# Overview

## Proposed Registration Decision for Oxathiapiprolin

Health Canada's Pest Management Regulatory Agency (PMRA), under the authority of the *Pest Control Products Act* and Regulations, is proposing full registration for the sale and use of DuPont Zorvec Technical Fungicide, Dupont Zorvec Enicade Fungicide, Dupont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide, containing the technical grade active ingredient oxathiapiprolin, for use against selective oomycete diseases on bulb vegetables, brassica (cole) leafy vegetables, cucurbit vegetables, fruiting vegetables, leafy vegetables, ginseng, tobacco, succulent shelled and edible-podded peas, and potatoes.

Dupont Zorvec Enicade Fungicide and Orondis Fungicide are proposed oil dispersion (OD) formulations applied to soil or as a foliar spray to control downy mildew and phytophthora diseases. Dupont Zorvec Epicaltrin Fungicide and OXTP 200SC Fungicide are suspension concentrate (SC) formulations that are proposed for use as soil applied products to control certain phytophthora diseases.

An evaluation of available scientific information found that, under the approved conditions of use, the product has value and does not present an unacceptable risk to human health or the environment.

This Overview describes the key points of the evaluation, while the Science Evaluation provides detailed technical information on the human health, environmental and value assessments of DuPont Zorvec Technical Fungicide, Dupont Zorvec Enicade Fungicide, Dupont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide, containing the technical grade active ingredient oxathiapiprolin.

## What Does Health Canada Consider When Making a Registration Decision?

The key objective of the *Pest Control Products Act* is to prevent unacceptable risks to people and the environment from the use of pest control products. Health or environmental risk is considered acceptable<sup>1</sup> if there is reasonable certainty that no harm to human health, future generations or the environment will result from use or exposure to the product under its proposed conditions of registration. The Act also requires that products have value<sup>2</sup> when used according to the label directions. Conditions of registration may include special precautionary measures on the product label to further reduce risk.

---

<sup>1</sup> "Acceptable risks" as defined by subsection 2(2) of the *Pest Control Products Act*.

<sup>2</sup> "Value" as defined by subsection 2(1) of the *Pest Control Products Act*: "the product's actual or potential contribution to pest management, taking into account its conditions or proposed conditions of registration, and includes the product's (a) efficacy; (b) effect on host organisms in connection with which it is intended to be used; and (c) health, safety and environmental benefits and social and economic impact."

To reach its decisions, the PMRA applies modern, rigorous risk-assessment methods and policies. These methods consider the unique characteristics of sensitive subpopulations in humans (for example, children) as well as organisms in the environment. These methods and policies also consider the nature of the effects observed and the uncertainties when predicting the impact of pesticides. For more information on how the PMRA regulates pesticides, the assessment process and risk-reduction programs, please visit the Pesticides and Pest Management portion of Health Canada's website at [healthcanada.gc.ca/pmra](http://healthcanada.gc.ca/pmra).

Before making a final registration decision on oxathiapiprolin, the PMRA will consider any comments received from the public in response to this consultation document.<sup>3</sup> The PMRA will then publish a Registration Decision<sup>4</sup> on oxathiapiprolin, which will include the decision, the reasons for it, a summary of comments received on the proposed final registration decision and the PMRA's response to these comments.

For more details on the information presented in this Overview, please refer to the Science Evaluation of this consultation document.

## **What Is Oxathiapiprolin?**

Oxathiapiprolin is a new conventional fungicide active ingredient that prevents spore initiation and inhibits growth in susceptible fungi. It represents a new mode of action not previously available to Canadian growers.

## **Health Considerations**

### **Can Approved Uses of Oxathiapiprolin Affect Human Health?**

**Products containing oxathiapiprolin are unlikely to affect your health when used according to label directions.**

Potential exposure to oxathiapiprolin may occur through the diet (food and water) or when handling and applying the products. When assessing health risks, two key factors are considered: the levels where no health effects occur and the levels to which people may be exposed. The dose levels used to assess risks are established to protect the most sensitive human population (for example, children and nursing mothers). Only uses for which the exposure is well below levels that cause no effects in animal testing are considered acceptable for registration.

Toxicology studies in laboratory animals describe potential health effects from varying levels of exposure to a chemical and identify the dose where no effects are observed. The health effects noted in animals occur at doses more than 100-times higher (and often much higher) than levels to which humans are normally exposed when pesticide products are used according to label directions.

---

<sup>3</sup> "Consultation statement" as required by subsection 28(2) of the *Pest Control Products Act*.

<sup>4</sup> "Decision statement" as required by subsection 28(5) of the *Pest Control Products Act*.

In laboratory animals, the technical grade active ingredient (oxathiapiprolin) was of low acute toxicity by the oral, dermal and inhalation routes. It was non-irritating to skin, minimally irritating to eyes and did not cause an allergic skin reaction.

The acute toxicity of the oil dispersion (OD) end-use products, Orondis Fungicide and Dupont Zorvec Enicade Fungicide, was low via the oral, dermal and inhalation routes of exposure. The products were non-irritating to the eyes and moderately irritating to the skin. They caused allergic skin reactions; consequently, the hazard statement “POTENTIAL SKIN SENSITIZER” is required on their labels.

The acute toxicity of the suspension concentrate (SC) end-use products, OXTP 200SC Fungicide and Dupont Zorvec Epicaltrin Fungicide, was low via the oral, dermal and inhalation routes of exposure. They were non-irritating to the eyes and skin and did not cause an allergic skin reaction.

Short- and long-term (lifetime) animal toxicity tests were assessed for the potential of oxathiapiprolin to cause neurotoxicity, immunotoxicity, chronic toxicity, cancer, reproductive and developmental toxicity, and various other effects. The most sensitive endpoints for risk assessment were decreased body weight and body-weight gain and delayed sexual maturation in males. There was an indication that the young were more sensitive than the adult animal. The risk assessment protects against the findings noted above as well as any other potential effects by ensuring that the level of exposure to humans is well below the lowest dose at which these effects occurred in animal tests.

## **Residues in Water and Food**

### **Dietary risks from food and drinking water are not of health concern.**

Aggregate dietary intake estimates (food plus drinking water) revealed that the general population and infants less than one year old, the subpopulation which would ingest the most oxathiapiprolin relative to body weight, are expected to be exposed to less than or equal to 1% of the acceptable daily intake. Based on these estimates, the chronic dietary risk from oxathiapiprolin is not of health concern for all population subgroups.

Oxathiapiprolin is not carcinogenic; therefore, a cancer dietary risk assessment is not required.

Animal studies revealed no relevant health effects for acute dietary risk assessment. Consequently, a single dose of oxathiapiprolin is not likely to cause acute health effects in the general population (including infants and children).

The *Food and Drugs Act* prohibits the sale of adulterated food, that is, food containing a pesticide residue that exceeds the established maximum residue limit (MRL). Pesticide MRLs are established for The *Food and Drugs Act* purposes through the evaluation of scientific data under the *Pest Control Products Act*. Food containing a pesticide residue that does not exceed the established MRL does not pose an unacceptable health risk.

Residue trials conducted throughout Canada and the United States using oxathiapiprolin on potatoes, dry bulb onions, green onions, head lettuce, leaf lettuce, spinach, broccoli, cabbage, cauliflower, tomatoes, peppers, cucumbers, summer squash, cantaloupe, succulent peas and ginseng are acceptable. The MRLs for this active ingredient can be found in the Science Evaluation of this consultation document.

**Occupational Risks From Handling DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide are not of health concern when used according to the proposed label directions, which include protective measures.**

Workers, who mix, load or apply DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, or OXTP 200SC Fungicide, can come in direct skin contact with oxathiapiprolin residues or through inhaling spray mists during mixing/loading and application. Furthermore, workers re-entering freshly treated fields and greenhouses can come in direct skin contact with DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide residues from the treated foliage. Therefore, the OXTP 200SC Fungicide and Dupont Zorvec Epicaltrin Fungicide labels specify that during mixing, loading, application, clean-up and repair, workers must wear a long-sleeved shirt and long pants, chemical-resistant gloves, and chemical-resistant footwear plus socks. The Orondis Fungicide and Dupont Zorvec Enicade Fungicide labels specify that during mixing, loading, application, clean-up and repair, workers must wear a long-sleeved shirt and long pants, coveralls, chemical-resistant gloves, and chemical-resistant footwear plus socks. The labels also require that no one can enter treated areas for 12 hours after application.

