

**Figure 9.** Percentages of terrestrial palynomorphs recorded in cutting kerogen samples for 105–900 m. Percentages are calculated on the sum of terrestrial palynomorphs. In some intervals, e.g. 260–280 m, the sum of terrestrial palynomorphs, which are not recycled, is very low, once the recycled palynomorphs have been subtracted from the sum of palynomorphs. Nonetheless, the paucity of nonrecycled palynomorphs is useful information for the interpretation.
