## **Canadian Technical Report of Hydrography and Ocean Sciences**

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. The subject matter is related generally to programs and interests of the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

## **Rapport technique canadien sur l'hydrographie et les sciences océaniques**

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui ne sont pas normalement appropriés pour la publication dans un journal scientifique. Le sujet est généralement lié aux programmes et intérêts du service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Les rapports techniques peuvent être cités comme des publications complètes. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982 du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

ABSTRACT

Lively, R. R. 1984. Current meter and tide gauge observations for the Strait of Belle Isle. Can. Tech. Rep. Hydrogr. Ocean Sci. No. 46: vi + 166 p.

This report presents the results of the Strait of Belle Isle mooring experiment for the time period July 26, 1980 to October 18, 1980. The current meters were moored from the CSS Dawson during cruise 80-021 and recovered by the CSS Dawson on cruise 80-034. Also included in the report are the results of the tide gauges put in by the Canadian Hydrographic Service's Atlantic Region at the Bedford Institute of Oceanography for the same time period as the current meters.

RÉSUMÉ

Lively, R. R. 1984. Current meter and tide gauge observations for the Strait of Belle Isle. Can. Tech. Rep. Hydrogr. Ocean Sci. No. 46: vi + 166 p.

Le présent rapport renferme les résultats obtenus entre le 26 juillet et le 18 octobre 1980 dans le cadre de l'expérience de mouillage d'instruments menée dans le détroit de Belle-Isle. Les instruments de mesure des courants ont été mouillés par le Dawson lors de sa mission 80-021 et relevées par le Dawson lors de sa mission 80-034. Le rapport contient également les résultats enregistrés pendant la période susmentionnée par les marégraphes placés par les agents du Service hydrographique du Canada (région de l'Atlantique) à l'Institut océanographique de Bedford.

### Introduction

This report presents the Strait of Belle Isle current meter and tide gauge data in a graphical and statistical form for the time period July to October 1980. Also included in this report are the tide gauge data for the same time period for sites at Castle Island, North Light Belle Isle, West St. Modeste, Forteau Bay, Savage Cove, Amour Point and Ship Cove. The purpose of the project was to study the spatial and temporal variability of the circulation in the Strait and geostrophically level the permanent tide gauges at West St. Modeste and Savage Cove.

The plan was to have eight mooring sites (Fig. 1) across the Strait. The vertically and horizontally spaced instruments provided the data to examine the amplitude and phase relationships between the low frequency velocity components and to compare with a model of flow through the Strait developed from analysing old data gathered in the same locations (Garrett and Petrie, 1981), (Toulany et al. 1984). Moreover, the current meter data could be used to geostrophically level the permanent tide gauges on either side of the Strait. Both the current meter and sea level data were used to examine the circulation in the Strait.

This study should lead to a better understanding of the dynamics of flow through sea straits and permit an informed approach to the design of experiments to measure currents through the Arctic Archipelago (Garrett and Petrie 1981). Exchange of water, heat, salt and nutrients between the Gulf of St. Lawrence and Labrador Sea were examined by Juszko (1981). The long term measurements of surface current through the geostrophically levelled permanent tide gauges may be related to other flows such as the Labrador Current and thus may serve as an indicator of the circulation on the

Labrador - Newfoundland Shelf on extended time scales.

The overall return of useful data from this portion of the experiment was 62.65%. A performance chart (Fig. 2) shows the data return of each instrument. Extensive hydrographic surveys of one-two weeks duration were also carried out in the area on the cruises 80-021 and 80-034. These data are not included in this report.

#### Mooring Locations

Eight current meter stations (397 to 404) were deployed across the Strait from  $51^{\circ} 21.05'N$  and  $56^{\circ} 43.00'W$  (Savage Cove) to  $51^{\circ} 27.60'N$  and  $56^{\circ} 51.00'W$  (Amour Point). Bottom pressure gauges were deployed at seven sites throughout the Strait. A detailed layout of the current meter and tide gauge deployments can be seen in Figure 1 and Table 1. Each of the current meter deployments had two current meters at depths of 15 and 50 meters where possible, except at stations 397 and 404 where a bottom pressure gauge was used instead of the current meter at approximately 50 meters. The current meter data were collected using Aanderaa current meters, except for station 404 where a VACM (vector averaging current meter) was used at a depth of 24 meters. The bottom pressure gauges used were a mixture of Aanderaa tide gauges and Ottboro gauges. Sites 397 and 404, North Light Belle Isle, Castle Island and Ship Cove had Aanderaa tide gauges. At West St. Modeste, Forteau Bay and Savage Cove, Ottboro gauges were used. The temporary Ottboro gauge put in at Savage Cove did not work so the data from the permanent tide gauge were used.

