ECONOMICS DIVISION, MARKETING SERVICE
ANADA DEPARTMENT OF AGRICULTURE
OTTAWA, ONTARIO

ACKNOWLEDGEMENT

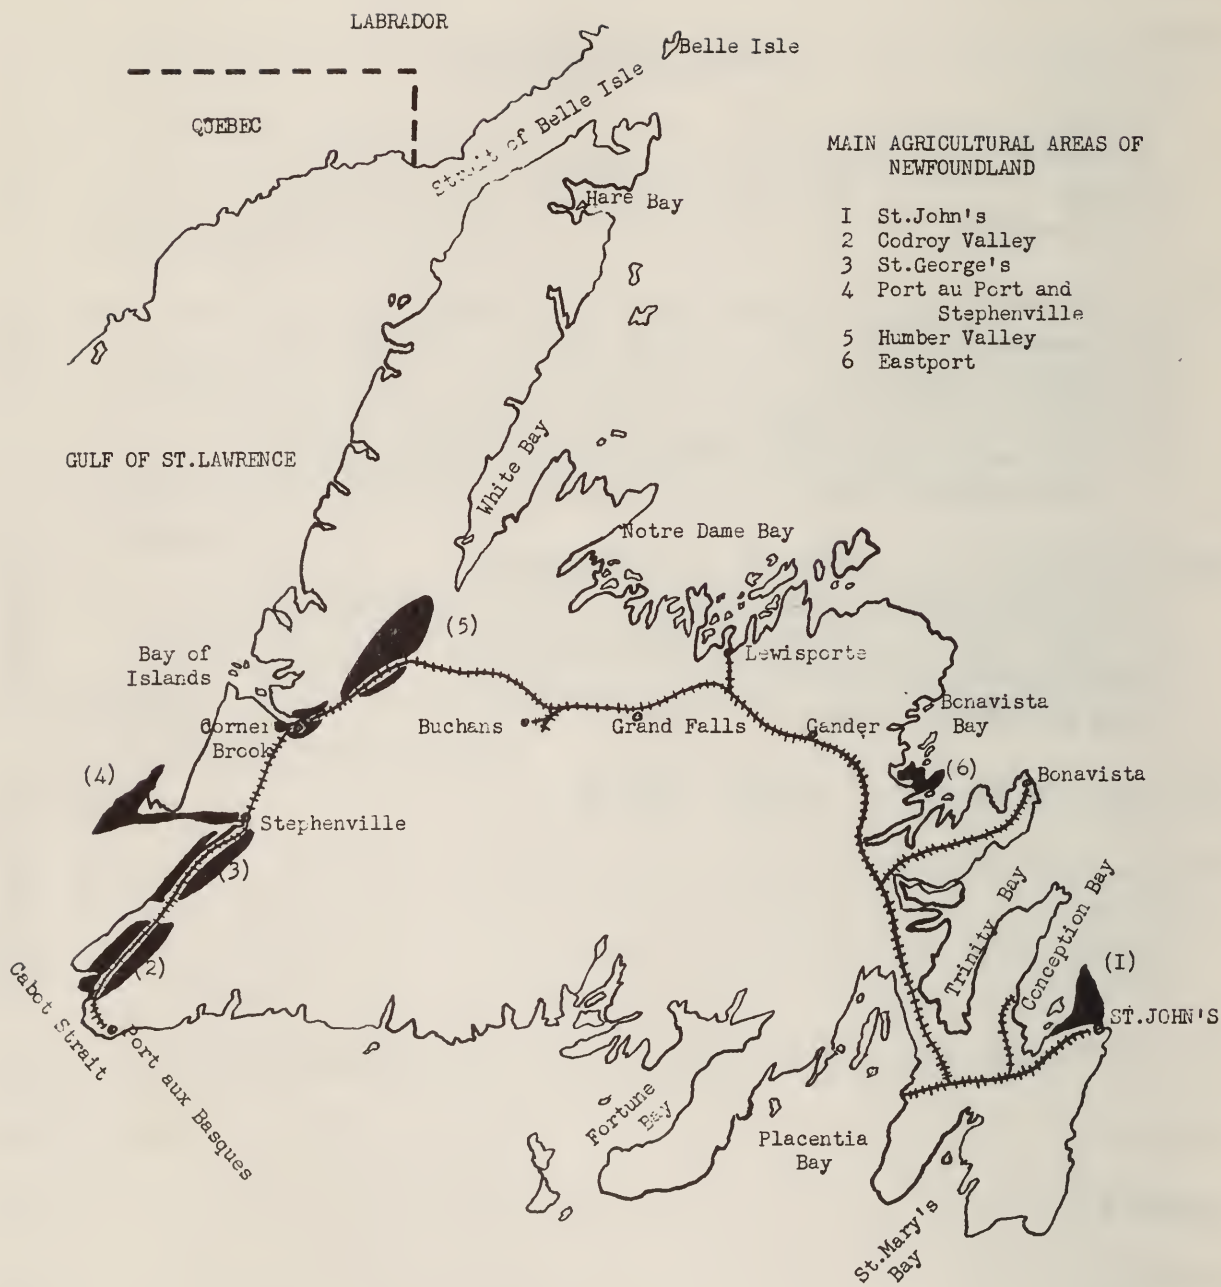

This study was conducted in co-operation with the Department of Natural Resources of Newfoundland. Members of the staff of that Department assisted in the field work and carried out certain office tabulations.

The basic information made available by the Canadian National Railways, the various shipping firms and airlines was essential. Necessary data were obtained in large measure through the co-operation of the Customs and Excise Division of the Federal Department of National Revenue. Local farmers, wholesalers and retailers contributed important details of their operations.

G. A. O'Brien, formerly of the Economics Division, Canada Department of Agriculture, Ottawa, was in charge of the field work and made a valuable contribution to the early analysis of the data. Senior members of the Economics Division gave essential direction throughout the study.

THE MARKET FOR FARM PRODUCTS IN NEWFOUNDLAND

1948 - 1950

INTRODUCTION AND PURPOSE

The development of agricultural production and marketing in Newfoundland is far from complete. Although factors such as climate and soil may preclude the establishment of a large-scale agricultural economy, an increase in production in order to supply a larger proportion of the home market demand appears quite possible. Farmers are being encouraged by the Provincial government to have the home-produced commodities constitute a larger share of the total market requirements. Accordingly, Newfoundland producers are directing their efforts towards greater production of the commodities that are well adapted to the Newfoundland conditions and that can compete successfully with the non-local items.

In addition to problems of production the agricultural industry in Newfoundland is faced with substantial problems in the field of marketing. Traditionally the Island has exported fish and primary products and imported food products. Through the years her people have looked to the sea and not to the soil for their livelihood. Such trading practices and habits do not favor a rapid transition to the production and sale of farm products. If agriculture is to prosper, progressive marketing methods and adequate facilities associated therewith will have to be established. The competition represented by products coming from the neighbouring Maritime Provinces, particularly Prince Edward Island, will have to be met.

In the spring of 1950 the Economics Division of the Canada Department of Agriculture, at the request of and in co-operation with the Department of Natural Resources of Newfoundland undertook a marketing study in Newfoundland. Specifically, the project was designed to determine the market for farm products in Newfoundland over the two-year period April 1, 1948 to March 31, 1950. This was the first study of its type undertaken there. The objectives of the study were:-

- (1) to determine the market for farm products in Newfoundland including specific analyses of the markets in the St. John's and Corner Brook market areas for the two-year period April 1, 1948 to March 31, 1950
- (2) to determine what proportion of the total market requirements for the two-year period ended March 31, 1950 was produced within Newfoundland itself and what proportion was supplied from other sources
- (3) to make a comparison between the market, together with sources of origin of farm products, as it existed during the twelve months immediately preceding Newfoundland's entry into Confederation and the twelve months immediately following Confederation.

Notwithstanding the limited overall productive capacity of Newfoundland agriculture, a more precise knowledge of the available markets, if used to advantage, should benefit both producers and distributors of farm products in Newfoundland. Since Newfoundland is a deficit area in the production of food and fibre, a comprehensive survey of the market requirements should be of value to producers, distributors, and transportation agencies in other parts of Canada.

It is known that Newfoundland brings in from outside a very large proportion of her requirements of farm products. If the quantities and prices of the various commodities brought in from outside sources can be determined more exactly and these can be compared with local marketings then some idea as to the market

potential available to the Newfoundland grower can be ascertained. Although the local farmer is hampered to some extent in his production by soil and climate conditions, his proximity to market should be of considerable advantage in supplying certain products.

SCOPE AND METHOD

Information as to the kind, amount, and value of a selected list of products of farm origin entering Newfoundland during the two-year period April 1, 1948 to March 31, 1950 was obtained. In addition, the shipping point and province of origin of the agricultural commodities produced on the Canadian mainland or Prince Edward Island and the country of origin of farm products imported from abroad were procured.

The import data for the year April 1, 1948 to March 31, 1949* were transcribed from the Newfoundland customs entries. For the year April 1, 1949 to March 31, 1950 the data were transcribed from four sources (1) the railway freight and express records (2) the cargo manifests kept by the various shipping lines (3) the air express bills and (4) the Canadian customs entries for receipts from foreign countries.

