Statistics Division.

With regard to the preliminary² estimates, the number of births by sex is derived by applying an average proportion by sex for each province and territory to the births derived from the birth probabilities. These proportions are calculated using vital statistics from the past 10 years.

With regard to the preliminary² estimates, the number of deaths by age and sex is derived by applying mortality rates by age and sex for each province and territory to the deaths derived from the death probabilities. These mortality rates are calculated using vital statistics from the past 2 years.

Levels of estimates

For information on the differences between preliminary² and final estimates, see sections **B. Births and Deaths**, above.

C. Immigration

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, immigration is regulated by the Immigration and Refugee Protection Act (IRPA) of 2002. This statute superseded the Immigration Act, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes immigrants' administrative files. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. The information is used to estimate the number and characteristics of people granted permanent resident status by the federal government on a given date. For Demography Division, the terms immigrant and permanent resident are equivalent.

An immigrant is a person who is not a Canadian citizen by birth, but has been granted the right to live in Canada permanently by Canadian immigration authorities. The number of immigrants does not include persons born abroad to Canadian parents who are only temporarily outside the country.

Immigrants are usually counted on or after the date on which they are granted permanent resident status or the right to live in Canada.

The number of immigrants by age and sex is derived from the Field Operational Support System (FOSS).

Levels of estimates

The difference between preliminary² and final postcensal estimates lies in the timeliness of the source used to estimate this component. Since the FOSS files are continually being updated, new calculations are carried out each year to update the immigration estimates. Immigration estimates are preliminary the first year and final the following year.

D. Net non-permanent residents

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, the non-permanent residents (NPR) are regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes the administrative files of immigrants and NPRs in Canada. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. The information is used to estimate the number and characteristics of people granted non-permanent resident status by the federal government.

NPRs are persons who are lawfully in Canada on a temporary basis under the authority of a temporary resident permit, along with members of their family living with them. NPRs include foreign workers, foreign students, the humanitarian population and other temporary residents. The humanitarian population includes refugee claimants and temporary residents who are allowed to remain in Canada on humanitarian grounds and are not categorized as either foreign workers or foreign students. For Demography Division, the terms non-permanent resident and temporary resident are equivalent.

NPR estimates are based on the number of NPRs, not on the net. The number of people in CIC's administrative system is estimated on a specific date in each period of observation. First, the end-of-period number of NPR is estimated, and then the start-of-period number of NPR is subtracted from that estimate. That yields the net number of NPR.

Anyone who received non-permanent resident status prior to the observation date is counted. For refugee claimants, the date of their application is used. Permit holders and refugee claimants are excluded from the population if their permit has expired, if they receive permanent resident status, or if they are deported. In addition, refugee claimants are excluded if their file has been inactive for two years.

Since FOSS files are continually being updated, the figures are recalculated each year until the estimates of net NPR are final.

The net number of non-permanent residents by age and sex is derived from the Field Operational Support System (FOSS).

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the source used to estimate this component. Since the FOSS files are continually being updated, the figures are recalculated each year to update the estimates of the net number of NPRs. Non-permanent resident (NPR) estimates are preliminary the first year and updated the following year. They become final two to three years after the reference year, when all other components are also final.

E. Emigration

The number of emigrants is estimated using data from the Office of Immigration Statistics, U.S. Department of Homeland Security, data collected by the Canada child tax benefit (CCTB) program, and data from the T1 Family File (T1FF).⁵ The first source is used to estimate emigration to the United States. CCTB data are used to estimate emigration to other countries. The estimates of the number of child emigrants have to be adjusted because the CCTB is not universal and does not provide direct information on the number of adult emigrants. As a result, four adjustment factors are taken into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of emigrant children based on two versions of the CCTB files;
- the program's partial coverage, that is, people who do not apply for the CCTB or who are not eligible. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FF;⁵
- the differential propensity to emigrate between adults and children. This factor generates the emigration rate for the population aged 18 and over. It is obtained by (1) calculating the average ratio over three years of the adult and child emigration rates based on T1FF⁵ data, (2) calculating the average ratio over three years of the adult and child emigration rates based on data from the Office of Immigration Statistics, U.S. Department of Homeland Security, and (3) taking the average of the two rates. This factor is calculated for Canada only.

The adult emigration rate is applied to the adult population. Adult emigration is distributed by province and territory using data from the T1FF⁵ file. We calculate a ratio of the number of emigrant adults to the number of emigrant children from the T1FF⁵ file. We then apply this ratio to the number of emigrant children from the CCTB by province, which yields the number of adult emigrants whose provincial distribution will differ from that of the children.