Data Accuracy

The factory quoted accuracies for the Aanderaa current meters, VACM (vector average current meter), Aanderaa tide gauges and the Ottoboro tide gauges are as follows:

AANDERAA (RCM4 and RCM5)

Current Speed	$\pm 1$ cm/sec or $\pm 2\%$ of actual speed, whichever is greater threshold 1.5 cm/sec
Current Direction	$\pm 5$ degrees with speed 5-100 cm/sec
Crystal Timer	$\pm 2$ sec/day
Temperature	$\pm 0.15^\circ$ C
Conductivity	0 to 70 mmho/cm 0.1% range

VACM (vector averaging current meter)

Current Speed	threshold 2.57 cm/sec range 2.57 cm/sec to 308.8 cm/sec rotor constant at 34.6 cm water revolution
Current Direction	compass $0^\circ$ - $360^\circ$ , $2.8^\circ$ resolution vane $0^\circ$ - $360^\circ$ , $2.8^\circ$ resolution
Crystal Timer	$\pm 1$ sec/day
Temperature	calibrated thermistor $\pm 0.01^\circ$ C standard thermistor $\pm 0.1^\circ$ C

AANDERAA TIDE GAUGE

Pressure	0.01% of range resolution 0.001% of range
----------	--

Temperature range - 5°C to 35°C, 0.05°C

resolution 0.01%

Crystal Timer ± 2 sec/day

OTTBORO TIDE GAUGE

Pressure range 0-3m, 0-6m, 0-9m, 0-18m

± 0.02m on a 3m scale (± 0.5 of a division)

Timer ± 10-15 sec day

The Aanderaa current meters were calibrated for a temperature and salinity in house before each deployment. Pre-calibrations were found to be within the manufacturer's specifications. Compass swings (see below) were done on each Aanderaa current meter before deployment and deviations of order ± 3° were applied in processing the records.

The VACM current meter was calibrated before deployment for compass error and was found to be within the manufacturer's specifications. Temperature sensors for the VACM current meters are calibrated in-house about once every two years. Then, before each deployment the temperature sensors are tested with a resistance box to make sure they fall within range of the calibration values. The resistance box is calibrated once a year.

A pressure sensor in the Aanderaa tide gauge is calibrated once a year. The temperature sensors were calibrated before deployment and found to be within the manufacturer's specifications. However, in 1984 it was found that the pressure sensor could change by up to ± 1.3 MBAR when the temperature varied by ± 1°C. This was originally stated in the manufacturer's specifications in 1978 but not in any specification publications thereafter. The data presented in this report have not been corrected for this error. A three point calibration is done on the Ottboro tide gauges

before they go into the field. The instruments are adjusted for 0, mid chart and full scale. Time corrections are made on a day to day basis in the field.

#### Data Processing

The data that were recorded by the Aanderaa current meters were translated to computer-compatible tape. The encoder numbers were converted to physical units using several programs found in the CMSYST package available at Bedford Institute of Oceanography (AOL, 1979). A compass swing was done before each Aanderaa current meter was deployed. Each instrument was placed on a compass swing table and rotated clockwise in  $10.25^{\circ}$  increments through a complete revolution and then counterclockwise through a complete revolution. The readings for clockwise and counterclockwise revolutions were averaged to produce the calibration points used to correct the direction readings. A local magnetic variation was taken from chart 5375 (Haslan, 1981). A great deal of effort had to be applied to editing the rate because of the constant overlapping and sometimes double overlapping of the rate sensor. This was due to the large rate and a long time interval for each data cycle on the current meter. The temperature, conductivity and pressure values were used to calculate salinity using the UNESCO formula (Perkin and Lewis, 1980). No account was taken of the mismatch between temperature and conductivity sensor responses.