Details of the distribution and the methods of marketing farm products employed by the wholesalers, jobbers, importers, retailers and other handlers were obtained. Representative prices (laid-down cost to the Newfoundland wholesaler) of all farm products were secured as a means of checking transcribed values and also to apply in cases where values were not shown. Net weights and container weights were made available by the wholesale trade.

Detailed information from a sample of Newfoundland producers of farm products concerning the kind, amount, value, and quality of the products offered for sale during the two-year period ended March 31, 1950 and the methods of marketing such products within the province was collected.

NATURE OF THE AREA

Location. - The Island of Newfoundland, triangular in shape, is situated at the mouth of the Gulf of St. Lawrence. On the north the Strait of Belle Isle separates it from the coast of Labrador only 12 miles distant at the narrowest position; and on the southwest, Cabot Strait separates it from Cape Breton Island by some 98 miles. It has a total area of approximately 42,700 square miles, nearly half the size of the United Kingdom.

Newfoundland's rocky coastline is pierced with numerous coves and inlets and on the east coast particularly there are many large bays which provide sheltered harbors. The coastline is estimated to have a total length of about 6,000 miles.

The capital city of St. John's is situated on the east coast of the Avalon Peninsula. Built on a height of land overlooking its natural harbor, St. John's is an important port and is the main distribution and commercial centre. It is one of the oldest cities in North America.

On the west coast at the mouth of the Humber River, Newfoundland's second

*In order to simplify the writing of the periods under study the first will be referred to in the text as 1948-49 (covering April 1, 1948 to March 31, 1949) and the second as 1949-50 (April 1, 1949 to March 31, 1950.)

city, Corner Brook, is located. Corner Brook has sprung up largely in the past 25 years and is now regarded as the centre of the pulp and paper industry.

Population. - The population of Newfoundland (not including Labrador) was 353,526 according to the 1951 Census. Of this total, 154,795 were classed as urban dwellers and the remainder as rural. The metropolitan area of St. John's, with its 67,749 residents and the 10,276 persons living in Corner Brook, made up slightly over 50 per cent of the urban population. Approximately 42 per cent of the total population is located on the Avalon Peninsula, in the southeast corner of the province.

The 1951 Census of Agriculture indicated that there were 3,626 farms in Newfoundland but only 780 of these were classed as commercial.

Table 1. Population *

	Population	Percentage of Newfoundland population
Newfoundland (excluding Labrador)	353,526	
Rural	198,731	56.2
Urban	154,795	43.8
St. John's (metropolitan area)	67,749	
Corner Brook	10,276	
	78,025	22.1

* Dominion Bureau of Statistics, 1951 Census

Agriculture. - Up to the present time, agriculture in Newfoundland has not been important commercially. Much of the farming is of the subsistence type and is carried on in conjunction with the fishing industry. Newfoundlanders are by tradition fishermen and since the fishing and growing seasons coincide to a great extent, agricultural pursuits are limited. However, the production of vegetables, and to a lesser extent meat and dairy products, to help meet the needs of these people points up the real value of this type of farming.

Although good farming land is not abundant in Newfoundland there are areas that have productive soil. These are principally the Codroy and Humber Valleys on the west coast and the St. John's area on the Avalon Peninsula. It is mainly in these three regions that the full-time farmers have settled.

As a result of glacier action much of the total land area consists of stony

deposits and soil that originated from mineral and organic matter. A large portion of the soil is so stony that clearing is not worthwhile. The well-drained soils are generally low in fertility and require heavy applications of lime and phosphates. These conditions prevail in the Alder Muck type of soil. The Alluvial soils are the most fertile but they do not occur extensively.

Climate. - Newfoundland has a temperate, marine climate but is cooler than other coastal areas in the same latitude because of the cold Labrador current which sweeps along the east and west coasts. The summer season is short and inclined to be cool although brief warm spells do occur. The winter is long but is not usually severe and sub-zero temperatures are not common in the coastal areas.

At St. John's on the east coast the average daily temperature for February was 22°F. while in Corner Brook on the west coast it was 14°. Average August temperatures for St. John's and Corner Brook were 61°F. and 62°F., respectively.

The frost-free period in the St. John's area was 130 days on the average while that at Corner Brook averaged 107 days. Although the frost-free period on the Island compares favorably with that of many other parts of Canada, the lack of steady sunshine and the existence of lower night temperatures somewhat retard growth during the season.

Precipitation is abundant and is fairly evenly distributed throughout the year. Rainfall is heaviest during October when from 4 to 6 inches falls. From June to September the rainfall averages close to 3.7 inches per month. The month of February usually brings the heaviest snowfall.

Transportation. - The single track, narrow-gauge railway line which winds its way some 547 miles from St. John's on the east coast to Port aux Basques on the west coast is the most important transportation link within the Island. This railway system, which was formerly operated by the Newfoundland government, became a part of the Canadian National Railways after Newfoundland's entry into Confederation. The main line serves the important cities of Corner Brook on the west coast and Grand Falls and Gander in the interior. Port aux Basques is linked with North Sydney on Cape Breton Island by regular ferry service. In addition to the main line service, branch lines on the Avalon Peninsula connect the main centres with St. John's. Other branch lines join the northeast coast ports of Bonavista and Lewisporte with the main line.

Water transportation is naturally of great importance to the inhabitants and this importance is emphasized by the fact that a large proportion of the people live in coastal settlements. Steamship services operated by the railway provide regular calls at these "out-ports" and are timed to meet the needs of the people. Except on the south coast this steamer service is suspended in the winter months. Private schooners used in the fishing industry provide an invaluable service in carrying supplies to coastal towns. Steamship connections with ports in Canada, the United States, and Europe are supplied by various companies. Regular schedules are operated from St. John's to Halifax, Boston, New York, and Liverpool. When the St. Lawrence river is open to navigation, there is steamer service between Montreal and Corner Brook, and Montreal and St. John's.

As yet, road transportation has not developed to an adequate degree. Much of the population is located along the coast and conditions have not favored the construction of a highway system to link these communities. On the Avalon Peninsula, which is the most populated portion of the Island, much more attention has been given to road building. Although the paved highway portion is

limited and is confined to the St. John's area there are hundreds of miles of gravel surfaced roads joining the towns of the Peninsula. From the paper industry cities of Corner Brook on the west coast and Grand Falls in the interior good gravel roads extend out to the communities in their respective vicinities. There are many miles of local roads in and around the numerous small coastal communities. The road work which is at present in progress will link the existing routes on the Avalon Peninsula with those extending from Gander, Grand Falls, and Corner Brook to form a trans-island highway.

Newfoundland occupies an important position on the air route between North America and Europe. Aircraft representing numerous world airlines stop at the well-known Gander airport on the eastward and westward lap of their trans-Atlantic flights. In addition, Torbay airport near St. John's is the eastern terminus for Trans Canada Airlines domestic flights.

EXTENT OF THE MARKET

In the following presentation dealing with market requirements attention will be given first to the Newfoundland market. This will be followed by a discussion of the two main components of the total market, i.e. the St. John's market area and the Corner Brook market area.

1. Newfoundland Market

The Newfoundland market for purposes of this analysis was considered to be the Island as a whole and did not include the Labrador portion of the province. Agricultural commodities designated as "non-local" were those which were brought from other provinces or countries. Those commodities described as "local" were produced on the Island and sold through regular channels. Figures related thereto were based on information obtained from a sample of Newfoundland farmers. Their sales to wholesalers, retailers and householders over the two-year period commencing April 1, 1948 were obtained for this purpose.

Market Receipts. - The total value of all agricultural commodities sold through commercial channels in 1948-49 amounted to more than \$19.8 million (Table 2). For the following year (the first year after Newfoundland's entry into Confederation) this total rose to over \$22.4 million (Table 3).

On a dollar basis, meats were the most important commodity sold in both years under consideration as their total value amounted to almost \$8.7 million in 1948-49 and in 1949-50 this amount increased to \$10.5 million.

Dairy products were of considerable importance to the market over the two-year period. Although the total weight sold dropped from approximately 19 million pounds in 1948-49 to 17.8 million in 1949-50, slightly higher prices caused the total value to increase by a small amount to approach \$3,284,000. Canned milk was the most important single item in this group.

Large quantities of vegetables were sold over the two-year period. During the year beginning April 1, 1948 over 56 million pounds valued at close to \$2.2 million were marketed and in the next year more than 63.7 million pounds with a value exceeding \$2.1 million were marketed through regular channels.

Fruit was also an important component of the Newfoundland market. Although the 14.9 million pounds sold in 1949-50 represented a drop from the 16.8 million pounds marketed the previous year and the dollar value declined slightly from the 1948-49 level of nearly \$1.4 million, the amounts involved are substantial.

Feed and feed grains command an important position on the market. Slightly

over 35 million pounds were sold in 1949-50 and this represented an increase of approximately 6 million pounds over the previous year. Due to lower prices, the increase in value over the 1948-49 level of nearly \$1.2 million was quite small. The reduced prices were largely due to the Federal Government's freight assistance on feed grains moving from Western Canada.