The number of adult emigrants combined with the number of child emigrants (once adjusted for the coverage and differential emigration factors) generate the number of emigrants for the entire population.

Emigration is disaggregated by province and territory based on the number of child emigrants adjusted for coverage and differential emigration.

Estimates of the number of emigrants by age and sex are obtained by using the data by five-year age group, sex, province and territory from T1FF⁵ files adjusted for the coverage. We distribute these estimates by single year of age using Sprague coefficients.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

5. The T1 family file (T1FF) is derived from the Canada Revenue Agency (CRA) T1 file by Income Statistics Division of Statistics Canada.

F. Net temporary emigration

Some people leave Canada to live temporarily in another country while others who were temporarily outside of Canada return. The net result of those departures and returns is the component known as “net temporary emigration”. Estimates of the number of departures are derived from the Reverse Record Check (RRC), the most important census coverage study. The RRC provides an estimate of the number of people who left Canada temporarily during an intercensal period and are still out of the country at the end of the period. Estimates of the number of returns are based on two sources: the census and Demography Division’s estimates of returning emigrants. The census provides the number of people who were outside Canada at the time of the previous census and returned during the intercensal period. That number includes all returning emigrants. Then Demography Division’s estimate of the returning emigrants component is subtracted to produce the number of returning temporary emigrants. The estimated numbers of departures (RRC) and returns (census and Demography Division) yield an estimate of net temporary emigration.

This estimate is for the whole intercensal period; it is disaggregated into estimates for each of the five years in the period and then into monthly estimates using a seasonal adjustment that is an average between zero seasonality and the seasonality of emigration.

Net temporary emigration is calculated first for the national level. It is then disaggregated by province or group of provinces based on RRC estimates of temporary emigration. For the Atlantic provinces and the territories, the estimate for the group is disaggregated on the basis of each province / territory’s proportion of the group’s total population.

Net temporary emigration can be estimated only for the intercensal period preceding the most recent census. Net temporary emigration in the current period is assumed to be the same as in the previous period for each province and territory.

The emigration age and sex distribution is applied to obtain the age and sex structure of the net temporary emigration.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the emigration estimate used to calculate the seasonal adjustment for the net temporary emigration. The same estimation method is used.

G. Returning emigrants

A returning emigrant is a person who returns to Canada after having been classified as an emigrant. In a manner similar to the procedure used to calculate the number of emigrants, data from the Canada child tax benefit (CCTB) file from Canada Revenue Agency (CRA) and T1FF⁵ file are used to estimate the number of returning emigrants. Adjustment factors are applied to compensate for the fact that the CCTB program is not universal, and an adult/child ratio is used to estimate the number of adult returning emigrants. As a result, four adjustment factors are used to take into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of returning emigrant children based on two versions of the CCTB files;
- the program’s partial coverage, that is, people who do not apply for the CCTB or who are not eligible. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;

- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FFs;⁵
- the adult / child ratio, which is based on the census by age and sex (From 2006/2007, we are using distribution by age and sex derived from 2006 Census. The 2011 ratio will be available only after the release of the estimates by age and sex based on the 2011 Census).

The age and sex distribution of returning emigrants is based on the National Household Survey (NHS) data. Characteristics of returning emigrants are derived from the question on the place of residence one year ago, after excluding non-permanent residents and immigrants.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

H. Interprovincial migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As is the case for emigration, there is no provision for recording interprovincial migration in Canada. Consequently, such movements have to be estimated using data from the Canada child tax benefit (CCTB) of Canada Revenue Agency (CRA) and T1FF.⁵

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of tax filers' dependants has to be imputed. An adjustment is also required to take into account migrants who do not file income tax returns. From 2001/2002 to 2005/2006, the adjustment was slightly modified (for further information, see *Wilkinson, 2004*). From 2006/2007, this adjustment has been slightly modified (Cyr, 2008 – Internal document).

Since income tax returns are not available at the time preliminary estimates are produced, the estimation of preliminary² interprovincial migration is based on CCTB administrative files, which provide counts of child migrants (aged 0 to 17) receiving benefits under the program. The estimates have to be adjusted later for children who are not receiving the CCTB. Finally, the number of adult migrants is calculated using the number of child migrants and factors derived from the T1FF.⁵ As a result, three adjustment factors are used to take into account:

- the program's partial coverage, that is, people who do not apply for CCTB or who are not receiving benefits. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to migrate between children who are receiving the CCTB and children who are not. This factor is obtained by comparing the out-migration rates of children receiving the CCTB with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last available year of T1FF;⁵
- the differential propensity to migrate between adults and children. This factor generates the out-migration rate of the population aged 18 and over for each province / territory of origin and destination. It is obtained by calculating the ratio of the central migration rate for adults to the rate for children. It is estimated using data from the last three available years of T1FF.⁵

The adult migration rate is then applied to the estimated adult population. The number of adult migrants is then added to the number of child migrants to produce the number of interprovincial migrants for the entire population.