VACM (vector averaging current meter) data were translated to computer-compatible tape using a series of programs available from Ocean Circulation Division at Bedford Institute of Oceanography (Hendry, 1979). The speed is measured with a 10 cm Savonius rotor but direction is sensed by a small (17 x 9 cm) vane with a 1 sec time constant. Every eighth of a

revolution of the rotor, the compass and vane orientations are measured and combined to give a discrete current direction which is then converted to Cartesian velocity components (North and East). For the duration of the sampling interval, these components are summed to produce a true vector-average velocity measurement over a number of intermediate samples which is then proportional to current speed. Instantaneous direction is computed as the difference between compass and vane orientations which are recorded in 7-level binary ( $360^\circ = 128$  divisions). Temperature output is the frequency of an oscillator circuit which includes a thermistor and two sets of calibrations are needed to get from frequency to temperature (Payne *et al.* 1976).

Data that were recorded by the Aanderaa tide gauges were translated to computer-compatible tape. The encoder numbers were converted to physical units by using a set of equations (Lively, 1984) found in programs maintained by the Hydrographic Department at Bedford Institute of Oceanography. An arbitrary low water datum is selected by reducing the entire time series by the lowest pressure encountered.

The Ottboro tide gauge data are digitized from the charts using a Gradicon digitize table. Data points are then converted to an arbitrary low water datum level as mentioned above. Both Aanderaa and Ottboro tide gauge data are converted to the CMSYST format enabling further analyses to be done.

#### Data Presentation

The report contains graphical and statistical representations of current meter data moored on cruise 80-021 and tide gauge data deployed by the Hydrographic Department at Bedford Institute of Oceanography. The time

period for the above data was from July 1980 to October 1980. The data are presented in the following order:

- (a) Tidal tables which include record-mean tidal ellipses for the current velocity, tidal constituents for temperature, salinity from the current meters (Table 2), tidal constituents for pressure and temperature from the tide gauges (Table 3).
- (b) Mooring summary for the current meters deployed, giving the statistics for the raw data, plus mooring information and any comments about problems with the record.
- (c) Current velocity as a progressive vector (1-hour intervals) and stick plot filtered and subsampled at 6-hour intervals.
- (d) Rate, true direction, temperature and salinity as a time series plot (interval used at the raw data stage).
- (e) Current velocity ( $u$  and  $v$  component), temperature and salinity as a time series plot filtered and subsampled at 6-hour intervals.
- (f) Current velocity as a joint distribution diagram (interval used at the raw data stage).
- (g) Histogram of the rate (interval used at the raw data stage).
- (h) Histogram of direction (interval used at the raw data stage).
- (i) Histogram of the temperature (interval used at the raw data stage).
- (j) Histogram of the salinity (interval used at the raw data stage).

Data from the tide gauges are presented in the following order:

- (a) Mooring summary for the tide gauge deployed, giving the statistics for the raw data, plus mooring information and any comments about problems with the record.
- (b) Pressure and temperature (where applicable) as a time series plot (1-hour interval).
- (c) Pressure and temperature (where applicable) as a time series plot filtered and subsampled at 6-hour intervals.
- (d) Histogram of the pressure (1-hour interval).
- (e) Histogram of the temperature (1-hour interval).

All graphs were computer produced and plotted on an incremental plotter. Day numbers on the graphs are in Julian days. Current meter time series and stick plots, as well as tide gauge time series plots are presented in 90 day segments. The progressive vector diagrams for the current meter data are for the entire mooring period. The arrows on the progressive vector and stick diagrams represent true north. An angle section of  $54^\circ$  was used to resolve the current meter data. The filtered data at 6-hour intervals were created from 1-hour intervals using a Cartwright low-pass filter with 129 weights and a cutoff frequency of 0.036 cph (25% power is passed at 28.4 hours), (AOL, 1979). A performance chart (Fig. 2) gives the data return of each instrument moored for the entire experiment. The graphs and statistical diagrams for the current meters are ordered sequentially by consecutive station numbers and depth. The current meter presentations are followed by the graphs and statistical diagrams for the bottom pressure gauges. These are ordered sequentially by station number. Each set of diagrams for the experiment is preceded by a mooring summary table (Tables 4-25) giving the accurate depth, latitude, longitude,

sounding instrument number, statistics and comments for each instrument.

Acknowledgements

The author would like to thank Dr. B. Petrie and Dr. D. Greenberg for their advice and for reading the manuscript. Special thanks to Mrs. E Rumley for her help with the statistical tables and to Mr. E. Verge for his effort in the editting of the current meter data.