Quantities of hay sold were substantial although there was a drop from almost 7,300 tons in 1948-49 to 5,800 tons the year following. A somewhat larger than proportionate decline in dollar value occurred over the same period because of reduced prices brought about by reduced freight charges.

Other farm products sold were of lesser importance although the value of whole milk sold was more than \$1 million in each of the two years and the value of livestock marketed exceeded \$1 million in 1949-50.

From 1948-49 to 1949-50 the total quantity of vegetables, meats, and feeds sold increased while that of fruit, dairy products, and hay decreased. On a dollar basis, meats and dairy products increased while vegetables, fruit, feeds, and whole milk declined by a small amount.

Commercial Marketings of Local Commodities. - The figures appearing in Tables 2 and 3 under the heading of "Local" (with the exception of those for whole milk) were based on information obtained from a sample of Newfoundland farmers. Those pertaining to whole milk sales were derived from data procured directly from the dairies, producer-vendors and processing plants concerned. The coverage pertaining to milk data was more complete and hence less reliance was placed upon the sampling technique used to obtain figures for the other products.

Possibly the most significant figures related to local marketings are those for whole milk. Sales were calculated to be close to 13 million pounds valued at nearly \$1.1 million in 1948-49 and the following year a slight drop to just under 12 million pounds worth slightly over \$1 million.

Vegetables were next in importance to fluid milk. Over 20 million pounds valued at some \$594,000 were sold in 1949-50 as compared with nearly 20.4 million pounds worth \$675,000 the previous year. Meats and shell eggs were also important to the local marketings and in 1949-50 their values exceeded \$173,000 and \$122,000 respectively.

Although only small amounts of local feed grains were available for marketing, sales of hay approached 480 tons valued at over \$14,000 in 1949-50.

In 1949-50 approximately 32 per cent of the market demand for vegetables, 11 per cent of the demand for eggs, and 51 per cent of the live poultry requirements were supplied through sales of the local product. The year previous local supplies of vegetables, eggs, and live poultry amounted to 36 per cent, 12 per cent, and 51 per cent respectively.

Commercial Marketings of Non-local Commodities. - Agricultural commodities shipped into Newfoundland from other parts of Canada, the United States and other countries constituted the bulk of the market requirements for the two-year period 1948-50. Practically all of the important items such as fruit, meats, dairy products, and feeds came from outside sources. Only in vegetables, whole milk, eggs, and live poultry did the local product form an important part of the market requirements.

In 1948-49 close to 35.8 million pounds of vegetables were sold and in 1949-50 this amount increased to almost 43.6 million. Dollar value increased to

approximately \$1,554,000 in the second year. Meats, however, were by far the main commodity group in terms of value. In 1949-50 this exceeded \$10 million and was almost one-half of the total value of all products sold.

Dairy products, consisting mainly of canned milk, butter, and cheese, amounted to almost 19 million pounds valued at some \$3.3 million in 1948-49. The following year the quantity decreased to 17.8 million pounds but the overall value increased slightly. Quantities of fruit marketed showed a somewhat similar drop from 16.8 million pounds to about 14.9 million and the value dropped from approximately \$1,391,000 to \$1,308,000.

Commercial feed and feed grains were of importance. In 1949-50 the volume marketed increased by nearly 6 million pounds to reach just over 35 million pounds. The 1949-50 value of some \$1,239,000 was only a small increase over the previous year due to reduced prices of feed grains. Quantities of hay sold declined from some 6,887 tons in 1948-49 to 5,345 tons in 1949-50.

Origin of Non-local Commodities. - The origin of farm products shipped to Newfoundland in 1948-49 and for the year immediately following is presented in Table 4. It must be pointed out, however, that not in all cases was the particular commodity produced in the province or country as shown but rather was shipped from there directly to Newfoundland. Nova Scotia, for example, did not produce all of the various commodities as indicated in the table. Much of the fruit (particularly citrus) was grown in the United States, exported to dealers in Nova Scotia and then shipped to Newfoundland. The source of survey data, however, would not in each instance indicate the exact point of origin. This type of discrepancy does not alter the significance of the figures pertaining to the other provinces and foreign countries to the same degree. In most cases the extent to which each supplies the Newfoundland market is indicated in the table.

The sharp drop in imports from the United Kingdom, the United States and other foreign countries from 1948-49 to 1949-50 is evident. Fruit imports declined from approximately 8.9 million pounds to 4.5 million, vegetables decreased from some 4.9 million pounds to 2.4 million, and imports of dairy products declined from nearly 10 million pounds to the almost negligible quantity of about 120,000 pounds. Feed and feed grains shipped into Newfoundland from these countries declined from over 2 million pounds to 63,000 pounds. Imports of meats increased slightly although they did not rise much above the 1948-49 level of almost 12 million pounds.

The trend in shipments of agricultural products from the other provinces of Canada contrasted sharply with that followed by exports from other countries. In 1949-50 quantities of fruit, vegetables, dairy products, and feeds (except hay) rose considerably over the previous twelve-month period. Fruit shipped increased from approximately 8 million pounds to over 10 million, vegetable shipments rose from just under 31 million pounds to over 41 million, dairy products almost doubled from the 1948-49 level of 9 million pounds, and feed and feed grains increased from some 27 million pounds to almost 35 million. Meats from various parts in Canada increased in a somewhat similar manner to those from other countries. The 1949-50 level of slightly over 17 million pounds represented an increase of just over 1 million pounds from the previous year.

Along with supplies of agricultural products shipped from Nova Scotia to Newfoundland, those from Quebec and Ontario accounted for a large proportion of the market requirements. Prince Edward Island also shipped sizeable amounts of

* Province not known

each commodity, vegetables being the most important. Vegetable shipments from Prince Edward Island to Newfoundland increased from 6.7 million pounds in 1948-49 to over 21 million in 1949-50. Shipments of fruit, principally apples, from British Columbia increased from approximately 137,000 pounds in 1948-49 to almost 1.7 million pounds in 1949-50.

II. St. John's Market Area *

The St. John's market area was considered to be that portion of the Island supplied by distributors of agricultural products located in St. John's.

Generally speaking this would include that portion of the Island lying east of a line running from Pussthrough on the south coast to Bishop's Falls on the railway line and then to the Botwood vicinity on the northeast coast. In some cases, however, shipments are made to coastal settlements lying west of this area and to rail points as far west as Port aux Basques.

Quantities under the heading of "Non-local" in Tables 5 and 6 were those brought into St. John's from outside of the Island by the various wholesalers, jobbers, agents, and retailers and distributed by them. Quantities appearing under the heading of "Local" were supplied by farmers on the Avalon Peninsula and the adjacent coastal region lying to the northwest.

Market Receipts. - The value of all farm products sold in the St. John's market area during 1948-49 amounted to slightly more than \$13.3 million (Table 5). Of this dollar total just over \$11.8 million went to pay for products brought into St. John's from outside of the Island and approximately \$1.5 million was paid out for farm commodities grown locally. During 1949-50 the total value of agricultural commodities marketed increased to approximately \$14.1 million with \$12.7 million being spent on non-local items and close to \$1.4 million on those of local origin (Table 6).

In terms of dollars, meats sold considerably surpassed other farm products in both 1948-49 and 1949-50. For the year commencing April 1, 1948 approximately 18.8 million pounds were sold and in the subsequent twelve-month period some 20.3 million pounds were marketed. The value of meats sold reached the important levels of close to \$5.8 million in 1948-49 and nearly \$6.5 million the following year.

The quantity of vegetables sold in 1948-49 reached close to 28.7 million pounds and for the following year the quantity marketed increased to 31.4 million. The value of vegetables sold, however, decreased slightly from the 1948-49 level of almost \$1.3 million.

Fruit and dairy products occupied important positions on the market. The quantity of fruit sold in 1949-50 was approximately 9.7 million pounds, a drop from the previous year's total of 11.3 million pounds. Dollar value also declined to approximately \$824,000. Market receipts of dairy products dropped from 12.8 million pounds in 1948-49 to 9.5 million the following year and value declined from \$2.3 million to \$1.7 million.

Quantities of commercial feeds and feed grains sold increased substantially from 17.1 million pounds in 1948-49 to 23.4 million the next year although amounts

* Three pamphlets giving preliminary information on the market for vegetables, dairy products and fruit respectively in the St. John's market area in 1949-50 were published earlier and were subject to revision. Where any discrepancies between those publications and this present report occur, this report is to be considered as more accurate.

of hay sold declined slightly over the same period.

Of the other farm products sold over the two-year period, whole milk was the most important in value, reaching approximately \$914,000 in 1948-49 and \$809,000 the following year.

Commercial Marketings of Local Commodities. - The value of whole milk sold exceeded that of other single commodities in each of the two years under consideration. In 1948-49 some 9.6 million pounds of vegetables valued at slightly over \$346,000 were marketed and in 1949-50 the quantity increased to some 10.4 million pounds although the value declined. The value of meats sold in 1948-49 was slightly over \$115,000 and in the next year this increased to some \$120,000. Shell eggs were an important item on the market and in 1949-50 their value exceeded \$108,000, a substantial increase over the \$94,000 level reached the year before. Marketings of live poultry were of some importance and in 1948-49 their value reached almost \$15,000.