Interprovincial migration by age and sex is derived from T1FF⁵ data and counts derived from the NHS question on the place of residence one year ago. From 2011/2012, the 2011 NHS age and sex distribution is used.

Levels of estimates

For information on the differences between preliminary² and final estimates of total interprovincial migration, see section **H. Interprovincial migration** above.

Intercensal population estimates

Intercensal estimates – population estimates for reference dates between two censuses – are produced following each census. They reconcile previous postcensal estimates with the new census counts.

There are two main steps in the production of intercensal estimates:

- calculation of the error of closure;
- linear distribution of the error of closure.

The error of closure is defined as the difference between the postcensal population estimates on Census Day and the population enumerated in that census adjusted for CNU.¹

The error of closure is spread uniformly over the intercensal period of days within each month.

Intercensal estimates by age and sex are adjusted in the same way, i.e., by distributing the error of closure uniformly across the age-sex cohorts.

Quality of demographic data

The estimates contain certain inaccuracies stemming from two types of errors:

- errors in the census data;
- imperfections in other data sources and the method used to estimate the components.

Census data

A. Coverage, response and imputation errors

The errors attributable to census data can be divided into two groups: response and processing errors, and coverage errors. The first group implies non-response error, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of errors are intrinsic to any survey data.

The coverage errors occur when dwellings and/or individuals are missed, incorrectly included (except for the 2006 and 2011 censuses, where people incorrectly included were not considered in the Census Overcoverage Study) or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main studies are the Reverse Record Check Survey (RRC) and the Census Overcoverage Study (COS). Based on these studies, estimates of census net undercoverage (CNU) (which is equal to the difference between undercoverage and overcoverage) are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

When creating base populations, the Estimates Program corrects the census populations only for coverage errors. This correction, which is based on the findings of coverage studies, is primarily subject to sampling errors, and to a lesser extent, processing errors. Statistical tests indicate that coverage adjustments improve the quality of census data. The Estimates Program uses the estimates from coverage studies for the provinces and territories. However, given the size of the samples in these studies, estimates by age and sex are modelled. Furthermore, it is assumed that the coverage rates estimated for a province or territory apply to the regions within that geographic area. Prior to 1991, the Estimates Program used census data that was unadjusted for coverage errors. Coverage studies had been done to measure undercoverage, but none measured overcoverage. Following the decision to integrate a correction for the coverage to the enumerated population in 1991, the Program had to revise the population estimates for the period from 1971 to 1986. The correction is based on the findings of the coverage studies conducted during this period and on hypotheses regarding the ratio between the overcoverage and undercoverage levels based on the findings of subsequent coverage studies.

The corrections to the census data due to CNU improved, in general, the quality of the estimates by compensating for the differential undercoverage by age, sex and by province/territory across censuses.

Text table 1

Estimated census net undercoverage, Canada, provinces and territories, 2001, 2006 and 2011 Censuses

Geography	Census population	Census net undercoverage	Incompletely enumerated Indian reserves	Adjusted population	Rate
	A	B	C	D=A+B+C	(B+C)/D*100

Nunavut	26,745	1,256	0	28,001	4.49

1. The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors.

These adjustments have a direct impact on:

- the error of closure and its distribution by age and sex within a province or a territory as well as by province/territory as the CNU¹ and its distribution vary from one census to another;
- within-cohort consistency of population estimates. If for example, the male cohort in age group 0 to 4 in 1981 was tracked up to the 2001 Census (unadjusted for CNU)¹ the age group 20 to 24 would be noticeably smaller in 2001 than the age group 15 to 19 in 1996. Since Canada receives many immigrants within these age groups, the opposite would be expected. However, only after adjustment for CNU,¹ the cohort size increases from 1996 to 2001.