For bystanders, exposure is expected to be much less than that for workers and is considered negligible. Therefore, health risks to bystanders are not of concern.

## **Environmental Considerations**

### **What Happens When Oxathiapiprolin Is Introduced into the Environment?**

**When used according to label directions, oxathiapiprolin is not expected to pose an unacceptable risk to the environment.**

Oxathiapiprolin can enter the environment when it is used as a fungicide for the control of oomycete diseases in a variety of field vegetable crops. It can be applied directly to plants as a foliar spray or as a soil drench, but not as both on the same crop. Oxathiapiprolin can enter into plant tissues and be distributed throughout the plant because it is systemic.

In the terrestrial environment in Canada, oxathiapiprolin can persist in the environment and has a potential to carryover to the following growing season. Breakdown of the molecule is predominantly by soil microbes which produce three major transformation products which can persist in soil. Oxathiapiprolin does not readily break down by reacting with water or sunlight. Oxathiapiprolin and two of the three major transformation products have limited potential to move through the soil to enter groundwater. One transformation product has the potential to move through soil, but was not found beyond 70 cm in depth in North American field studies. Oxathiapiprolin is not volatile and is unlikely to enter the atmosphere.

In the aquatic environment, oxathiapiprolin breaks down primarily in the presence of microbes. It does not react with water and has a limited potential to break down by reacting with sunlight in water. In water, oxathiapiprolin will move to sediments where it will be broken down by microbes. Several major transformation products were observed in water and sediments. In general, once oxathiapiprolin enters the aquatic environment it will begin to breakdown and is unlikely to be persistent in water and sediments.

Oxathiapiprolin is not expected to accumulate in fish tissues.

Overall, oxathiapiprolin and its major transformation products are not expected to pose a risk to soil-dwelling invertebrates, birds, mammals, terrestrial and aquatic plants, algae, aquatic invertebrates and fish (freshwater and marine). Plant-dwelling invertebrates within treated fields may be at risk from oxathiapiprolin at rates greater than 200 g a.i./ha. Oxathiapiprolin may present a slight risk to amphibians living in shallow water. In order to minimize the potential risk of oxathiapiprolin to terrestrial and aquatic organisms, precautionary label statements as well as mitigation measures are specified on the labels of the end use products (refer to Measures to Minimize Risk). When oxathiapiprolin is used in accordance with the label and the mitigation measures have been applied, the reduced environmental exposure is deemed adequate and the risk is considered to be acceptable.

## **Value Considerations**

### **What Is the Value of DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide?**

These oxathiapiprolin products provide a new mode of action for growers to manage downy mildew and diseases caused by *Phytophthora* species on multiple field and greenhouse crops.

The registration of oxathiapiprolin will address several priority diseases identified by Canadian growers. As a new mode of action fungicide that is effective against difficult to control oomycete fungi, oxathiapiprolin will contribute to protecting the quality of labelled crops and reducing the development of resistance in susceptible fungi while allowing alternation with other products currently registered for the same use.

## Measures to Minimize Risk

Labels of registered pesticide products include specific instructions for use. Directions include risk-reduction measures to protect human and environmental health. These directions must be followed by law.

The key risk-reduction measures being proposed on the label of DuPont Zorvec Technical Fungicide, DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide to address the potential risks identified in this assessment are as follows.

### Key Risk-Reduction Measures

#### Human Health

Because there is a concern with users coming into direct skin contact with DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide or through inhalation of spray mists, the OXTP 200SC Fungicide and Dupont Zorvec Epicaltrin Fungicide labels specify that during mixing, loading, application, clean-up and repair, workers must wear a long-sleeved shirt and long pants, chemical-resistant gloves, and chemical-resistant footwear plus socks. The Orondis Fungicide and Dupont Zorvec Enicade Fungicide labels specify that during mixing, loading, application, clean-up and repair, workers must wear a long-sleeved shirt and long pants, coveralls, chemical-resistant gloves, and chemical-resistant footwear plus socks. The labels also require that no one can enter treated areas for 12 hours after application.

#### Environment

- Environmental hazard statements are required to indicate toxicity to aquatic organisms
- Dupont Zorvec Enicade Fungicide and Orondis Fungicide labels require a hazard statement indicating that the product contains an aromatic petroleum distillate which is toxic to aquatic organisms.
- To mitigate potential exposure of amphibians through spray drift, spray buffer zones of 1 to 2 metres are required to protect sensitive aquatic habitats for foliar applications and must be specified on the labels of DuPont Zorvec Enicade Fungicide and Orondis Fungicide.
- Instructions for reducing run-off are required on the labels of all proposed end use products.
- Environmental hazard statements to indicate potential harm to beneficial invertebrates in fields receiving foliar applications at rates over 200 g a.i./ha are required.
- To minimize the potential of oxathiapiprolin to be carried over to the following growing season, a label statement informing the users of the carry-over potential of this chemical is to be specified on the labels of the proposed end use products.

## **Next Steps**

Before making a final registration decision on oxathiapiprolin, the PMRA will consider any comments received from the public in response to this consultation document. The PMRA will accept written comments on this proposal up to 45 days from the date of publication of this document. Please note that, to comply with Canada's international trade obligations, consultation on the proposed MRLs will also be conducted internationally via a notification to the World Trade Organization. Please forward all comments to Publications (contact information on the cover page of this document). The PMRA will then publish a Registration Decision, which will include its decision, the reasons for it, a summary of comments received on the proposed final decision and the Agency's response to these comments.

## **Other Information**

When the PMRA makes its registration decision, it will publish a Registration Decision on oxathiapiprolin (based on the Science Evaluation of this consultation document). In addition, the test data referenced in this consultation document will be available for public inspection, upon application, in the PMRA's Reading Room (located in Ottawa).

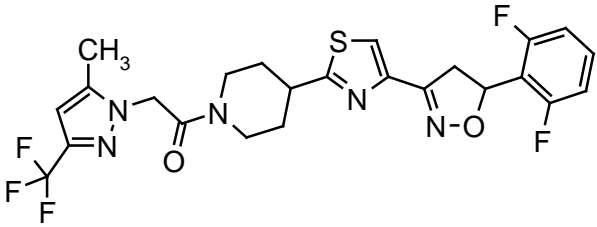

# Science Evaluation

## Oxathiapiprolin

### 1.0 The Active Ingredient, Its Properties and Uses

#### 1.1 Identity of the Active Ingredient

Active substance	Oxathiapiprolin
Function	Fungicide
Chemical name	
1. International Union of Pure and Applied Chemistry (IUPAC)	PIN (preferred IUPAC name): <i>rac</i> -1-(4-{4-[(5 <i>R</i> )-5-(2,6-difluorophenyl)-4,5-dihydro-1,2-oxazol-3-yl]-1,3-thiazol-2-yl}piperidin-1-yl)-2-[5-methyl-3-(trifluoromethyl)-1 <i>H</i> -pyrazol-1-yl]ethan-1-one <i>or</i> 1-(4-{4-[(5 <i>R</i> S)-5-(2,6-difluorophenyl)-4,5-dihydro-1,2-oxazol-3-yl]-1,3-thiazol-2-yl}-1-piperidyl)-2-[5-methyl-3-(trifluoromethyl)-1 <i>H</i> -pyrazol-1-yl]ethanone
2. Chemical Abstracts Service (CAS)	1-[4-[4-[5-(2,6-difluorophenyl)-4,5-dihydro-3-isoxazolyl]-2-thiazolyl]-1-piperidyl]-2-[5-methyl-3-(trifluoromethyl)-1 <i>H</i> -pyrazol-1-yl]-ethanone
CAS number	1003318-67-9
Molecular formula	C <sub>24</sub> H <sub>22</sub> F <sub>5</sub> N <sub>5</sub> O <sub>2</sub> S
Molecular weight	539.5 g/mol
Structural formula	 <p>The chemical structure of Oxathiapiprolin is a complex molecule. It features a central piperidine ring. Attached to the piperidine ring is a 1,3-thiazol-2-yl group, which is further substituted with a 4,5-dihydro-1,2-oxazol-3-yl group. This oxazole ring is substituted with a 5-(2,6-difluorophenyl) group and a 5-methyl-3-(trifluoromethyl)-1<i>H</i>-pyrazol-1-yl group. The piperidine ring is also substituted with a 1-(2,6-difluorophenyl)ethyl group.</p>
Purity of the active ingredient	97%