Of the important market commodities, only vegetables, shell eggs, and live poultry were supplied in substantial amounts. In 1949-50, 33 per cent of the market receipts of vegetables, 16 per cent of the requirements of shell eggs, and 59 per cent of the total supplies of live poultry were of local origin. The previous year local supplies constituted approximately the same portion of the total receipts.

Commercial Marketings of Non-local Commodities. - Of the non-local products marketed, meats were the main item in terms of value and in 1949-50 this amounted to nearly \$6.4 million which was an increase over the previous year's value of some \$5.6 million. In 1948-49 the quantity of vegetables brought into the St. John's market area amounted to over 19 million pounds and the following year this increased to more than 21 million. Fruit, dairy products, and commercial feeds were also brought into the market in large quantities.

The quantity of vegetables, meats, shell eggs and commercial feeds marketed increased in 1949-50 while that of fruit, dairy products, and hay declined. In terms of total value meats, shell eggs, and commercial feeds increased while vegetables, fruit, dairy products, and hay decreased.

III. Corner Brook Market Area

The Corner Brook market area was considered to be that portion of the Island supplied by distributors of agricultural products located in Corner Brook.

Generally speaking this included that portion lying west of a line running from Pushthrough on the south coast to Bishop's Falls on the railway line and then to the Botwood vicinity on the northeast coast. In some cases, however, shipments were made to rail points east of Bishop's Falls.

Quantities shown under the heading "Non-local" in Tables 7 and 8 were those brought into Corner Brook from outside of the Island by the various dealers and distributed through them. Quantities appearing under the heading "Local" were marketed by farmers in the Codroy and Humber Valleys and immediate vicinity.

Market Receipts. - In 1948-49 the total value of agricultural commodities sold in the Corner Brook market area was slightly more than \$3.3 million (Table 7). In the following year the total value of products marketed increased to over \$4.5 million (Table 8).

For the twelve-month period commencing April 1, 1949 more than 15.1 million pounds of vegetables were marketed and this represented a slight increase over the total of some 14.9 million pounds sold during the previous year. In terms of

ST. JOHN'S AND CORNER BROOK MARKETS,
AS PERCENTAGE OF NEWFOUNDLAND MARKET,
NON-LOCAL COMMODITIES, 1948-49

CHART 2

AS PERCENTAGE OF NEWFOUNDLAND MARKET,
NON-LOCAL COMMODITIES, 1949-50

CHART 3

value, meats far surpassed all other products on the market. The total of more than 6.7 million pounds sold in 1949-50 at a value of over \$2.8 million represented a substantial increase over the previous year and the dollar value was approximately 62 per cent of the value of all products sold in 1949-50.

Dairy products formed an important part of the market requirements over the two-year period under consideration and the quantity sold increased from nearly 2.9 million pounds during the year commencing April 1, 1948 to slightly more than 3 million pounds in the following year. The value of dairy products marketed rose from \$500,000 to more than \$538,000 during this period.

Considerable quantities of commercial feeds and feed grains were sold in the Corner Brook market area although the volume declined from some 4.7 million pounds in 1948-49 to 3.8 million pounds in 1949-50. The quantity of hay marketed dropped from almost 1,800 tons in 1948-49 to slightly over 1,000 tons in the following year.

Commercial Marketings of Local Commodities. - Local supplies of farm products had a total value of slightly over \$401,000 in 1948-49 and there was a decline in value to approximately \$383,330 in the year following. These values represented approximately 12 and 8 per cent respectively of the total value of market receipts in 1948-49 and 1949-50.

Vegetables were the main commodity offered for sale in each of the two years. For the year 1948-49 some 8.9 million pounds, worth almost \$268,000, were marketed and in the following twelve-month period slightly over 7.9 million pounds valued at just over \$220,000 were sold. In terms of pounds the local marketings of vegetables constituted approximately 60 and 53 per cent of the total requirements in 1948-49 and 1949-50 respectively.

The total demand for whole milk was met through local supplies. In 1948-49 some 889,000 pounds of whole milk valued at close to \$76,000 were sold and for the following year approximately 1,220,010 pounds valued at nearly \$104,000 were marketed. The combined values of vegetables and whole milk sold accounted for 86 and 84 per cent of the total value of all local products marketed in 1948-49 and 1949-50 respectively.

Commercial Marketings of Non-local Commodities. - Products brought into the market area from beyond the Island made up the bulk of the market requirements. In 1948-49 the total value of all non-local commodities sold slightly exceeded \$2.9 million (Table 7) and this represented approximately 88 per cent of the value of all market receipts. In the following year the value of non-local products sold increased to almost \$4.2 million which constituted about 92 per cent of the total value of farm products marketed.

In terms of value, meats were the main commodity group marketed during the two-year period. During 1948-49 quantities valued at nearly \$1.6 million were sold and from April 1, 1949 to March 31, 1950 meats valued at nearly \$2.8 million were marketed.

Vegetables were a most important commodity group on the market. For the 12 months commencing April 1, 1948 close to 6 million pounds were sold and for the following twelve-month period almost 7.2 million pounds were marketed.

markets to the Newfoundland market, only figures pertaining to non-local agricultural products were considered. It was felt that this treatment would sharpen the analysis and would clearly indicate the pattern that existed during the two-year period commencing April 1, 1948.

In terms of value, approximately 83 per cent of the non-local agricultural commodities marketed in Newfoundland in 1948-49 were supplied through St. John's and Corner Brook merchants. Of this combined percentage some 67 per cent was attributable to dealers in St. John's (Table 9). In 1949-50 these same two centres marketed about 82 per cent of the non-local products sold in Newfoundland with the St. John's portion being 62 per cent (Table 10).

In 1949-50 the percentage of various farm products sold through St. John's and Corner Brook distributors ranged from 65 to 100 per cent with the exception of hay which was slightly over 43 per cent by weight. In 1948-49 St. John's and Corner Brook dealers marketed from 70 to 100 per cent of the agricultural commodities sold in Newfoundland except for hay and powdered eggs which came to 50 per cent and 9 per cent by weight respectively. On a value basis the percentages were approximately the same as those pertaining to weight during the two-year period.

Of the most important commodities sold in Newfoundland during 1949-50, it was found that the St. John's and Corner Brook merchants sold 65 per cent of the vegetables, 91 per cent of the meats, 78 per cent of the fruit, 70 per cent of the dairy products and 78 per cent of the prepared commercial feeds and feed grains marketed in Newfoundland. During the preceding year, distributors in St. John's and Corner Brook marketed 70 per cent of the vegetables, 86 per cent of the meats, 78 per cent of the fruit, 83 per cent of the dairy products and 75 per cent of the commercial feeds and feed grains sold on the Island. Apart from dairy products the proportions did not alter much from 1948-49 to 1949-50.

The fact that the population of the St. John's metropolitan area combined with the population of Corner Brook city represents about 34 per cent of the Island's total population, indicates the importance of these two centres, particularly St. John's, as commercial distributing points.

MARKET DEMAND FOR FARM PRODUCTS IN NEWFOUNDLAND

(1) Local Marketings 1948-49, 1949-50

Fruit. - The quantity of fruit grown in Newfoundland is very limited and as would be expected the marketings were almost negligible during the two-year period under study. Commercial marketings in 1948-49 were valued at less than \$500 and in the following twelve-month period the value increased to some \$850 (Table 11). Strawberries and apples were the only fruit sold on a commercial basis.

Table 11. Commercial Marketings of Local Fruit in Newfoundland

Fruit	1948-49		1949-50	
	lb.	\$	lb.	\$
Apples	1,856	110	743	44
Strawberries	919	367	2,019	809
Total	2,775	477	2,762	853

Fruit Exports. - Although only small quantities of fruit are grown on Newfoundland farms for commercial purposes it is interesting to observe that blueberries are exported. These berries, which grow in large quantities on the "barrens", particularly in the St. John's and Conception Bay areas, are shipped from St. John's to the United States.

Interviews with local farmers did not indicate that sales of these berries were made by them to St. John's consumers or retailers. Since blueberries are plentiful in the St. John's area there is little or no market for them as a farm product. Residents of this area are in a position to secure their own requirements of blueberries by picking them on the "barrens". Any local selling is of a very unorganized nature and might be done by peddlers or others who have acquired surplus supplies. Some firms do handle blueberries on a commercial basis but their main returns are obtained through exporting the fruit to the United States.

Prior to 1948, five St. John's firms were engaged in this trade but they amalgamated and now operate as one firm. Based on estimates obtained from persons associated with the export trade some 375,000 pounds of blueberries valued at approximately \$31,250 were shipped from St. John's in 1948-49. During the following year these exports increased to some 1.2 million pounds with a value of about \$100,000. These amounts went to the United States. For shipping, the berries are packed in 30-pound boxes, frozen and transported in refrigerated vessels. There were indications that the importance of this export trade was realized and in order to meet the potential market demand for blueberries the growing, gathering, processing, and shipping practices were being improved.