Text table 2

Census adjustment rates by age group, 2001, 2006 and 2011 censuses, Canada

	2001	2006	2011
All ages	3.10	2.79	2.32
0 to 4 years	3.59	2.25	0.94
5 to 9 years	2.20	0.97	-0.23
10 to 14 years	1.09	0.96	0.11
15 to 19 years	2.95	3.15	2.93
20 to 24 years	7.11	7.57	6.79
25 to 29 years	8.28	8.89	8.28
30 to 34 years	6.40	6.84	6.72
35 to 39 years	4.64	4.96	4.15
40 to 44 years	2.72	4.15	2.54
45 to 49 years	1.52	1.74	1.93
50 to 54 years	1.35	0.67	1.01
55 to 59 years	1.17	0.01	0.05
60 to 64 years	0.71	-0.07	-0.25
65 to 69 years	0.78	-0.46	-0.38
70 to 74 years	0.86	-0.72	-0.49
75 to 79 years	0.48	-0.48	-0.51
80 to 84 years	0.54	-0.70	-0.51
85 to 89 years	-1.52	-0.33	-0.49
90 to 94 years	-5.45	-11.54	-0.47
95 to 99 years	-0.08	-6.64	-9.44
100 years and over	-9.58	-7.37	-11.85

Note(s): The census adjustment represents the sum of census net undercoverage, incompletely enumerated Indian reserves and demographic adjustment.

For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: *1996, 2001, 2006 and 2011 Census Technical Report on Coverage*.

Components

Errors due to estimation methodologies and data sources other than the census can also be significant.

A. Births and deaths

Since the law requires the recording of vital statistics, the final estimates for births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

B. Immigration and non-permanent residents

With respect to immigrants and non-permanent residents, Citizenship and Immigration Canada (CIC) administers special data files on both of these components. Since immigration is controlled by law, data on immigrants and NPRs are compiled upon arrival in Canada. These data represent only “legal” immigration and exclude illegal immigrants. Thus, for the “legal” part of international movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the Visitor Data System (VDS) from (CIC) is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of NPRs are more prone to error than data on immigrants.

C. Emigration, returning emigration and net temporary emigration

Of all the demographic components that are used in the population estimates program, the emigration, returning emigration and net temporary emigration are the most difficult to estimate with precision. Canada does not have a complete border registration system. While immigration and non-permanent residents (NPRs) are well documented by the federal government, Statistics Canada has always used indirect techniques for the estimation of the number of persons leaving the country. For this reason, available statistics regarding these three components have historically been of a lower quality than other components.

Estimates of the number of emigrants and returning emigrants are both derived using Canada child tax benefit (CCTB) data provided by Canada Revenue Agency (CRA). Estimates must be adjusted to take into account the incomplete coverage of the program and to derive the emigration and returning emigration of adults.

These adjustments and the delay in obtaining the data are the two main sources of errors. As current information on the number of persons living temporarily abroad does not exist, estimates are based on the Reverse Record Check (RRC) and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Moreover, assumptions were made to allow for the distribution of annual estimates to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

D. Interprovincial migration

Since July 1993, preliminary² interprovincial migration estimates have been based on Canada child tax benefit (CCTB) files. Under this program, only 76% of children aged 0 to 17 at the Canada level were entitled to benefits on July 1, 2001. Consequently, preliminary CCTB based estimates are subject to larger error than final estimates derived from Canada Revenue Agency (CRA) tax files.

E. Level of detail of components

As a more detailed breakdown of the data introduces a greater risk of inaccuracy into the estimates, the possibility of error in the components is augmented by the method used to distribute the estimates by age and sex. It seems that, in general, the initial errors should be minimal where the distribution of annual estimates of births, deaths and immigrants is concerned, and more significant with regard to the distribution of other components (non-permanent residents, emigrants, returning emigrants, net temporary emigrants and interprovincial migrants). Finally, the size of error due to the age and /sex distribution may vary by period and errors in some components may have a greater impact on a given age group or sex.

Quality assessment

In order to assess the quality of our estimates, two evaluation measures are used: precocity errors and errors of closure.

A. Precocity error

The quality of preliminary estimates of components is evaluated using precocity errors. Precocity error is defined as the difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates. The precocity error measures the impact of the trade-off of accuracy in favour of timeliness on the estimated population. The precocity error is calculated as:

Figure 8

Precocity error

$$PE_{(t-1,t)} = \frac{(N_{(t-1,t)}^{preliminary} - N_{(t-1,t)}^{final})}{P_{t-1}} \times 1,000$$

where,

$PE_{(t-1,t)}$ = the precocity error for the period from t-1 to t;

$N_{(t-1,t)}^{preliminary}$ = the preliminary estimate of a component of demographic change;

$N_{(t-1,t)}^{final}$ = the final estimate of a component of demographic change;

P_{t-1} = estimated population for the relevant geographical area at time t-1.