TABLE 23  
MOORING SUMMARY

MOORING	9
DEPTH (M)	0
LATITUDE	51 35.76N
LONGITUDE	56 42.00W
WATER DEPTH (M)	
MOORING DATE/CRUISE	25 / 7 / 1980 /
RECOVERY DATE/CRUISE	19 / 10 / 1980 /
DURATION (DAYS)	85.75
SAMPLING INTERVAL	60. (MIN.)
NO. OF SAMPLES	2062

SENSOR UNITS	PRESSURE MBAR
MINIMUM	25.00
MAXIMUM	190.00
MEAN	96.20
STD. DEV.	27.70

COMMENTS

PRESSURE DATA COULD NOT BE READ FOR DAYS 278 TO 279 AND DAYS 284 TO 285, THE MEAN VALUE WAS USED DURING THESE TIME PERIODS.

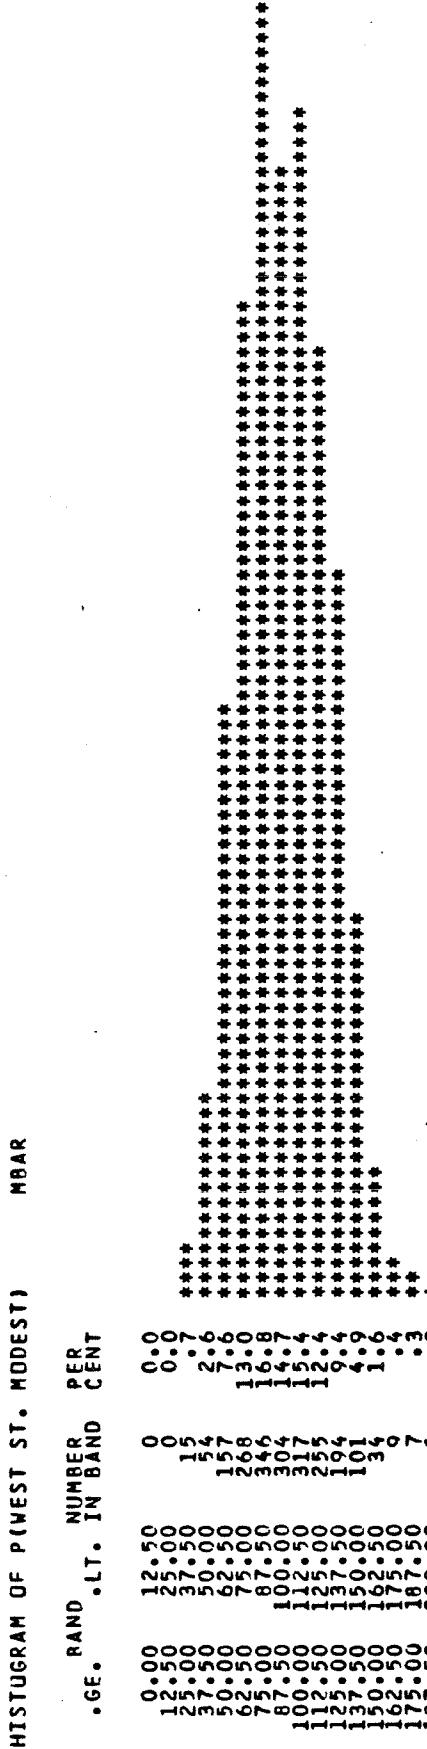

TABLE 24  
MOORING SUMMARY

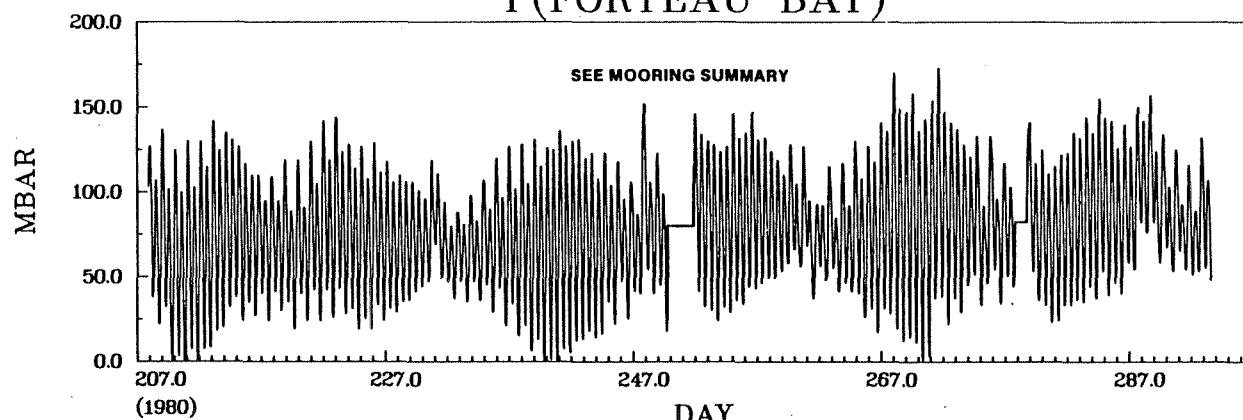

MOORING	10
DEPTH (M)	0
LATITUDE	51 28.20N
LONGITUDE	56 57.00W
WATER DEPTH (M)	
MOORING DATE/CRUISE	25/ 7/1980/
RECOVERY DATE/CRUISE	19/10/1980 /
DURATION (DAYS)	85.92
SAMPLING INTERVAL	60. (MIN.)