## 1.2 Physical and Chemical Properties of the Active Ingredient and End-Use Product

### Technical Product—Oxathiapiprolin Technical

Property	Result
Colour and physical state	Off-white solid
Odour	None
Melting point	For the pure active ingredient: $146.4 \pm 0.2^\circ\text{C}$ . For the technical grade active ingredient: $138.7 \pm 0.2^\circ\text{C}$ .
Boiling point	None noted, as the product decomposed after melting.
Relative density at $20^\circ\text{C}$	For the pure active ingredient: $1.4645 \pm 0.007$ . For the technical grade active ingredient: $1.4684 \pm 0.018$ .
Vapour pressure at $20^\circ\text{C}$	$1.141 \times 10^{-6}$ Pa (by extrapolation)
Henry's law constant at $20^\circ\text{C}$	$3.521 \times 10^{-3}$ Pa m <sup>3</sup> /mol
Ultraviolet (UV)-visible spectrum	pH $\lambda_{\text{max}}$ $\epsilon$ (L/mol.cm)
	1.8                      257-258                      14055
	7                      256-257                      13863
	10.5                      258-259                      16384
Solubility in water at $20^\circ\text{C}$	pH                      Solubility ( $\mu\text{g/mL}$ )
	Milli-Q water 0.1749
	4                      0.2111
	7                      0.1844
	9                      0.2060
Solubility in organic solvents at $20^\circ\text{C}$	For the pure active ingredient:
	<b>Solvent</b> <b>Solubility (g/L at <math>20^\circ\text{C} \pm 0.5^\circ\text{C}</math>)</b>
	Acetonitrile $111.0 \pm 3.9$
	Methanol $13.0 \pm 0.5$
	Acetone $147.3 \pm 6.1$
	Ethyl acetate $31.7 \pm 2.1$
	Dichloromethane $347.3 \pm 9.2$
	Toluene $5.7 \pm 0.2$
	n-Octanol $0.04 \pm 0.00$
	n-Hexane $0.01 \pm 0.00$
<i>n</i> -Octanol-water partition coefficient ( $K_{ow}$ )	pH of water $\log K_{ow}$
	Milli-Q water 3.66
	4                      3.62
	7                      3.67
	9                      3.64

Property	Result
Dissociation constant ( $pK_a$ )	No dissociation observed from pH 1.0-9.1.
Stability (temperature, metal)	Stable at elevated temperature (54°C for 14 days) and in contact with metals (aluminum and iron) and metal ions (aluminum acetate and iron(II) acetate).

### End-Use Products

Property	DuPont Zorvec Enicade Fungicide	DuPont Zorvec Epicaltrin Fungicide
Colour	Off-white	White opaque
Odour	Moderate oily characteristic odour	Chemical odour
Physical state	Liquid	Liquid
Formulation type	Oil dispersion (PMRA formulation type = suspension)	Suspension concentrate (PMRA formulation type = suspension)
Guarantee	100 g/L	200 g/L
Container material and description	0.5 – 1500 L HDPE plastic	1 – 1500 L HDPE plastic
Relative density	0.987	1.0697
pH of 1% dispersion in water	6.5	6.7
Oxidizing or reducing action	Not oxidizing or reducing	Not oxidizing or reducing
Storage stability	Stable after storage for 14 days at 54°C	Stable after storage for 14 days at 54°C
Corrosion characteristics	Not corrosive to its commercial packaging	Not corrosive to its commercial packaging
Explosibility	Not explosive	Not explosive

Property	Orondis Fungicide	OXTP 200SC
Colour	Off-white	White opaque
Odour	Moderate oily characteristic odour	Chemical odour
Physical state	Liquid	Liquid
Formulation type	Oil dispersion (PMRA formulation type = suspension)	Suspension concentrate (PMRA formulation type = suspension)
Guarantee	100 g/L	200 g/L
Container material and description	0.5 – 1500 L HDPE plastic	1 – 1500 L HDPE plastic
Relative density	0.987	1.0697
pH of 1% dispersion in water	6.5	6.7
Oxidizing or reducing action	Not oxidizing or reducing	Not oxidizing or reducing

Property	Orondis Fungicide	OXTP 200SC
Storage stability	Stable after storage for 14 days at 54°C	Stable after storage for 14 days at 54°C
Corrosion characteristics	Not corrosive to its commercial packaging	Not corrosive to its commercial packaging
Explosibility	Not explosive	Not explosive

### 1.3 Directions for Use

Dupont Zorvec Enicade Fungicide and Orondis Fungicide may be applied to foliage using field sprayers or to soil at plant in-furrow or in transplant water, or via drip irrigation. Epicaltrin Fungicide and OXTP 200SC Fungicide are intended for soil application only.

**Foliar:** Application rates for listed diseases and crops range between 8.75 – 35 g active a.i./ha with re-application intervals of five to 14 days. Rates for phytophthora root rot and foliar blight on ginseng are 70 – 280 g a.i./ha applied on a seven to 14 day interval. The product should be applied prior to disease development. Higher rates and longer intervals should be used when disease pressure is high. The maximum seasonal application rate for foliar application is 140 g a.i./ha, with the exception of ginseng which is 560 g a.i./ha.

**Soil applied (drench, chemigation, in-furrow):** Application rates for the soil phase of phytophthora blight on cucurbits, tomato, pepper and eggplant are 70 – 280 g a.i./ha to be applied on a minimum application interval of seven days. Higher rates and longer intervals should be used in heavier soils, longer intervals or for susceptible varieties. The maximum seasonal application rate for soil application is 560 g a.i./ha.

### 1.4 Mode of Action

Oxathiapiprolin inhibits the oxysterol binding protein, which prevents spore germination and inhibits germ tube formation and mycelial growth. This fungicide also induces spore collapse and death. It is currently listed as a group U15 fungicide, with a medium to high risk of resistance development.

## 2.0 Methods of Analysis

### 2.1 Methods for Analysis of the Active Ingredient

The methods provided for the analysis of the active ingredient and impurities in the technical product have been validated and assessed to be acceptable for the determinations.

### 2.2 Method for Formulation Analysis

The methods provided for the analysis of the active ingredient in the formulations have been validated and assessed to be acceptable for use as enforcement analytical methods.

## **2.3 Methods for Residue Analysis**

High-performance liquid chromatography methods with tandem mass spectrometry (HPLC-MS/MS) were developed and proposed for data generation and enforcement purposes. These methods fulfilled the requirements with regards to selectivity, accuracy and precision at the respective method limit of quantitation. Acceptable recoveries (70–120%) were obtained in plant and animal matrices. The proposed enforcement methods were successfully validated in plant and animal matrices by an independent laboratory. Adequate extraction efficiencies were demonstrated using radiolabelled crop samples analyzed with the enforcement method. Extraction solvents used in the method were similar to those used in the animal metabolism studies; thus, further demonstration of extraction efficiency was not required for the analytical method for animal matrices.

## **3.0 Impact on Human and Animal Health**

### **3.1 Toxicology Summary**

A detailed review of the toxicological database for oxathiapiprolin was conducted. The database is complete, consisting of the full array of toxicity studies currently required for hazard assessment purposes. The studies were carried out in accordance with currently accepted international testing protocols and Good Laboratory Practices. The scientific quality of the data is high and the database is considered adequate to define the majority of the toxic effects that may result from exposure to oxathiapiprolin.