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Precocity error can either be positive or negative. A positive precocity error denotes that the preliminary estimate is larger than the final estimate while a negative precocity error indicates the opposite.

Precocity error by component for Canada

At the national level, immigration component yielded the smallest precocity errors,¹ with values close to zero per thousand throughout the years under consideration. On the other hand, interprovincial in-migrants and out-migrants² yielded the greatest precocity errors, ranging between 0.92 per thousand and 2.24 per thousand during the period 2009/2010 and 2012/2013 (see text table 3).

1. As precocity errors can either be positive or negative, the following discussion of precocity errors is based on absolute values.

2. At the national level, net interprovincial migration equals to zero as the sum of interprovincial in-migrants is equivalent to the sum of interprovincial out-migrants across provinces and territories.

Precocity errors for births were mostly small when compared to other components, with the largest precocity error of -0.29 per thousand in 2007/2008. Similar to births, precocity errors for deaths were also low, with values less than 0.32 per thousand in current years.

Precocity errors for emigration and returning emigration were mostly negative, i.e. preliminary estimates were smaller than final estimates. During the years under consideration, precocity error for emigration was lowest in 2009/2010 at 0.05 per thousand and largest in 2007/2008 at -0.48 per thousand. For returning emigration, the values ranged from -0.20 per thousand in 2008/2009 to -0.33 per thousand in 2007/2008 and 2010/2011. During the period 2007/2008 to 2010/2011, the precocity errors for net temporary emigration were positive and low, at 0.05 per thousand throughout those years.

Precocity errors for net non-permanent residents were negative and low during the period under consideration. From 2007/2008 to 2009/2010, precocity errors were stable at -0.04 per thousand and increased slightly to -0.08 per thousand in 2010/2011.

Precocity error by component for provinces and territories

In general, precocity error is typically larger for smaller provinces or territories as it is an error measurement relative to population size. At the provincial level, precocity errors larger than ± 10.0 per thousand occurred only once for Prince Edward Island during the current four years under consideration. However, this occurred many times for the three territories (refer to text table 3).

At the provincial and territorial level, precocity errors for births were small and mostly negative, ranging from close to zero per thousand (Quebec in 2009/2010)³ to -1.67 per thousand (Nunavut in 2009/2010). Similar to births, precocity errors for deaths were also low but predominantly positive. Over the years, the largest precocity error for deaths was 1.03 per thousand (Northwest Territories in 2010/2011).

Compared to other demographic components, precocity errors for immigration were low among the provinces and territories, with absolute error values no more than 0.21 per thousand over the current years. Net non-permanent residents was another component that yielded small precocity errors, with absolute error values less than 0.42 per thousand across the provinces and territories.

Precocity errors for emigration ranged from the lowest at 0.01 per thousand (Saskatchewan in 2007/2008) and -0.01 per thousand (New Brunswick in 2009/2010) to the largest at -1.56 per thousand (Northwest Territories in 2007/2008). Precocity errors for returning emigration were mostly negative; the values ranged from around zero per thousand for some years in the three territories to -0.74 per thousand for Yukon in 2009/2010. Precocity errors for net temporary emigration were positive during the years under consideration, except for British Columbia (2007/2008 to 2010/2011) and the Northwest Territories (2008/2009 to 2010/2011 only).

Precocity errors for interprovincial in-migrants and out-migrants show that final estimates of these components were systematically lower than preliminary estimates (with three exceptions for in-migrants and one exception for out-migrants).

At the provincial level, the largest precocity error for net interprovincial migration was -6.63 per thousand (Prince Edward Island in 2009/2010), while the smallest was close to zero per thousand (Quebec in 2009/2010). Compared to the other provinces, precocity errors for Ontario and Quebec were relatively low during the years under consideration, with the largest error for these two provinces at -0.55 per thousand for Ontario in 2012/2013. Precocity errors for net interprovincial migration for Alberta, the gainer in net interprovincial migration in recent years, ranged from a low of 0.14 per thousand in 2011/2012 to a high of 3.62 per thousand in 2012/2013.

Contribution of components to the sum of precocity errors

When looking at aggregated estimates of precocity errors, there is the potential for a “netting-out” effect, referring to negative precocity errors in one component canceling out positive errors in another component. The analysis of the contribution of each component to the sum of precocity errors without the netting-out effect can be done by using absolute values of the precocity errors. A mean absolute percentage precocity error by component is calculated by dividing the mean absolute precocity error by component by its sum and expressed in percentages. In this case, the mean absolute precocity error by component is the mean of the absolute precocity errors for the 2006/2007 to 2010/2011 period.