NO. OF SAMPLES	2057

SENSOR UNITS	PRESSURE MBAR
MINIMUM	-7.00
MAXIMUM	169.00
MEAN	78.33
STD. DEV.	33.50

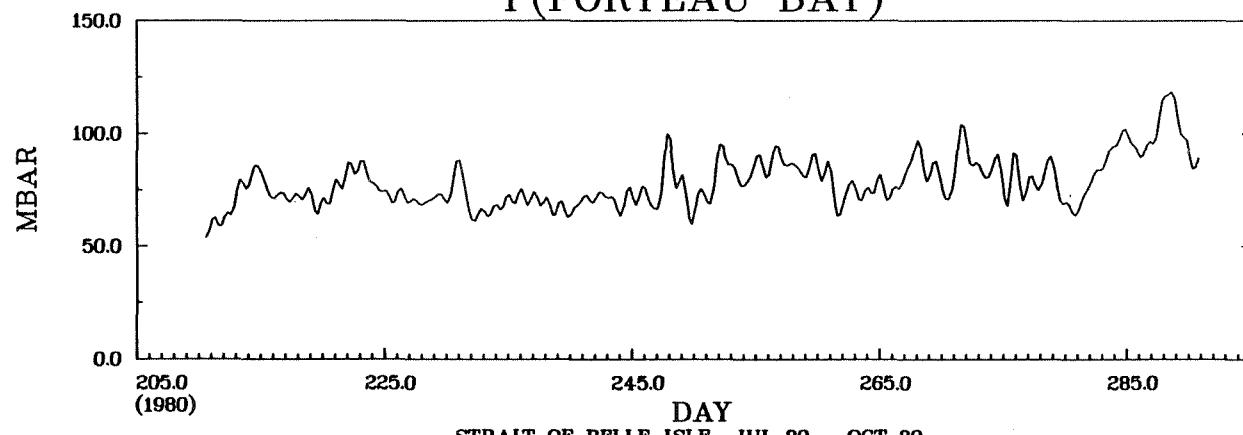

COMMENTS

PRESSURE DATA COULD NOT BE READ BETWEEN DAYS 250 AND 252,  
278 AND 279, THE MEAN VALUE WAS USED DURING THESE TIME PERIODS.

MOORING SUMMARY

MOORING	2633
DEPTH (M)	0
LATITUDE	51 36.30N
LONGITUDE	55 39.30W
WATER DEPTH (M)	
MOORING DATE/CRUISE	1 / 7 / 1980 /
RECOVERY DATE/CRUISE	1 / 11 / 1980 /
DURATION (DAYS)	123.00
SAMPLING INTERVAL	60. (MIN.)
NO. OF SAMPLES	2952
SENSOR UNITS	PRESSURE CM
MINIMUM	-8.00
MAXIMUM	160.00
MEAN	87.40
STD. DEV.	31.39

COMMENTS

THIS DATA IS FROM A MEDS PERMANENT GAUGE. THE GAUGE PUT IN BY BIO DID NOT WORK DUE TO INSTRUMENT FAILURE. THE PERMANENT GAUGE DID NOT RECORD DATA FROM DAY 214 TO DAY 269.