Total	20,395,161	675,128	20,130,666	593,239

Vegetables. - Vegetable production constitutes the main enterprise in Newfoundland agriculture and accordingly substantial quantities of vegetables were

sold during the two years commencing April 1, 1948. In terms of weight, potatoes were the most important vegetable marketed with close to 9 million pounds being sold during 1948-49 and 1949-50 (Table 12). On a value basis, cabbage was the major vegetable sold with marketings of this item approaching a value of \$242,000 in 1948-49 and \$217,000 in 1949-50. Turnips were also of major importance followed by carrots, beets, lettuce, and parsnips.

Meats. - Commercial marketings of local meats in Newfoundland were valued at almost \$167,000 during 1948-49 and nearly \$174,000 during the next year (Table 13). Beef was the major item sold and during the two-year period marketings increased from some 294,000 pounds valued at almost \$113,000 to nearly 316,000 pounds, worth close to \$120,000. Lamb marketings declined noticeably from approximately 61,000 pounds in 1948-49 to about 35,000 pounds in 1949-50.

Table 13. Commercial Marketings of Local Meats in Newfoundland

Meats	1948-49		1949-50

Veal	64,649	26,688	60,923	26,920
Lamb	61,134	13,988	34,532	12,470
Total	455,387	166,739	452,159	173,707

Dairy Products. - Small quantities of farm-made butter and cottage cheese were the only dairy products of local origin marketed in Newfoundland during the two-year period beginning April 1, 1948. Their total value increased from approximately \$9,200 in the first twelve-month period to \$9,500 in the second (Table 14).

Table 14. Commercial Marketings of Local Dairy Products in Newfoundland

Dairy products	1948-49		1949-50	
	lb.	\$	lb.	\$
Butter	11,565	8,276	11,794	8,540

Whole milk	12,809,900	1,088,842	11,817,200	1,004,462

Whole Milk. - Whole milk was the most important farm product sold in Newfoundland during the two-year period. More than 12.8 million pounds valued at close

to \$1.1 million were marketed during 1948-49 and slightly more than 11.8 million pounds worth just over \$1 million were sold during 1949-50. These quantities of whole milk were sold for fluid consumption in pasteurized and raw form and for manufacturing purposes, principally ice cream making.

Poultry and Eggs. - Sales of poultry and eggs increased from a total value of approximately \$121,000 during 1948-49 to slightly over \$136,000 the following year (Table 15). During this two-year period poultry marketings decreased while egg marketings increased considerably.

Table 15. Commercial Marketings of Local Poultry and Eggs in Newfoundland

Poultry and eggs	Unit	1948-49	1949-50
Live poultry	no. head	30,754	25,905
	\$	16,225	13,769

	\$	104,305	122,285
Total value	\$	120,530	136,054

Livestock and Products. - Marketings of livestock during 1948-49 and 1949-50 were few although they did increase from 433 to 512 head (Table 16). Wool was the only livestock product (excluding meats) reported as sold and the quantity increased from some 2,400 pounds in 1948-49 to approximately 3,300 pounds in 1949-50.

Table 16. Commercial Marketings of Local Livestock and Products in Newfoundland

	\$	6,883	7,513
Wool	l b	2,417	3,265
	\$	1,296	1,843

Feed and Feed Grains. - Sales of hay and oats increased from nearly 825,000

pounds in 1948-49 to more than 972,000 pounds in 1949-50 although the total value declined from close to \$16,000 to less than \$15,000 (Table 17). This drop was due to lower prices for hay.

(2) *Non-local Marketings 1948-49, 1949-50*

Fruit.- More than 16.8 million pounds of fruit valued at close to \$1.4 million were shipped into Newfoundland during 1948-49 (Table 18). During the following year, 1949-50, shipments amounted to 14.9 million pounds worth approximately \$1.3 million. Apples were the main item on the market during the two years under con-

sideration with almost 7 million pounds sold in each twelve-month period. Oranges were second in importance with approximately 4 million pounds being sold in each of the two years. Although quantities of each type of fruit varied from the 1948-49 period to that of 1949-50 the net decline in total pounds for all fruit was approximately equal to the drop in quantities of "other dried fruit" sold.

Total	35,757,266	1,521,908	43,595,138	1,553,953

Vegetables. - In terms of volume, vegetables were the main farm product brought into the Newfoundland market during the two-year period beginning April 1, 1948. In 1949-50 close to 43.6 million pounds of vegetables valued at nearly \$1.6 million were marketed (Table 19). This represented an increase over the previous year when some 35.8 million pounds with a dollar value of slightly over \$1.5 million were sold. Potatoes were by far the main product in the group and in 1949-50 the quantity marketed approached 27 million pounds. Onions were shipped to Newfoundland in considerable quantities and their total exceeded 3 million pounds in each of the two years.

Meats. - On a value basis, meats were the most important agricultural product sold in Newfoundland during the two-year period studied. Their value increased from close to \$8.5 million during 1948-49 to slightly over \$10.3 million in the subsequent year (Table 20). The quantity of meats sold increased from nearly 28 million to more than 29.4 million during the same period. The importance of pickled beef and pickled pork is evident. These meats are brought into Newfoundland in barrels and are consumed extensively, particularly in regions where supplies of fresh meat are limited.

Table 20. Commercial Marketings of Non-local Meats in Newfoundland

Dairy Products. - Quantities of dairy products shipped into Newfoundland in 1949-50 amounted to almost 17.8 million pounds valued at close to \$3.3 million (Table 21). This was a drop in volume from the previous year when nearly 19 million pounds were sold. The total value, however, was slightly higher in 1949-50. Canned milk constituted the bulk of the dairy products brought into the Newfoundland market and the quantities sold are evidence of its place in the Newfoundland diet.

Table 21. Commercial Marketings of Non-local Dairy Products in Newfoundland

Dairy products	1948-49		1949-50	
	lb.	\$	lb.	\$
Canned milk	16,585,622	2,128,388	15,302,916	2,143,066

Total	18,951,789	3,250,187	17,794,886	3,274,167

Poultry and Eggs. - The value of non-local supplies of poultry and poultry products sold in Newfoundland increased from close to \$995,000 during 1948-49 to more than \$1.4 million during the year immediately following (Table 22). Shell eggs were the main item marketed and showed an increase in volume and value in 1949-50. Dressed poultry was of considerable importance and quantities marketed in 1949-50 represented a substantial increase over those in the previous year. Although the numbers of live poultry shipped to Newfoundland declined during the second twelve-month period the value increased.

Table 22. Commercial Marketings of Non-local Poultry and Eggs in Newfoundland

Poultry and eggs	Unit	1948-49	1949-50
Dressed poultry	lb.	553,965	1,222,344
	\$	325,195	657,450

	\$	27,908	28,112
Eggs (frozen)	lb.	-	6,059
	\$	-	1,927
Total value	\$	994,820	1,449,899

Livestock and Products. - Livestock brought into the Newfoundland market increased from 7,643 head during 1948-49 to 10,258 head during the subsequent 12 months. Their value increased from nearly \$676,000 to slightly more than \$1.2 million in the same interval (Table 23). Cattle were the main component of the livestock group and in 1949-50 their value slightly exceeded \$1 million. Small quantities of non-local wool and hides were marketed during the two-year period.

Feed and Feed Grains. - Feed and feed grains were shipped into the Newfoundland market in substantial quantities during the two-year period. In 1949-50 more than 45.7 million pounds were marketed and in the preceding year over 42.8 million pounds were sold (Table 24). Mixed commercial feeds were the principal item in the group followed by hay and oats. From 1948-49 to 1949-50 marketings of commercial feeds increased from some 19.1 million pounds to approximately 24 million pounds. Oats increased slightly from 9.8 million to 10.2 million pounds while hay declined from nearly 13.8 million to approximately 10.7 million pounds.

(3) Total Marketings 1948-49

This portion of the study dealing with total marketings of agricultural pro- in Newfoundland in 1948-49 will be confined largely to a presentation of tables showing figures for the individual commodities under each commodity group. A

summary table showing total figures for each commodity group was presented under the section dealing with "Extent of the Market". In addition, the figures for the various "local" and "non-local" items under each commodity group were dealt with under parts (1) and (2) of this section.

Fruit. - Local supplies of fruit for commercial purposes were practically non-existent. Accordingly, the total market requirements consisted practically entirely of fruit brought into Newfoundland from outside points (Table 25).

Vegetables. - Slightly more than 36 per cent of all vegetables marketed in Newfoundland during 1948-49 were produced locally (Table 26). The principal vegetables grown were potatoes, turnips, and cabbage and local marketings constituted approximately 28 per cent, 84 per cent, and 71 per cent respectively of the total demand.

Meats.- Local supplies of meats constituted less than 2 per cent of total market requirements (Table 27). Approximately 27 per cent of the demand for veal and 20 per cent of the demand for mutton and lamb were met through local marketings. Beef, however, was the principal meat produced in terms of volume.

	\$	19,864	1,296	21,160	

Livestock and Products. - A little over 5 per cent of the livestock marketed in Newfoundland during 1948-49 came from local farms (Table 30). Pigs and calves were the only types of livestock sold that were of any significance. Approximately 2,400 pounds of wool, representing close to 14 per cent of the market requirements for this product, were supplied by local farmers.