At the national level, the mean absolute precocity error for the total emigration⁴ component contributed the most to the sum of mean absolute precocity errors (62.37%), followed by births (15.22%) and deaths (13.89%), between 2006/2007 and 2010/2011. Immigration and net non-permanent residents each accounted for less than 9.0% to the sum of mean absolute precocity errors (refer to text table 4).

3. As mentioned in the Methodology Section, the provincial statistical agencies of Quebec and British Columbia provide their most recent estimates of births and deaths to Statistics Canada. The figures are used to produce preliminary estimates.

4. Mean absolute percentage precocity error for total emigration includes the mean absolute percentages for emigration, returning emigration and net temporary emigration.

Manitoba	14.33	11.20	2.10	29.81	3.07	39.50	100.00
Saskatchewan	12.96	6.45	1.28	15.04	0.89	63.38	100.00
Alberta	12.86	5.44	2.18	22.55	4.55	52.42	100.00
British Columbia	1.15	1.75	1.22	66.54	0.79	28.55	100.00
Yukon	6.63	5.03	1.10	8.22	3.10	75.91	100.00
Northwest Territories	6.45	3.86	0.53	13.23	2.18	73.75	100.00
Nunavut	8.53	3.52	0.41	6.96	1.16	79.43	100.00

1. Total emigration includes emigration, returning emigration and net temporary emigration.

At the provincial and territorial level, the contribution of individual component to the sum of mean absolute precocity errors was not uniform across the country. Net interprovincial migration accounted for the largest share of the sum of mean absolute precocity errors in ten out of the thirteen provinces and territories, ranging from 35.30% in New Brunswick to 79.43% in Nunavut. In Quebec, Ontario and British Columbia, total emigration contributed the most to the sum, with 56.59%, 47.96% and 66.54%, respectively (refer to text table 4).

On the other hand, births accounted for the smallest share of the sum of mean absolute precocity errors in Quebec, at 1.92%. Between 2006/2007 and 2010/2011, net non-permanent residents accounted for the smallest share of the sum of mean absolute precocity errors in Newfoundland and Labrador (1.02%), Prince Edward Island (1.63%), New Brunswick (0.42%), Saskatchewan (0.89%) and British Columbia (0.79%). For the rest of the provinces and territories, the contribution of immigration to the sum was the smallest, at 2.18% or below.

Precocity errors by age and sex are not currently available.

B. Error of closure

The error of closure measures the exactness of the final postcensal estimates. It is defined as the difference between the final postcensal population estimates on Census Day and the enumerated population of the most recent census adjusted for census net undercoverage (CNU¹). A positive error of closure means that the postcensal population estimates have overestimated the population.

The error of closure comes from two sources: errors primarily due to sampling when measuring census coverage and errors related to the components of population growth over the intercensal period. For each five-year intercensal period, the error of closure can only be calculated following the release of census data and estimates of CNU¹. The error of closure can be calculated for the total population of each province and territory as well as by age and sex.

Text table 5 shows postcensal population estimates on May 10, 2011 and census counts adjusted for CNU¹ and the errors of closure for Canada, provinces and territories for 2001, 2006 and 2011.

For Canada as a whole, the error of closure was estimated at 171,115 or 0.50% in 2011. This is an increase over the errors for 2001 (0.16%) and 2006 (0.14%).

The population estimates overestimated the population of six provinces, two territories and Canada as a whole. Four provinces and two territories posted errors of closure greater than 1% or less than -1%. Of these jurisdictions, only Newfoundland and Labrador's estimated population differed from the adjusted census population by more than 2% (-2.09%). In 2006, two provinces and three territories posted errors of closure greater than 1% or less than -1%, while this was the case for three provinces and two territories in 2001.

By considering the variance in CNU, it is possible to identify errors of closure that are statistically significant. Text table 5 shows the results of this analysis.

The error of closure is statistically significant for Canada, five provinces and one territory. This means that the population estimates significantly overestimated or underestimated the adjusted census population in these jurisdictions. As noted above, these results are due to both the sampling for census coverage studies and errors in the components of population growth over the intercensal period. Among these components, interprovincial migration and emigration are mostly associated with large errors of closure.