Absorption of a single gavage low dose of isoxazoline or pyrazole ring-radiolabelled oxathiapiprolin was moderate in rats. Saturation of absorption was evident with very low absorption in rats following a single high dose. Oxathiapiprolin and its metabolites were readily excreted by the rat after low- and high-dose administration, with fecal excretion as the major route of elimination for all animals. Expiration as carbon dioxide or other volatile compounds was not a significant route of elimination. Retention of oxathiapiprolin or its metabolites in tissues and blood was negligible, indicating low potential for bioaccumulation. Concentrations in individual tissues were at trace levels by 168 hours after dose administration.

The metabolism of oxathiapiprolin involved multiple reaction sites including hydroxylation in various positions. The multiple reactions resulted in many identified and tentatively identified low level metabolites in feces, urine, and bile. Unmetabolized oxathiapiprolin was the chief component recovered in feces and accounted for 17-87% of the administered low- or high-dose of either radiolabel.

Toxicokinetics and metabolism were also examined with multiple, repeat-doses of oxathiapiprolin for 14 days. Similarities between peak and minimum plasma and tissue concentrations across time following single doses suggest steady-state kinetic behaviour in male and female rats. After cessation of dosing, the <sup>14</sup>C residues were readily eliminated from tissues and plasma. The overall tissue distribution in male and female rats was similar to that found after single dose administration and indicated low potential for accumulation. Feces was the predominant route of elimination, with urinary elimination of cleaved metabolites playing a minor role. Parent oxathiapiprolin was the primary radiolabeled component in feces.

Metabolism of the systemically absorbed dose was extensive and characterized by numerous identified and tentatively identified components in feces, urine and plasma. The material balance and profile of metabolites were consistent with that observed in the single dose study. Tissue-to-plasma ratios and low levels of total radioactive residues in the fat and other tissues showed no significant potential for bioaccumulation of oxathiapiprolin or its metabolites.

The acute toxicity of oxathiapiprolin was low via the oral, dermal and inhalation routes in rats. It was non-irritating to skin and minimally irritating to eyes of rabbits. Oxathiapiprolin was not a skin sensitizer in guinea pigs by the Maximization method.

The acute toxicity of the end-use products Orondis Fungicide and Dupont Zorvec Enicade Fungicide was low via the oral, dermal and inhalation routes in rats. They were non-irritating to the eyes and moderately irritating to the skin of rabbits. They were skin sensitizers in guinea pigs by the Maximization method.

The acute toxicity of the end-use products OXTP 200SC Fungicide and Dupont Zorvec Epicaltrin Fungicide was low via the oral, dermal and inhalation routes in rats. They were non-irritating to the eyes and skin of rabbits. They were not skin sensitizers in guinea pigs by the Maximization method.

Repeat dose feeding studies with oxathiapiprolin for periods of up to two years in mice, rats and dogs revealed no toxicologically significant effects up to limit doses of testing. A 28-day repeat dose dermal toxicity study in rats produced no systemic toxicity up to the limit dose of testing.

There was no evidence of mutagenic or clastogenic potential of oxathiapiprolin observed in the genotoxicity battery of studies, which included an Ames assay, an in vitro human lymphocyte clastogenicity assay, a Chinese hamster ovary cell gene mutation assay and an in vivo mouse micronucleus assay.

In a dietary multi-generation rat reproductive toxicity study, there was no parental toxicity up to the limit dose of testing. At the highest dose tested, the offspring of the F<sub>2</sub> generation exhibited decreased body weight gains between birth and post-natal day (PND) 21. An increased time to preputial separation was also noted in young males in both generations at the limit dose. The young animals demonstrated an increased sensitivity to oxathiapiprolin in this study.

In rat and rabbit oral gavage developmental toxicity studies, there were no adverse effects noted in adults or developing fetuses up to the limit dose of testing.

Functional observational batteries for neurotoxicity in rat repeat dose dietary toxicity studies were negative. In the rat acute neurotoxicity study, there were no adverse effects observed up to the limit dose of testing.

In a mouse dietary 28-day immunotoxicity study with oxathiapiprolin, there was no evidence of changes to humoral immune function or changes to spleen or thymus weight.

Several metabolites of oxathiapiprolin were tested in a battery of genotoxicity studies and a single metabolite (IN-E8S72) was tested in a dietary short-term toxicity study in rats. None of the metabolites produced effects of concern and none provided evidence that they could be more toxic than the parent molecule.

Results of the toxicology studies conducted on laboratory animals with the end-use product Orondis Fungicide, Dupont Zorvec Enicade Fungicide, OXTP 200SC Fungicide, and Dupont Zorvec Epicaltrin Fungicide and technical active oxathiapiprolin are summarized in Tables 2 and 3, respectively, of Appendix I. The toxicology endpoints for use in the human health risk assessment are summarized in Table 3, Appendix I.

## **Incident Reports**

Since April 26, 2007, registrants have been required by law to report incidents to the PMRA, including adverse effects on Canadian health or the environment. Incidents were searched for the active ingredient oxathiapiprolin. Oxathiapiprolin is a new active ingredient pending registration for use in Canada. No human or domestic animal incidents involving the active ingredient oxathiapiprolin have been reported to the PMRA.

### **3.1.1 PEST CONTROL PRODUCTS ACT Hazard Characterization**

For assessing risks from potential residues in food or from products used in or around homes or schools, the *Pest Control Products Act* requires the application of an additional 10-fold factor to threshold effects to take into account completeness of the data with respect to the exposure of, and toxicity to, infants and children, and potential prenatal and postnatal toxicity. A different factor may be determined to be appropriate on the basis of reliable scientific data.

With respect to the completeness of the toxicity database as it pertains to the toxicity to infants and children, the standard complement of required studies was available including developmental toxicity studies in rats and rabbits and a two-generation dietary reproductive toxicity study in rats.

With respect to potential prenatal and postnatal toxicity, there were no effects on fetuses up to and including the limit dose of testing in rats and rabbits. There were post-natal decreases in body weight and body weight gain in F<sub>2</sub> offspring in the rat reproductive toxicity study. Delays in preputial separation were also observed in both generations, but only at the limit dose.

Overall, the database is adequate for determining the sensitivity of the young. The effects on offspring in the reproductive toxicity, although occurring in the absence of maternal toxicity, were themselves not considered serious endpoints and occurred only at the limit dose of testing. The PEST CONTROL PRODUCTS ACT factor was accordingly reduced to 1-fold.

### **3.2 Acute Reference Dose (ARfD) for all populations**

No acute endpoints of concern were identified in the toxicology database, therefore an ARfD was not established.

### **3.3 Acceptable Daily Intake (ADI) for all populations**

To estimate risk from repeated dietary exposure, the rat 2-generation dietary reproductive toxicity study with a NOAEL of 411 mg/kg bw/day was selected for risk assessment. The LOAEL of 1196 mg/kg bw/day was based on decreased offspring body weight and body weight gain during the post-natal period and increased time to preputial separation. This study provides the lowest NOAEL in the database and was considered the most appropriate for the risk assessment. Standard uncertainty factors of 10-fold for interspecies extrapolation and 10-fold for intraspecies variability were applied. As discussed in the PEST CONTROL PRODUCTS ACT Hazard Characterization section, the *Pest Control Products Act* factor was reduced to 1-fold. The CAF is thus 100.

The ADI is calculated according to the following formula:

$$\text{ADI} = \frac{\text{NOAEL}}{\text{CAF}} = \frac{411 \text{ mg/kg bw/day}}{100} = 4 \text{ mg/kg bw/day of oxathiapiprolin}$$

### **Cancer Assessment**

There was no treatment-related increase in tumours in rats or mice; therefore, a separate cancer risk assessment was not required.