Feed and Feed Grains. - Approximately 822,000 pounds of hay and 2,800 pounds of oats were the only feeds of Newfoundland origin marketed commercially in Newfoundland during 1948-49 (Table 31). These quantities constituted less than 2 per cent of the total market demand for feeds and feed grains.

(4) Total Marketings 1949-50

Fruit. - Strawberries supplied by local farmers made up approximately 14 per cent of the total marketed in 1949-50 (Table 32). The strawberry marketings combined with those of apples represented total quantities of local fruit sold during the year.

Vegetables. - Vegetables of Newfoundland origin made up close to 32 per cent of all vegetables marketed during 1949-50 (Table 33). Potatoes, turnips, and cabbage grown in Newfoundland were marketed in large quantities and constituted approximately 25 per cent, 65 per cent, and 65 per cent respectively of total market requirements for these vegetables.

Meats. - Beef, pork, veal, mutton, and lamb from Newfoundland farms represented less than two per cent of the meats sold in Newfoundland in 1949-50 (Table 34). Although slightly over 31 per cent of the demand for veal was met through local supplies, beef was the main meat produced.

Poultry and Eggs.- More than 51 per cent of the live poultry and 11 per cent of the shell eggs sold in Newfoundland in 1949-50 were provided through local production (Table 36). The value of local shell eggs marketed exceeded \$122,000 while that of local poultry approached \$14,000.

Livestock and Products.- Calves and pigs were the only livestock produced on Newfoundland farms and marketed commercially during 1949-50 (Table 37). These made up less than five per cent of the total cattle marketings. Close to 3,300 pounds of local wool was sold during the same period.

Feed and Feed Grains.- Close to 14,000 pounds of oats and slightly more than 958,000 pounds of hay of local origin were marketed in 1949-50 (Table 38). These feeds represented only about two per cent of the total market demand for feed and feed grains.

CHART 14. - MONTHLY MARKETINGS OF NON-LOCAL FEED AND FEED GRAINS IN NEWFOUNDLAND, 1948-49, 1949-50

Seasonality of Marketings, 1948-49, 1949-50

The variation in marketings of both local and non-local farm products from month to month during 1948-49 and 1949-50 merited consideration. For purposes of indicating the trends that prevailed throughout the two-year period studied, the main commodity groups have been selected and the yearly totals previously presented were broken down on a monthly basis in this section. The commodity groups are vegetables, fruit, meats, dairy products, hay, and feed and feed grains. The details are covered largely in chart form and are confined to a consideration of quantities.

Vegetables. - Quantities of local vegetables sold from month to month during 1949-50 followed very closely the monthly marketings of the previous year, and in each twelve-month period October was the month in which the largest quantities were sold (Chart 4). Marketings in October 1949 showed a decline from the October 1948 level of some 4.7 million pounds to slightly over 4.5 million.

Marketings of non-local vegetables were characterized by an increase between the months of April and October, 1949, as compared with the same months in 1948 and a decrease between November (1949) and February (1950) compared with these months in 1948-49 (Chart 5).

The relationship between the monthly variation in the marketing of local and non-local vegetables is probably more important than that pertaining to the other commodity groups considered here. This is because over the two-year period local vegetables constituted over 30 per cent of the total market requirements of vegetables. In the case of hay, local supplies met between six and eight per cent of the demand while local meat constituted less than two per cent of the total requirements. Fruit, and feed and feed grains from local sources made up less than one per cent of the market demand over the two-year period.

There is no assurance that local farmers can alter a condition that in May 1949 enabled approximately 6.7 million pounds of non-local vegetables to be marketed while local marketings amounted to some 600,000 pounds. Soil and climate conditions, together with difficulties encountered in attempting to keep certain vegetables over a period of time, undoubtedly place severe limitations upon the Newfoundland farmers' cropping and marketing practices. However, if some thought were given to possible readjustments in their growing and selling programs, a more favorable balance might be achieved.

Fruit. - During 1948-49 marketings of local fruit were reported only in the months of July, September, and October (Chart 6). In the subsequent twelve-month period, fruit from local farms was marketed in July, August, September, and October. The quantities involved were very small in both years.

Monthly commercial marketings of non-local fruit for 1948-49 reached a peak of close to 2.8 million pounds in November (Chart 7). In 1949-50, marketings were highest in October when a total of some 3 million pounds of fruit were marketed. It was in October that the greatest difference between quantities sold throughout 1948-49 and 1949-50 appeared.

Meats. - Marketings of local meats during 1949-50 followed a very similar trend to those of the previous 12 months (Chart 8). In each year marketings reached a maximum in November when close to 100,000 pounds of meat from local farms were sold commercially.

Monthly marketings of non-local meats in 1949-50 contrasted sharply with

those of 1948-49 (Chart 9). The biggest variation occurred in September when more than 3.7 million pounds were marketed in 1949 and less than 2 million pounds were sold in 1948. The contrast was marked in February, also, when just over 1.2 million pounds were sold in 1950 compared with more than 2.3 million pounds marketed commercially in 1949.

Dairy Products.- Monthly marketings of local dairy products (consisting of butter and cottage cheese) showed little change between 1948-49 and 1949-50 and the quantities involved were not substantial (Chart 10).

Non-local marketings of dairy products showed considerable variation, on a monthly basis, between 1948-49 and 1949-50 although each year was characterized by two peak periods in amounts. During 1948-49 one peak was reached in June and another in December; in 1949-50 the first high point came in May and June and the second in October and November. Part of the explanation for this pattern lies in the fact that canned milk constitutes such an important part of this commodity group. It is brought into Newfoundland in large quantities in the late fall and is stored so that communities isolated to a great extent in the winter are assured of adequate supplies. Similarly there is another peak period in the late spring, although less pronounced, when depleted supplies are replenished.

Hay.- Local hay sold on a commercial basis in 1948-49 increased to a peak of over 180,000 pounds in November, declined and then reached a second and slightly higher peak in February (Chart 12). Monthly marketings in 1949-50 showed a similar variation although the second high point of over 260,000 pounds in February 1950 was more pronounced.

From April to September 1949 marketings of hay were considerably lower than during the same period in 1948 (Chart 13). This was contrary to what one might have expected in view of the fact that subsequent to April 1, 1949 the abolition of customs duty on hay and a reduction in the freight rate on hay from the other three Maritime Provinces lowered the cost of hay to the Newfoundland farmer. From October to December 1949, however, marketings exceeded those of the previous year and then followed a similar rate of decline. In both years the pattern of increased marketings in the late fall to provide feed for the long winter is evident. No adequate explanation appears for the sharp drop in October 1948.

Feed and Feed Grains.- From May to November in 1949 marketings of non-local feed and feed grains in Newfoundland exceeded those for the same months in 1948 (Chart 14). During the 1949-50 period, monthly amounts sold reached their peak in October when more than 6 million pounds were marketed. In the previous twelve-month period December was the main month with some 5.8 million pounds of feed and feed grains sold commercially. Supplies of local feed and feed grains marketed through regular commercial channels were negligible.

Practices and Opinions

(1) Farmers

Methods of Sale - Public market places for the sale of farm products do not exist in Newfoundland. Even in the two main cities of St. John's and Corner Brook one does not see the farmers' market which is so familiar in many Canadian cities. Farm products such as vegetables and eggs are brought into the city in small trucks or horse-drawn vehicles and sold from house to house or to retail stores.

Some quantities are purchased by wholesale firms although these are not important marketing outlets for most farmers.

Of the 245 farmers interviewed as to the channels through which their farm products were sold, 107 stated they sold mainly to retail grocers and 25 more indicated that retail grocers were second in importance when marketing. Eighty-seven producers said that most of their selling was done to households and 14 mentioned that households were their second outlet for their products. Sixteen farmers sold principally to dairies and 9 to retail butchers. Only 6 farmers replied that wholesalers were the main channel through which their products were sold, and 12 producers ranked the wholesale firms as second in importance.

Main Source of Farm Income.- Farmers were asked to indicate in order of importance the products from which the income of the farm was derived. Of the 245 operators interviewed, 89 stated that potatoes were their chief income producer and 64 said that potatoes were second in importance. Eighty-six farmers indicated that vegetables and fruit were their principal source of income and 82 ranked vegetables and fruit second. Dairy products (largely whole milk) were the first choice of 35 farm owners, 13 selected poultry and eggs as being of prime importance, and 10 stated that beef production was their main revenue source.

Opinions.- Newfoundland is faced with the problem of producing more of its own food requirements and developing better marketing methods. In order to get first-hand information regarding the farmers' thinking on these aspects of the industry each one of the 245 farm operators interviewed was asked four questions. Two of these dealt with the production phase of agriculture and two were directed towards marketing. The comments of these persons working directly in agriculture should be of considerable importance to anyone attempting to make recommendations for the improvement of the industry. After the farmers' opinions have been presented, the suggestions of a number of wholesalers and retailers for improving the marketing of Newfoundland farm products will be presented. Their comments on the quality of the local farmers' products will be summarized also.