Text table 5

Error of closure of the population estimates, Canada, provinces and territories, 2001, 2006 and 2011

Geography	Postcensal estimate on Census Day	Census ¹ adjusted for CNU	Error of closure		CNU ² standard error	t ³ value
	A	B	C=A-B	D=C/B*100	E	F=C/E

Northwest Territories	41,152	40,655	497	1.22	362	1.37
Nunavut	28,051	28,001	50	0.18	411	0.12

1. Census net undercoverage includes the incompletely enumerated Indian reserves.

2. Census net undercoverage excludes the incompletely enumerated Indian reserves.

3. An error of closure with a t value greater than 1.96 or less than -1.96 is statistically significant at the 95% confidence level.

The error of closure can be calculated for total population estimates and for age and sex.

Text table 6

Error of closure of the estimates of population by age and sex, 2011, Canada

	Both sexes		Male		Female	
	number	percent	number	percent	number	percent

Appendix A

Glossary

Age

Age as of July 1.

Ageing (of a population)

An increase in the **number of old persons** as a percentage of the total population.

Average age

The average age of a population is the average age of all its members.

Census coverage

Census net undercoverage: Difference between undercoverage and overcoverage.

Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to be enumerated in a census but were not.

Cohort

Represents a group of persons who have experienced a specific demographic event during a given year. Thus, the married cohort of 2001 consists of the number of persons who got married in 2001. In the cast of births, persons born within a specified year are referred to as a generation.

Components of demographic growth

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter either the total population or the age and sex of the population.

Dependency ratio

The **ratio of the combined population** aged from **0 to 14 years old** and the population **aged 65 years** and over to the population aged from **15 to 64 years old**.

Emigrant

Canadian citizen or **immigrant** who has left Canada to establish a permanent residence in another country.

Error of closure

Difference between the **postcensal estimate** at the census date and the results of the census adjusted for **census net undercoverage** (including adjustment for incompletely enumerated Indian reserves).

Generation

Unless otherwise specified, refers here to a group of persons born within a given period. The 2001 generation represents people born during the year 2001.

Immigrant

Within the framework of this publication, the term immigrant refers to **landed immigrant**. An immigrant is a person who does not have Canadian citizenship but was granted the right by the immigration authorities to live in Canada on a permanent basis.

International migration

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to **immigrants, emigrants, returning emigrants, net temporary emigrants** and **net non-permanent residents**.

Interprovincial migration

Interprovincial migration represents movement between provinces or territories involving a change in the usual place of residence. A person who takes up residence in another province or territory is an **out-migrant** with reference to the province or territory of origin and an **in-migrant** with reference to the province or territory of destination.

Median age

The median age is an age "x", such that exactly one half of the population is older than "x" and the other half is younger than "x".

Natural increase

Variation in the population size over a given period as a result of the difference between the numbers of births and deaths.

Net international migration

Net international migration is obtained according to the following formula: **Immigrants + returning emigrants + net non-permanent residents - (emigrants + net temporary emigrants)**.

Net interprovincial migration

Net interprovincial migration represents the difference between **in-migrants** and **out-migrants** for a given province or territory.

Net non-permanent residents

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

Non-permanent residents

A non-permanent resident belongs to one of the five following groups:

- persons with a usual place of residence in Canada who are claiming refugee status;

- persons with a usual place of residence in Canada who hold a Study Permit;
- persons with a usual place of residence in Canada who hold a Work Permit;
- persons with a usual place of residence in Canada who hold Minister's permits (including extensions);
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work permits or minister's permits and living in Canada.

Net temporary emigrant

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and **immigrants** living temporarily abroad who have not maintained a usual place of residence in Canada.

Population

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is within that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered **non-permanent residents**.

Population estimate

- Postcensal:** Population estimate produced by using data from the most recent available census adjusted for **censusnet undercoverage** (including adjustment for incompletely enumerated Indian reserves) and estimate of the **components of demographic growth** since that last census. This estimate can be preliminary, updated or final.
- Intercensal:** Population estimate derived by using **postcensal estimates** and data adjusted for **censusnet undercoverage** (including adjustment for incompletely enumerated Indian reserves) of censuses preceding and following the year in question.

Population growth or total growth

Variation of population size between two dates. It can also be obtained by summing the **natural increase**, **total net migration** and if applicable, subtract **residual deviation**. It can be positive or negative.

Precocity error

Difference between preliminary and final estimate in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for either population estimates or components of population growth.

Rate

Refers to the ratio of the number of events estimated in a year ($t, t+1$) to the average populations at the beginning and the end of the period. In this regard, births, deaths, immigration rates, etc are calculated. Generally, the rates are expressed in per 1,000.