### **3.4 Occupational Risk Assessment**

#### **Short, Intermediate and Long-term Dermal Exposure**

Due to a lack of toxicological effects in the short-term repeat dose dermal toxicity study in rats up to the limit dose of testing, low dermal absorption values and the low concern for effects at the limit dose of testing in the dietary/gavage toxicity studies, dermal exposure endpoints were not selected.

## Short- and Intermediate-term Inhalation Exposure

For short- and intermediate-term exposure via the inhalation route, the dietary 2-generation reproductive toxicity study in rats was selected for risk assessment. An offspring NOAEL of 411 mg/kg bw/day was established based on decreased body weight and body weight gain in the post-natal period and increased time to preputial separation. A short-term inhalation study was not available and would not have addressed the endpoint of concern due to protocol design.

In the absence of evidence to the contrary, absorption by the inhalation route is generally assumed to be 100%. In the case of oxathiapiprolin, toxicokinetic data suggest that uptake via the gastro-intestinal tract is very low at high dose levels (approximately 5%). Therefore, a 5% route-to-route correction factor was applied to derive an offspring systemic NOAEL of 20 mg/kg bw/day for short-term and intermediate-term inhalation risk assessment.

The target MOE selected for this endpoint is 100. Ten-fold factors were applied each for interspecies extrapolation and intraspecies variability.

### 3.4.1 Toxicological Endpoints

Workers who mix/load and apply DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide are expected to be exposed for up to 180 days per year (short to intermediate-term exposure duration) since the products are applied up to 6 times per season. Workers entering treated fields and greenhouses are expected to have short to long-term exposure since the products are not expected to dissipate and there is the potential for exposure throughout the entire duration of the crop cycle.

#### 3.4.1.1 Dermal Absorption

The dermal absorption of oxathiapiprolin was determined by an *in vivo* dermal absorption study. The study was conducted on Sprague-Dawley rats using [<sup>14</sup>C]oxathiapiprolin (purity >98 %). The rate and extent of absorption of radioactivity was investigated following topical application of radiolabelled oxathiapiprolin as a nominal 0.7 g oxathiapiprolin/L aqueous dilution and as the undiluted concentrate at 100 g oxathiapiprolin/L. Only one exposure duration (6 hours) was tested, which is considered to be a minor limitation of the study since it is unclear if different lengths of exposure could result in different levels of absorption. In addition, only two termination times were tested (0 hour post-exposure and 498 hours post-exposure). Recovery of oxathiapiprolin for individual subjects ranged from 94 – 98% and no corrections for incomplete recovery were made since total recovery was acceptable. However, given the uncertainty of the amount of skin removed by each tape strip, the PMRA considers all the tape strips as a uniform layer of *stratum corneum*. For both the low and the high dose groups (7 µg/cm<sup>2</sup> & 1000 µg/cm<sup>2</sup>) the residues in excreta increased with increased time; 0.112% (LD), 0.312% (HD) & 3.019% (LD), 1.782% (HD) at 0 hour and 498 hours post-exposure, respectively.

The amount in the *stratum corneum* decreased with time; 7.82% (LD), 12.52% (HD) & 1.22% (LD), 3.49% (HD) at 0 hour and 498 hours post-exposure, respectively, which indicates that the amount found in the *stratum corneum* does become systemically absorbed with time. Therefore, all the tape strips were considered absorbable and the dermal absorption values for the high and low dose groups were 13% & 5% and 8% & 4% at 0 hour and 498 hours post-exposure, respectively.

### **3.4.2 Occupational Exposure and Risk**

Exposure to workers who mix/load and apply DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide on bulb vegetables, brassica leafy vegetables, cucurbit vegetables, fruiting vegetables, leafy vegetables, ginseng, tobacco, succulent peas, and potatoes are expected to be exposed for up to 180 days per year (short to intermediate-term exposure duration) since the products are applied up to 6 times per season. Workers entering treated fields and greenhouses are expected to have short to long-term exposure since the products are not expected to dissipate and there is the potential for exposure throughout the entire duration of the crop cycle.

#### **3.4.2.1 Mixer/Loader/Applicator Exposure and Risk Assessment**

Individuals have potential for dermal and inhalation exposure to DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide during mixing, loading and application. However, since there are no dermal endpoints due to a lack of toxicity (See section 3.4), only an inhalation risk assessment is required. Inhalation exposure estimates for workers open mixing & loading and applying using backpack, manually-pressurized handwand and mechanically-pressurized handgun were generated from PHED version 1.1.

Exposure to workers mixing, loading and applying DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide is expected to be short-term to intermediate-term in duration and to occur primarily by the inhalation routes. Exposure estimates were derived for mixers/loaders/applicators applying Orondis Fungicide and DuPont Zorvec Enicade Fungicide to greenhouse cucumbers, tomatoes, and peppers using backpack, manually-pressurized handwand and mechanically-pressurized handgun and for mixers/loaders/applicators applying DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide to bulb vegetables, brassica leafy vegetables, cucurbit vegetables, fruiting vegetables, leafy vegetables, ginseng, tobacco, succulent peas, and potatoes using open-cab groundboom. The exposure estimates are based on mixers/loaders/applicators wearing a single layer of clothing plus gloves for all application methods.

Inhalation exposure was estimated by coupling the unit exposure values with the amount of product handled per day with 100% inhalation absorption. Exposure was normalized to mg/kg bw/day by using 80 kg adult body weight.

Exposure estimates were compared to the toxicological endpoints from section 3.4.1 (NOAEL: no observed adverse effects level) to obtain the margin of exposure (MOE) in Table 3.4.2.1.1; the target MOE is 100 for inhalation exposure. No risks of concern were identified when workers followed the recommended precautions on the label.

Note that although there were no dermal health risks of concern identified for mixers/loaders/applicators wearing a single layer of clothing plus gloves for all application methods, there are potential acute dermal hazards (skin sensitizer) from handling Orondis Fungicide and Dupont Zorvec Enicade Fungicide (Section 3.1) and mixers/loaders/applicators are required to wear coveralls as a result (see Measures to Minimize Risk).

Exposure scenario	Maximum application rate (kg a.i./ha)	Volume handled per day (litres)	Area treated per day (ha/day)	Inhalation exposure <sup>1</sup> (mg/kg bw/day)	Inhalation MOE (target 100) <sup>2</sup>
Groundboom, Open mixing/loading/applying (also covers chemigation, in-furrow or banded application)	0.28	N/A	360	0.003	6,700
Backpack/Manually-pressurized handgun	0.035	150 L	1.36 <sup>3</sup>	0.00003	541,300
Mechanically-pressurized handgun	0.035	3800 L	34.54 <sup>3</sup>	0.00228	8,700

<sup>1</sup> Daily exposure = (PHED unit-exposure × rate × spray (volume/day / dilution rate) × 0.001 kg/g × 0.001mg/μg) / 80 kg bw)

<sup>2</sup> Margin of Exposure (MOE) = NOAEL<sub>(route-specific)</sub> / Exposure

<sup>3</sup> Based on the minimum dilution rate of 110 L/ha

\* Exposure was estimated for workers wearing a single layer plus gloves.

### 3.4.2.2 Exposure and Risk Assessment for Workers Entering Treated Areas

There is potential for exposure to workers re-entering areas treated with DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide to perform various activities including hand pruning, scouting, hand harvesting and handline irrigation. Given the nature of activities performed, dermal contact with treated surfaces is expected to occur throughout the season. However, since there are no dermal endpoints selected, a dermal exposure assessment is not required. Inhalation exposure is not expected to occur since workers and bystanders are not allowed to enter until 12 hours after application and the vapour pressure of oxathiapiprolin is estimated to be  $1.4 \times 10^{-6}$  kPa at 25°C. This vapour pressure is less than the NAFTA waiver for an inhalation study of  $<1 \times 10^{-5}$  kPa ( $7.5 \times 10^{-5}$  mmHg) for indoor uses, and  $<1 \times 10^{-4}$  kPa ( $7.5 \times 10^{-4}$  mmHg) for outdoor uses at 20-30°C.