In reply to the question "How could the marketing of Newfoundland farm products be improved to increase sales?" the 245 farm operators interviewed gave many different answers. Some 82 farmers felt that certain restrictions should be placed upon farm products coming into Newfoundland. Thirty-three farmers indicated that more organization was needed to carry out the marketing process efficiently. In line with this suggestion operators felt that establishing warehouses at key points would help considerably. Twelve farm operators suggested co-operative marketing as an improvement and 29 farmers stated that a better quality product should be developed. Improved grading and packing was suggested by 29 operators. Other replies included the reduction of freight rates, price control, elimination of peddling, development of new market areas, and advertising. Of those interviewed, 35 had no comment on this question.

In replying to a second question "Would you favor a public market place?", 127 farm operators of the 245 interviewed indicated they were not interested or that such a proposal was not applicable in their area. Nine farmers who were in favor of a public market place felt it would eliminate door-to-door peddling and four considered it would help centralize marketing. Of those opposed to such a plan, nine farm owners felt it would require more time than they had available, seven considered there was not much assurance of patronage, and four believed it would help only the larger producers.

Turning to the production aspect of the farm operations a third question "Could the production of farm products in your area be profitably increased?" was asked. Approximately 60 per cent of the farmers thought that production could be increased profitably. They indicated that more could be grown on the present cultivated land through improved methods and also that in many areas there was good land available for clearing. Farmers seemed to favor production of more potatoes, vegetables in general, and an increase in livestock numbers through additional use of pastures and cultivation of hay. Production of more vegetables was the most common suggestion although many expressed concern about the market possibilities and the price to the grower.

Dealing specifically with one product, the last question "Can the production of milk in this area be profitably increased?" was asked. Opinion seemed to be fairly evenly divided among about 90 per cent of the farmers and the remainder did not have any definite comment. Many of those who answered in the negative felt that the general lack of pastures and hay land hindered profitable expansion and others considered the distance from a market or lack of a market as being serious obstacles. Those answering in the affirmative mentioned similar conditions but felt they could be overcome successfully.

(2) Wholesalers

Distribution.- Most of the wholesalers in St. John's serve the towns along Conception Bay such as Clarke's Beach, Bay Roberts, Harbour Grace and Carbonear in addition to the area surrounding St. John's itself. These towns are connected with St. John's by road and for the most part deliveries are made by truck. Many of the wholesale firms also supply communities throughout the Avalon Peninsula and rely on rail transportation where roads are not built or as a substitute for trucking, depending upon the services. While most of the business carried out by St. John's wholesalers is confined to the Avalon Peninsula there are nevertheless sizeable quantities shipped to various towns and cities along the railway line which traverses the Island. Agricultural products are shipped inland to such centres as Gander and Grand Falls and in some cases even to Port aux Basques which is the western terminus of the rail line. In addition to rail and truck deliveries many towns and villages are supplied through St. John's dealers by water transportation. Numerous settlements on the south, east, and north coasts receive their food supplies via steamship lines or schooners operating out of St. John's.

Corner Brook wholesalers largely serve the west coast and in so doing do not have the same expansive type of distribution which characterizes much of the wholesale distribution from St. John's. Truck deliveries are concentrated in the Humber Valley area and usually are made between Petries to the west and Deer Lake to the east. Most of the wholesalers' business is done in this region. Rail shipments are not used extensively but some four wholesalers reported they supplied rail points between Port aux Basques and Millertown Junction with farm products in comparatively small amounts. Regular coastal vessels are used to a considerable extent in carrying supplies to coastal communities as far north as Labrador.

While the bulk of the farm products sold in Newfoundland are distributed through St. John's and Corner Brook, (Tables 9 and 10, pages 18 and 19) parts of the Island are supplied by other means. Large quantities of farm products are transported to the many small villages on the south coast by private schooners. Charlottetown in Prince Edward Island and North Sydney and Halifax in Nova

Scotia are the main cities from which these schooners bring their supplies. In addition, wholesalers, particularly in Nova Scotia, ship direct to the many retail grocers and butchers located in Newfoundland communities. For the most part these would be towns and cities located on the railway line as far inland as Grand Falls.

Opinions.- In the St. John's metropolitan area 68 wholesalers were asked the same question put to the farmers - "How can the marketing of Newfoundland farm products be improved to increase their sales?" Some 42 wholesalers suggested 11 different methods and 26 had no comment. Twenty-two of the wholesalers interviewed stated that improved grading was required and 15 indicated that the local product should be cleaned, packed, and labelled in a more satisfactory manner. Ten dealers mentioned that steps should be taken to centralize the marketing of local farm products, and six felt that door-to-door peddling should be abolished. Other comments included the establishment of uniform prices, improvement in storage, and improvement of the marketing board.

Ten wholesalers in the city of Corner Brook were asked the same question and four of these had no comment to offer. The six who offered suggestions indicated that improved grading and handling were needed. Two dealers suggested that co-operative marketing might help the situation.

Some 70 wholesalers in St. John's and Corner Brook were asked their opinions of the following Newfoundland farm products: potatoes, beets, carrots, cabbage, beef, pork, veal, lamb, poultry, and eggs. About one-half of the wholesalers had no comment to make on the quality of the local vegetables. However, of those who stated an opinion practically all rated the local potatoes, beets, cabbage, and carrots as "excellent" or "good". A few felt the quality was "fair" and the occasional dealer stated the quality was "poor". Very few wholesalers expressed an opinion on the beef, pork, veal, lamb, poultry, or eggs because of the small amount handled.

(3) Retailers

Opinions.- In the St. John's metropolitan area 49 retail merchants were asked "How could the marketing of Newfoundland farm products be improved to increase their sales?" The most frequent comment, particularly with regard to cabbage, turnips, carrots, beets, potatoes, and parsnips, was that grading and packing required improvement. About one-half of the retailers interviewed had this reply. Other comments received were to the effect that the supply should be regulated possibly through warehouse facilities and that prices should be at least low enough to compete with non-local products.

The replies from 12 retailers in Corner Brook were similar to those for St. John's retail dealers although the suggestion pertaining to regulated supply through centralized warehousing and marketing was stressed more. Improved grading and packing however was considered the prime requirement in improved marketing.

With regard to the quality of Newfoundland products most of the retailers in St. John's and Corner Brook rated the local vegetables and such supplies of meats, poultry, and eggs as were available as "good" or "excellent". Generally the retail grocers and meat markets felt the product itself was of good quality but that the producer should do a better job of presenting his product. This would include better cleaning and trimming of vegetables, grading of eggs, and more effort to

furnish a regular supply of meats and fowl of uniform quality. In many cases, particularly with meat, fowl, and eggs, merchants indicated that the non-local product was preferred because of continuous supply, uniform quality, and standard packaging. The local farmer, because of these conditions, was unable to capitalize on his proximity to the market.

Effect of Confederation on Market for Farm Products in Newfoundland

One of the objectives of this study was the preparation of figures to show the comparison between the market as it existed during the 12 months immediately preceding Newfoundland's entry into Confederation and the 12 months immediately following Confederation. Tables pertaining to the Newfoundland market, St. John's market area and Corner Brook market area were presented earlier in this report and showed how the marketings of individual farm commodities together with commodity groups varied from the year commencing April 1, 1948, to the year commencing April 1, 1949. Although these figures show certain variations in volume and value between 1948-49 and 1949-50 definite trends are not evident and in addition the information obtained in this market study does not indicate conclusively that Confederation was the principal factor involved.

Also included in the objective mentioned above was a comparison of the sources of origin of farm products entering Newfoundland during the year preceding Confederation and the year following. A table (Table 4) showing the comparison was presented earlier in the text and some of the more significant changes were commented upon. The general trend from 1948-49 to 1949-50 was towards a decline in shipments of fruit, vegetables, dairy products, and feeds from the United Kingdom, the United States and other foreign countries. By contrast shipments of fruit, vegetables, dairy products, and feeds (except hay) from the other provinces of Canada increased considerably on the same comparison. Imports of meats, consisting largely of pickled beef and pork, from the United States from 1948-49 to 1949-50 increased in somewhat similar proportions to those from other parts of Canada.

The explanation of this shift in source of supply probably lay in the reduced prices of Canadian products and the increased ease experienced in procuring many farm products from other parts of Canada. These changes were due largely to the abolition of import duties, reduced rail rates, and freight subsidies. While the limits of this study did not permit a detailed examination of the effect of such changes that accompanied Confederation, it seems reasonable to consider that they largely accounted for the shift in sources of certain farm products brought into Newfoundland.

A closer look at specific cases may point up some of the changes referred to in the foregoing comments. Previous to Confederation the duty on vegetables helped to maintain prices at relatively high levels and it is presumed these duties afforded local growers some measure of protection and encouraged local production. An indication of the reduction in duty which came with Confederation is shown (Table 39). *

* These figures appear in Table XV, p. 21, "Report of the Royal Commission on the Cost of Living in Newfoundland, 1950."