Demographic growth rate or population growth rate: Ratio of population growth between the year t and $t+1$, to the average **population** of both these years. The rate is generally expressed in per 1,000.

Overcoverage of population rate: The ratio of the number of persons who should not have been counted in the census or who were counted more than once to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Undercoverage of population rate: The ratio of the estimated number of persons not enumerated in the census (who were intended to have been enumerated) to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Census net undercoverage of population rate: The difference between the census undercoverage rate and the census overcoverage rate.

Residual deviation

Difference between demographic **population growth** calculated using **intercensal estimates** of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution (based on the number of days) of the **error of closure** between years within the quinquennial period.

Returning emigrant

Canadian citizen or **immigrant** having previously emigrated from Canada and subsequently returned to the country.

Sex ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live-born boys to the number of live-born girls. This ratio is usually expressed as an index, with the number of females taken to be a base of 100.

Sprague coefficients

Series of factors which, when multiplied to a population distributed by multiples age groups, give a distribution of the same population by single years of age.

Total net migration

Sum of **net international** and **net interprovincial** migration.

Vital events

Includes all the demographic events (births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

Year

Unless otherwise specified, the term "year" refers to the period beginning July 1 of a given year and ending June 30 of the following year.

Appendix B

Sources and remarks

Base population

May 10, 2011 Census of Population adjusted for census net undercoverage and incompletely enumerated Indian reserves.

2011 Census: Statistics Canada, Census of Canada, 2011, Catalogue no. 98-310-X.

Census net undercoverage: See The Daily, September 26, 2013.

Incompletely enumerated Indian reserves: See The Daily, September 26, 2013.

Births and deaths

Statistics Canada, Health Statistics Division.

Statistics Canada, Demography Division, catalogue no. 91-215-X, annual.

Births: Fertility rates for 2011 based on births by age of mother provided by Health Statistics Division applied to the female population estimates at the beginning of the quarter. Births for Quebec and British Columbia were provided by their respective agencies.

Deaths: Mortality rates for 2011 based on deaths by age group and sex provided by Health Statistics Division applied to the population estimates by age group and sex at the beginning of the quarter. Deaths for Quebec and British Columbia were provided by their respective agencies.

Immigration

Estimates are based on the immigrant files provided by Citizenship and Immigration Canada (CIC) according to information made available on August 18, 2014.

Emigration

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB) program. From 2012/2013, we used 2011/2012 data;
- tax data calculated using T1FF file provided by the Income Statistics Division of Statistics Canada. From 2012/2013, we used 2011/2012 data;
- data provided by the U.S. Department of Homeland Security, Office of Immigration Statistics. From 2013/2014, we used 2012/2013 data;
- data on the number of adult and children emigrants from T1FF5 file used for the provincial distribution of adults. From 2012/2013, we used 2011/2012 data.

Returning emigration

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB) program. From 2012/2013, we used 2011/2012 data;
- 2011 National Household Survey – question on the place of residence one year ago.

Net temporary emigration

The estimates are produced by Demography Division using:

- data from the Reverse Record Check (RRC) of the 2011 Census;
- 2011 National Household Survey – question on the place of residence 5 years ago;
- estimates of returning emigrants for 2006 to 2011 intercensal period.

Non-permanent residents

The estimates are produced by Demography Division using Field Operational Support System files (FOSS) from CIC. These files, received on August 18, 2014, document the number of persons holding permits/authorizations or claiming refugee status.

Note: Over the last several months, a progressive increase in the number of records with missing intended province/territory of residence was observed in the administrative files of CIC. These files are used by the Demography Division to produce estimates of the net change in the number of non-permanent residents (NPRs) by province and territory. According to usual processes, the Demography Division imputes missing cases on a prorated basis based on known cases. This process was done for all estimates up to those released on June 18, 2014.

CIC has recently developed an alternative way of allocating a province or territory of residence when this information is missing through the use of other sources of information. These new data were produced for the period beginning on January 1, 2013. They considerably reduced the quantity of imputation needed.

Estimates released on September 26, 2014 take these changes into account. This explains the extent, higher than usual, of the update made to the estimates of net non-permanent residents beginning January 1, 2013.

Interprovincial migration

The estimates are produced by Demography Division using:

- CCTB-based adjusted migration data for children;
- factors corresponding to the ratio of the migration rate of all children to the migration rate of eligible children calculated using 2012/2013 tax file data;
- factors used to calculate adult migration and corresponding to the ratio of the adult to child migration rates, calculated on a three-year basis using tax file data for 2010/2011, 2011/2012 and 2012/2013.