### **3.4.3.3 Bystander Exposure and Risk**

Bystander exposure should be negligible since the potential for drift is expected to be minimal. Application is limited to agricultural crops only when there is low risk of drift to areas of human habitation or activity such as houses, cottages, schools and recreational areas, taking into consideration wind speed, wind direction, temperature inversions, application equipment and sprayer settings.

## **3.5 Food Residues Exposure Assessment**

### **3.5.1 Residues in Plant and Animal Foodstuffs**

The residue definition for risk assessment and enforcement in plant products and animal commodities is oxathiapiprolin. The data gathering/enforcement analytical method is valid for the quantitation of oxathiapiprolin residues in crop and livestock matrices. The residues of oxathiapiprolin are stable in representative matrices from five crop categories (high water, high oil, high protein, high starch and high acid content) for up to 18 months when stored at -20°C. Therefore, oxathiapiprolin residues are considered stable in all frozen crop matrices and processed crop fractions for up to 18 months. Oxathiapiprolin residues concentrated in the following processed commodities: dried tomatoes (6.9x) and raisins (1.5x). Quantifiable residues are not expected to occur in livestock matrices with the current use pattern. Crop field trials conducted throughout Canada and the United States using end-use products containing oxathiapiprolin at approved rates in or on potatoes, dry bulb onions, green onions, head lettuce, leaf lettuce, spinach, broccoli, cabbage, cauliflower, tomatoes, peppers, cucumbers, summer squash, cantaloupe, succulent peas and ginseng are sufficient to support the proposed maximum residue limits.

### **3.5.2 Dietary Risk Assessment**

A chronic (non-cancer) dietary risk assessment was conducted using the Dietary Exposure Evaluation Model - Food Commodity Intake Database™ (DEEM-FCID™), which incorporates food consumption data from the National Health and Nutritional Examination Survey, What We Eat in America (NHANES/WWEIA) dietary survey available through CDC's National Center for Health Statistics (NCHS).

#### **3.5.2.1 Chronic Dietary Exposure Results and Characterization**

The following criteria were applied to the basic chronic non-cancer analysis for oxathiapiprolin: 100% crop treated, default processing factors, residues of crop and animal commodities based on recommended MRL values. The basic chronic dietary exposure from all supported oxathiapiprolin food uses (alone) for the total population, including infants and children, and all representative population subgroups is less than 1% of the acceptable daily intake (ADI). Aggregate exposure from food and drinking water is considered acceptable. The PMRA estimates that chronic dietary exposure to oxathiapiprolin from food and drinking water is <1% (0.0162 mg/kg bw/day) of the ADI for the total population. The highest exposure and risk estimate is for all infants (<1 year) at 1% (0.0408 mg/kg bw/day) of the ADI.

### 3.5.2.2 Acute Dietary Exposure Results and Characterization

No appropriate endpoint attributable to a single dose for the general population (including children and infants) was identified.

### 3.5.2.3 Exposure from Drinking Water

#### Concentrations in Drinking Water

Estimated environmental concentrations (EECs) for the combined residue of oxathiapiprolin and its major transformation products in potential drinking water sources (groundwater and surface water) were generated using computer simulation models. An overview of how the EECs are estimated is provided in the PMRA's Science Policy Notice SPN2004-01, *Estimating the Water Component of a Dietary Exposure Assessment*. EECs of oxathiapiprolin in groundwater were calculated using the PRZM-GW model to simulate leaching through a layered soil profile over a 50-year period. The concentrations calculated using PRZM-GW are average concentrations in the top one metre of the water table. EECs of oxathiapiprolin in surface water were calculated using the PRZM/SWCC models, which simulate pesticide runoff from a treated field into an adjacent water body and the fate of a pesticide within that water body. Pesticide concentrations in surface water were estimated in a vulnerable drinking water source, a small reservoir.

There are more than ten transformation products in the environment for oxathiapiprolin. Very little information is available regarding their health concerns, and therefore, to be conservative, nine of the transformation products were included in the screen level modelling for drinking water from sources of surface water. The surface water residue definition includes the parent oxathiapiprolin and its transformation products- IN-RAB06, IN-RDT31, IN-Q7D41, IN-S2K66, IN-RSE01, IN-RYJ52, IN-S2K67, IN-QFD61; whereas the groundwater modelling residue definition includes oxathiapiprolin and its transformation products- IN-RAB06, IN-RDT31, IN-E8S72. The residue definition was based on the properties of the residues including their mobility in soil, persistence in the environment, where they are formed (in soil or in water), and the maximum residue levels observed in the fate studies, as well as their toxicity to human health. In the current assessment, the combined residue was modelled for drinking water. Thus environmental half-lives in soil and water were calculated for the combined residues.

A Level 1 drinking water assessment was conducted using conservative assumptions with respect to environmental fate, application rate and timing, and geographic scenario. The Level 1 EEC estimate is expected to allow for future use expansion into other crops at this application rate. Several initial application dates between April and September were modelled. The model was run to simulate a period of 50 years for all scenarios. The largest EECs of all selected runs are reported in Table 3.5.2.3-1 below.

**Table 3.5.2.3-1: Level 1 estimated environmental concentrations (parent equivalent) of the combined residue of oxathiapiprolin and major transformation products in potential drinking water sources.**

Crop	Groundwater EECs (µg a.i./L)			Surface Water EECs (µg a.i./L)		
	Daily <sup>1</sup>	Yearly <sup>2</sup>	PBT average <sup>3</sup>	Daily <sup>4</sup>	Yearly <sup>5</sup>	Average <sup>6</sup>
potatoes, tomatoes (field), squash (field), peas, onions (all), ginseng, cucumbers (field) and pumpkins (field)	511	507	379	12	3.9	3.3

- 1 90<sup>th</sup> percentile of daily average concentrations
- 2 90<sup>th</sup> percentile of yearly average concentrations
- 3 post-breakthrough average concentration
- 4 90<sup>th</sup> percentile of yearly peak concentrations
- 5 90<sup>th</sup> percentile of yearly average concentrations
- 6 50-year simulation average concentration

### 3.5.3 Aggregate Exposure and Risk

The aggregate risk for oxathiapiprolin consists of exposure from food and drinking water sources only; there are no residential uses.

### 3.5.4 Maximum Residue Limits

**Table 3.5.4-1 Proposed Maximum Residue Limits**

Commodity	Recommended MRL (ppm)
Leafy Greens (Crop Subgroup 4-13A)	15
Dried tomatoes	3.0
Green Onion (Crop Subgroup 3-07B)	2.0
<i>Brassica</i> Head and Stem Vegetables (Crop Group 5-13)	1.5
Edible-podded dwarf peas	1.0
Edible-podded peas	1.0
Edible-podded snow peas	1.0
Edible-podded sugar snap peas	1.0
Fruiting Vegetables (Crop Group 8-09)	0.5
Cucurbit Vegetables (Crop Group 9)	0.2
Ginseng roots	0.15
Succulent shelled English peas	0.05
Succulent shelled garden peas	0.05

Succulent shelled green peas	0.05
Succulent shelled peas	0.05
Bulb Onion (Crop Subgroup 3-07A)	0.04
Tuberous and Corm Vegetables (Crop Subgroup 1C)	0.01
Milk, fat, meat and meat byproducts of cattle, goats, horses, hogs and sheep	0.01

MRLs are proposed for each commodity included in the listed crop groupings in accordance with the Residue Chemistry Crop Groups webpage in the Pesticides and Pest Management section of Health Canada's website.

For additional information on Maximum Residue Limits (MRLs) in terms of the international situation and trade implications, refer to Appendix II.

The nature of the residues in animal and plant matrices, analytical methodologies, field trial data, and chronic dietary risk estimates are summarized in Tables 5, 6 and 7 in Appendix I.

## 4.0 Impact on the Environment

### 4.1 Fate and Behaviour in the Environment

Oxathiapiprolin is only sparingly soluble in water and exists in neutral form in the environmentally relevant pH range. It adsorbs strongly and has very low mobility in soils. Chemical processes including volatilization, phototransformation and hydrolysis do not contribute to the overall dissipation of oxathiapiprolin. Oxathiapiprolin has the potential to bioaccumulate in fish (log  $K_{ow}$  of 3.6); however laboratory studies show bioaccumulation is not a concern.