Table 39. Duty on Fruits and Vegetables Prior to and After Confederation

Item	Pre-Confederation	After Confederation
Apples & citrus fruit	Free	Free
Potatoes	Free	Free Aug. 1-June 14; 37¢ per 100 lb. June 15-July 31.
Turnips	45¢ per bushel	Free
Carrots	40¢ per bushel	10%
Cabbage	2½¢ per lb. July 16- April 30; 1½¢ per lb. May 1-July 14.	10%
Onions	½¢ per lb.	10%
Tomatoes	35% June 1-Nov. 30 20% Dec. 1-May 31	10%
Lettuce	55% June 1 - Nov. 30. 15% Dec. 1 - May 31	10%
Specialty	55% June 1 - Nov. 30 15% Dec. 1 - May 31	10%

Since the present reduced tariffs do not apply to vegetables brought in from other provinces of Canada, the Newfoundland farmer is faced with stronger competition and finds that lower prices for his vegetables may result. He should be considering ways of increasing his production efficiency and his marketing methods in order to capitalize on the natural advantage which his proximity to market should provide.

One of the principal factors accounting for the almost prohibitive price of fluid milk and the shortage of livestock is the high cost of feed. Farmers receive \$8.50 per cwt. for whole milk and consumers are obliged to pay approximately 30 cents per quart at the retail level but this does not seem to be a satisfactory situation. Consumers are not inclined to purchase at this price particularly when canned milk is more advantageous and farmers claim it is not profitable to produce milk because of high production costs including feed expenses.

A turn towards lower feed costs seems to have accompanied Confederation. While certain amounts of hay and grain are produced locally they are very small in comparison with total requirements. The freight charge on hay shipped from New Brunswick to Newfoundland was reduced by \$10.60 per ton and the duty of \$4.75 was removed. The reductions should help lower the Newfoundland farmer's feed bills.

Of major importance in the feed situation was the extension of the Federal Government's freight assistance on feed grains moving from Western Canada to Newfoundland. This government subsidy, which was paid on some 13,000 tons of feed grains during 1949-50, averaged about \$20.00 per ton. Although feed prices in Canada and elsewhere were rising during the first year of Confederation and the full benefit of the freight assistance program to Newfoundland was not felt, it

must, however, lead to lower feed prices for the Newfoundland farmer.

According to information obtained in this study, the principal effect during the first year of Confederation appeared to be the extent to which other provinces of Canada replaced the United States and other foreign countries as suppliers of certain farm products. The removal of certain import duties, reduced freight rates, and the feed freight assistance policy contributed to this change in source of supply.

Summary

1. On the Island of Newfoundland, which has an area of approximately 42,700 square miles and according to the 1951 Census a population of nearly 354,000, the total value of agricultural commodities sold commercially from April 1, 1948 to March 31, 1949 amounted to more than \$19.8 million. Of this amount, slightly over \$2 million was spent on farm products of Newfoundland origin.
2. During the following year (the first year after Newfoundland's entry into Confederation) the value of all commercial marketings increased to almost \$22.5 million with the value of Newfoundland products sold declining slightly to just under \$2 million.
3. In terms of dollars, meats were the most important commodity sold in both years. In 1948-49 more than 28 million pounds of meats valued at almost \$8.7 million were marketed through commercial channels and in 1949-50 almost 29.9 million pounds valued at slightly over \$10.5 million were sold.
4. Over 56 million pounds of vegetables valued at close to \$2.2 million were marketed during 1948-49 and over 63.7 million pounds with a value of approximately \$2.1 million were sold commercially in the next year.
5. The total quantity of dairy products marketed declined from close to 19 million pounds during 1948-49 to some 17.8 million pounds in the subsequent year although the total value increased by a small amount to approach \$3,284,000. Canned milk was the major item in this group.
6. During 1949-50, commercial marketings of fruit in Newfoundland declined from the 16.8 million pounds reached during the previous year to some 14.9 million pounds, and the value of fruit sold declined slightly from the 1948-49 level of \$1.4 million.
7. Feed and feed grains were second to vegetables in quantity sold during the two-year period. In 1948-49 slightly over 29 million pounds were marketed and in 1949-50 marketings increased to just over 35 million pounds. The increase in value over the 1948-49 level of nearly \$1.2 million was quite small because of lower prices. Total quantities of hay sold dropped from almost 7,300 tons in 1948-49 to some 5,800 tons during the subsequent 12 months.
8. From 1948-49 to 1949-50 the total quantity of vegetables, meats, and feeds marketed increased while that of fruit, dairy products, and hay decreased; on a value basis, meats and dairy products rose while vegetables and fruit declined by a small amount.
9. Vegetable production represented the main enterprise on Newfoundland farms during the two-year period. Nearly 20.4 million pounds of local vegetables valued at approximately \$675,000 were sold through commercial channels on the Island in 1948-49. In 1949-50 over 20 million pounds with a value of some \$594,000 were sold. These marketings of local vegetables constituted

36 per cent and 32 per cent of the total market demand for vegetables in the years 1948-49 and 1949-50 respectively.

10. Although the production and sale of fluid milk was not so widely pursued as that of vegetables, it was the chief revenue producer among the local farm products. During 1948-49 slightly over 128,000 cwt. of whole milk valued at almost \$1.1 million were sold commercially by local farmers. In the following year, 1949-50 more than 118,000 cwt. with a value of just over \$1 million were sold commercially. Local supplies of fluid milk made up practically 100 per cent of the total market demand for this product.
11. Total marketings of shell eggs in Newfoundland amounted to slightly over 1 million dozen and had a value of more than \$681,000 during 1948-49. Eggs from local farms constituted close to 12.5 per cent of the total marketed. During 1949-50 more than 1.4 million dozen eggs valued at almost \$810,000 were sold commercially. Of this total, supplies from Newfoundland farms made up almost 11.3 per cent of the total.
12. A sharp drop in imports from the United States and other foreign countries from 1948-49 to 1949-50 was evident. Imports of fruit declined from approximately 8.9 million pounds to 4.5 million, vegetable imports decreased from some 4.9 million pounds to 2.4 million and imports of dairy products declined from nearly 10 million pounds to about 120,000 pounds. Imports of meats (mainly pickled beef and pickled pork from the United States) increased slightly over the 1948-49 level of almost 12 million pounds.
13. Shipments of important farm products from other provinces of Canada to Newfoundland rose during the 1949-50 period. Fruit shipments increased from approximately 8 million pounds to over 10 million, vegetable shipments rose from just under 31 million pounds to over 41 million and dairy products almost doubled from the 1948-49 level of some 9 million pounds. Meat shipments rose to slightly over 17 million pounds in 1949-50 which was just over 1 million pounds higher than the previous year.
14. Shipments of vegetables from Prince Edward Island to Newfoundland increased from 6.7 million pounds during the 12 months beginning April 1, 1948 to more than 21 million during the next 12 months.
15. In terms of value, approximately 82 per cent of the non-local farm products marketed in Newfoundland in 1949-50 were supplied through St. John's and Corner Brook merchants. Of this combined percentage some 62 per cent was attributable to dealers in St. John's. For the preceding year these percentages were approximately the same.
16. Considering the non-local commodities of most importance sold in Newfoundland during 1949-50 it was found that the St. John's and Corner Brook merchants sold 65 per cent of the vegetables, 91 per cent of the meats, 78 per cent of the fruit, 70 per cent of the dairy products, and 78 per cent of the commercial feeds and feed grain marketed in Newfoundland.
17. In reply to the question "How could the marketing of Newfoundland farm products be improved to increase sales?" the principal comment from the farmers interviewed was that some restriction should be placed upon farm products coming into Newfoundland. The wholesalers and retailers interviewed considered the chief need was better grading, cleaning, and packaging of local products.
18. It would appear that the market for farm products in Newfoundland is a sizeable one and that local farmers could do much to further develop the potential available to them.

19. The bulk and perishability of fluid milk give the local producer an advantage in supplying this product. The fact that it was the chief revenue producer of all local farm products sold during the two-year period studied indicates that farmers are capitalizing on that. The possibility of further expanding its sale in spite of a limited pasture season and the general lack of feed grain should not be overlooked.
20. The value of meats marketed in Newfoundland from April 1, 1948 to March 31, 1950 was greater than that of any other farm product. While the Island may not be suited to beef production on a large scale the prospect of increasing sheep numbers seems worthy of consideration. This possible development is being tested at the present time. In addition, dairy animals that have outlived their usefulness as milk producers could be used to augment the supply of local beef and dairy calves would supplement the veal supply. Some consideration might be given to developing a good dual-purpose animal.
21. Considering short term developments the poultry and egg market could be attractive to a skilled poultry man. This type of enterprise could be carried on in conjunction with small-fruit production with a fair degree of success assured. On an Island where good farm land is not abundant the production of cash crops yielding a good return per acre is important. While there are many factors hindering the development of a large-scale agricultural economy in Newfoundland, there are undoubtedly certain farm enterprises that warrant careful consideration in view of the available markets.

APPENDIX A

MARKET DEMAND FOR FARM PRODUCTS IN ST. JOHN'S MARKET AREA*

(1) Local Marketings 1948-49, 1949-50

**Table A-1. - Commercial Marketings of Local Fruit