In the terrestrial environment in North America, oxathiapiprolin is moderately persistent to persistent. Three major transformation products, IN-RDT31, IN-RAB06, and IN-E8S72 were moderately persistent or persistent in laboratory studies with aerobic soils (all three were less than or equal to 13.5% of applied radioactivity). A minimal amount of mineralization to  $CO_2$  was observed (up to 11%). IN-E8S72 was the only transformation product observed at levels above 10% applied radioactivity in field dissipation studies (maximum 11.7%). All three major transformation products are not expected to accumulate in soil based on field dissipation studies. In the Canadian field trial sites, significant amounts oxathiapiprolin residues in soil carried over to the beginning of the next growing season (20 to 39% of applied radioactivity). A summary of environmental fate data is presented in Table 7, Appendix I, and a summary of major transformation products observed in the environment is presented in Table 8, Appendix I.

In laboratory studies oxathiapiprolin was immobile in soils, and the transformation products IN-RDT31 and IN-RAB06 had low mobility, while IN-E8S72 was very highly mobile. Oxathiapiprolin and its major soil transformation products meet some of the criteria for leaching potential according to Cohen et al. (1984), primarily for persistence in the terrestrial environment, except for IN-E8S72, which also has high mobility (Table 9, Appendix I). Based on a ground water ubiquity score (GUS) of < 1.8, oxathiapiprolin is considered a non-leacher

(Gustafson 1989). In field dissipation studies oxathiapiprolin and its three major transformation products remained mostly in the upper 30 cm of the soil profile and were only sporadically observed to a depth of 70 cm. Based on laboratory mobility studies and observed leaching in field dissipation studies, the leaching potential for oxathiapiprolin and its major transformation products is considered low; however, environmental modelling indicates that combined residues of oxathiapiprolin and its transformation products may eventually reach groundwater, given their persistence in soil.

Oxathiapiprolin can enter the aquatic environment through spray drift and overland runoff from the site of application. In the aquatic environment, oxathiapiprolin partitions from the water to the sediment where it adsorbs strongly to sediment material. Oxathiapiprolin does not hydrolyze and is slightly to moderately persistent in aerobic and anaerobic water and sediment systems. Several major transformation products were identified in laboratory studies (based on total amounts in water and sediment): IN-RYJ52, IN-S2K66, IN-Q7D41, IN-QFD61, IN-S2K67, IN-RSE01, 2-6 DFBA and IN-P3X26. The latter IN-P3X26 is formed only in the presence of sunlight; however phototransformation is not an important route of dissipation. Environmental toxicity data for the aquatic transformation products indicate they are not of concern.

## **4.2 Environmental Risk Characterization**

The environmental risk assessment integrates the environmental exposure and ecotoxicology information to estimate the potential for adverse ecological effects. This integration is achieved by comparing exposure concentrations (i.e., the expected environmental concentration (EEC)) with concentrations at which adverse effects occur (for example, toxicity endpoints such as LC<sub>50</sub>, LD<sub>50</sub>, NOEC or NOEL). For characterizing acute risk, acute toxicity values (for example, LC<sub>50</sub>, LD<sub>50</sub>, and EC<sub>50</sub>) are divided by an uncertainty factor. The uncertainty factor is used to account for differences in inter- and intra-species sensitivity as well as varying protection goals (e.g., community, population, individual). Thus, the magnitude of the uncertainty factor depends on the group of organisms that are being evaluated (*for example*, 10 for fish, 2 for aquatic invertebrates). The difference in value of the uncertainty factors reflects, in part, the ability of certain organisms at a certain trophic level (i.e., feeding position in a food chain) to withstand, or recover from, a stressor at the level of the population. When assessing chronic risk, the NOEC or NOEL is used and an uncertainty factor is not applied.

Initially, a screening level risk assessment is performed to identify pesticides and/or specific uses that do not pose a risk to non-target organisms, and to identify those groups of organisms for which there may be a potential risk. The screening level risk assessment uses simple methods, conservative exposure scenarios (for example, direct application at a maximum cumulative application rate) and sensitive toxicity endpoints. A risk quotient (RQ) is calculated by dividing the exposure estimate by an appropriate toxicity value ( $RQ = \text{exposure}/\text{toxicity}$ ), and the RQ is then compared to the level of concern (LOC = 1 for most species, 0.4 for pollinators and 2 for beneficial arthropods (acute screening tests for predatory mite and parasitoid wasp)). If the screening level RQ is below the LOC, the risk is considered negligible and no further risk characterization is necessary. If the screening level RQ is equal to or greater than the level of concern, then a refined risk assessment is performed to further characterize the risk. A refined assessment takes into consideration more realistic exposure scenarios (such as drift to non-target

habitats) and might consider different toxicity endpoints. Refinements may include further characterization of risk based on exposure modelling, monitoring data, results from field or mesocosm studies, and probabilistic risk assessment methods. Refinements to the risk assessment may continue until the risk is adequately characterized or no further refinements are possible.

The environmental risk of oxathiapiprolin and its related end-use products to non-target organisms was assessed based upon the maximum annual application rate of 560 g a.i./ha for soil applications to field vegetables in Crop Groups 8 and 9, or foliar application to ginseng (for example, 2 × 280 g a.i./ha, with a 7-day interval). All other foliar crops have a maximum seasonal rate of 140 g a.i./ha (i.e., 4 × 35 g a.i./ha, with a 5-day interval), applied by field sprayer with a minimum spray quality of ASAE fine.

A summary of EEC values used for the screening level risk assessment is presented in Tables 11, 12 and 13, Appendix I. Where required, refined EECs are presented in Appendix I for relevant species (i.e., Table 17 for foliar-dwelling organisms, and Tables 24 and 25 for amphibians).

#### **4.2.1 Risks to Terrestrial Organisms**

A risk assessment of oxathiapiprolin and its end-use product- formulations oxathiapiprolin 100 g/L OD (for example, Dupont Zorvec Epicaltrin Fungicide and Orondis Fungicide) and Oxathiapiprolin 200 g/L SC (for example, Dupont Zorvec Epicaltrin and OXTP 200SC Fungicide) was undertaken for terrestrial organisms based on available toxicity data. A summary of terrestrial toxicity data is presented in Table 13, Appendix I. Results of the accompanying risk assessment are presented in Tables 16 to 24, Appendix I.

At the screening level, EECs for direct on-field application were considered for soil dwelling organisms, birds, mammals and terrestrial vascular plants. During a refined risk assessment for foliar dwelling arthropods, off-field EECs resulting from spray drift were considered (for example, 11% drift for field sprayers using an ASAE Fine spray quality).

#### **Earthworms and soil dwelling arthropods**

Earthworms: To assess the toxicity to earthworms (*Eisenia fetida*), acute and chronic laboratory studies were conducted. Significant mortality was not observed in the acute laboratory studies with oxathiapiprolin, oxathiapiprolin 100 g/L OD, oxathiapiprolin 200 g/L-SC and the transformation products IN-E8S72, IN-QPS10, IN-RAB06, IN-RDT31. The corresponding LC<sub>50</sub> values were all greater than the highest test concentrations (for example, >100 to >1000 mg a.i./kg soil dry weight (dw), depending on test substance). On a chronic basis, no significant effects on juvenile growth and survival were observed. The NOEC value for oxathiapiprolin was 1000 mg a.i./kg soil dw and the NOEC values for the transformation products were all 100 mg a.i./kg soil dw.

All acute and chronic screening level risk quotients for earthworms were below the level of concern for oxathiapiprolin and its soil transformation products.

**Soil-dwelling arthropods:** To assess the toxicity to soil-dwelling arthropods (represented by a soil mite (*Hypoaspis aculeifer*) and a springtail (*Folsomia candida*)), chronic laboratory studies were conducted with oxathiapiprolin, oxathiapiprolin 100 g/L OD, and the transformation products IN-E8S72, IN-QPS10, IN-RAB06, IN-RDT31. For soil mites, significant reductions in reproduction occurred from exposure to IN-QPS10 and IN-RAB06 (NOEC = 50 and 25 mg a.i./kg soil dw, respectively). For springtails, adverse effects on adult mortality and reproduction were observed for oxathiapiprolin and oxathiapiprolin 100 g/L OD (NOEC = 25 mg a.i. /kg soil dw for both).

The levels where toxic effects were observed exceeded the maximum proposed application rates and as a result, all chronic screening level risk quotients for soil-dwelling arthropods were below the level of concern for oxathiapiprolin and its soil transformation products.

### **Beneficial foliage-dwelling arthropods**

To assess the toxicity on foliar-dwelling arthropods, acute and extended laboratory studies and field studies were conducted with oxathiapiprolin 100 g/L OD.

**Screening level:** The screening level risk assessment for foliar-dwelling organisms exposed to oxathiapiprolin considers the acute toxicity obtained from laboratory experiments using glass plates. Three species were exposed to the oxathiapiprolin 100 g/L OD formulation: parasitoid wasp (*Aphidius rhopalosiphi*), predatory mite (*Typhlodromus pyri*) and green lacewing (*Chrysoperlea carnea*). The 48-hour acute LR<sub>50</sub> for parasitoid wasp was 114 g a.i./ha and the 14-day acute LR<sub>50</sub> for the predatory mite and green lacewing were >200 g a.i./ha.

At the highest foliar application rate of 2 × 280 g a.i./ha per season for ginseng crops, the screening level risk quotients marginally exceeded the level of concern of 2.0 for all three species (RQ values ranged from < 2.26 to 3.96).

When considering the off-field scenarios (Table 16, Appendix I), the EEC was adjusted for deposition 1 m downwind for an ASAE fine field spray (11% deposition). The resulting risk quotient values for all indicator species were below the level of concern, indicating a negligible risk for beneficial arthropods off-field.

**Tier I refined risk characterization:** The tier I refinement for parasitoid wasps considers the toxicity endpoints LR<sub>50</sub> or ER<sub>50</sub> of >200 g a.i./ha, obtained from a 48-hour extended test with *A. rhopalosiphi* exposed to residues on plant leaf surfaces. Using the same in-field and off-field EECs, risk quotient values are calculated (Table 17, Appendix I). The refined level of concern of 1.0 is still exceeded for on-field exposure; however, as an LR<sub>50</sub> or ER<sub>50</sub> was not reached up to 200 g a.i./ha, there is uncertainty as to whether effects are likely to be seen for foliar application to crops at 2 × 280 g a.i./ha (i.e., ginseng). As there was no mortality or plant avoidance or significant reductions in parasitization efficiency ( $\alpha = 0.05\%$ ) seen in wasps up to 200 g a.i./ha, the risks to beneficial arthropods on-field are expected to be negligible for all other proposed foliar uses (with a maximum seasonal rate of 140 g a.i./ha).

**Tier II refinement:** Exposure was further characterized with the use of in-field plant interception factors for ginseng, which is the only crop with a foliar application above 140 g a.i./ha. Applying foliar deposition fractions ( $F_{int}$ ) for beans (a representative leafy crop) that range from 0.25 – 0.80 depending on crop stage, would result in in-field EECs ranging from 113 – 362 g a.i./ha. Corresponding RQs would range from <0.57 to <1.81, indicating a minimal potential for risk to in-field foliar-dwelling arthropods.

Additional data from three field studies conducted on predatory mites in European vineyards showed no significant reduction in predatory mite populations greater than 50% compared to controls at cumulative seasonal rates up to 180 g a.i./ha when exposed to oxathiapiprolin 100 g/L OD formulation. The maximum population reduction observed was 20.4% at six days after the second application (Table 18, Appendix I), with evidence of some recovery in populations by study termination (11.3% population reduction by 28 days after the third application). This rate is greater than the maximum foliar application rate for all crop uses except for ginseng. Therefore, the use of oxathiapiprolin is not expected to pose a risk to beneficial arthropods in crops at rates of up to 180 g a.i./ha. There is however, uncertainty in the amount of risk to foliar-dwelling arthropods at rates up to 560 g a.i., as extended laboratory tests and field studies were conducted at rates up to 200 g a.i./ha only. Therefore, a hazard statement for beneficial arthropods will be required for product labels with foliar application rates greater than 200 g a.i./ha (for example, foliar ginseng use at  $2 \times 280$  g a.i./ha).

## Honeybees

Toxicity data for acute oral and contact exposure to adult bees was available for oxathiapiprolin, the formulated end-use product formulations for oxathiapiprolin 100 g/L OD, oxathiapiprolin 200 g/L SC and the transformation products IN-E8S72 and IN-WR791. IN-WR791 is a plant metabolite and IN-E8S72 is closely related to another plant metabolite IN-SKS67, a glucose conjugate of IN-E8S72 that rapidly converts to IN-E8S72. The risk to adult bees was determined for exposure to the technical active ingredient. The endpoints for the two end-use products were equal to, or greater than for the technical active ingredient (Table 13, Appendix I). Additional data from semi-field exposure of honeybees to oxathiapiprolin 100 g/L OD was also considered. The risk assessment did not include an assessment of the oxathiapiprolin transformation products IN-E8S72 and IN-WR791 because the oral and contact  $LD_{50}$ 's were all > 100  $\mu$ g a.i./bee with the exception of IN-WR791 (oral  $LD_{50}$  > 56.2  $\mu$ g a.i./bee) which would classify them as relatively non-toxic according to the classification scheme of Atkins et al. 1981. All endpoints available for risk assessments are summarised in Table 13, Appendix I.

## Tier I studies:

**Contact exposure (foliar applications):** Honeybees can be exposed to oxathiapiprolin from direct application or contact with treated plant material. In order to compare the application rate to the acute contact toxicity endpoint derived in laboratory studies ( $\mu$ g a.i./bee), a conversion from kg a.i./ha to  $\mu$ g a.i./bee is required. The proposed upper-bound residue value for estimating exposure to honeybees is based on the maximum residue value reported by Koch and Weisser 1997 (2.4  $\mu$ g a.i./bee per 1 kg a.i./ha). The estimated residues per bee following a single application of 280 g a.i./ha is 0.67  $\mu$ g a.i./bee. A risk quotient (RQ) was calculated by dividing

this value by the 72-h contact LD<sub>50</sub> value of >100 µg a.i./bee for the technical active ingredient. The Level of Concern (LOC) for the Tier 1 acute exposure is 0.4. The calculated RQ is <0.01 (Table 19, Appendix I) which does not exceed the LOC of 0.4, therefore foraging worker bees are not expected to be at risk from direct contact exposure of oxathiapiprolin residues following single foliar applications at 280 g a.i./ha.

Oral exposure (foliar applications): The acute oral exposure estimate for adult bees is calculated by multiplying the single application rate (280 g a.i./ha) by 29 µg a.i./bee per kg a.i./ha. This conversion is based on nectar consumption rates for forager bees (0.292 g/day) primarily derived from Rortais et al (2005) and Crailsheim et al (1992 and 1993) and concentrations in pollen and nectar (98 µg a.i./g) estimated from the T-Rex model. Following the conversion, the estimated oral exposure is 8.01 µg a.i./bee based on the single application rate. The acute risk quotient (RQ) is calculated by dividing this value by the 48-h oral LD<sub>50</sub> value of >40.26 µg a.i./bee for the technical. The calculated acute RQ is <0.20 (Table 19, Appendix I) which does not exceed the LOC of 0.4; therefore, oxathiapiprolin in nectar and pollen following foliar applications is not expected to pose a risk to foraging adult bees.

Oral exposure (soil applications): For soil treatments, bees will be exposed via dietary consumption of pollen and nectar that are contaminated as a result of systemic transport of pesticides from soil. For these application types, it is assumed that honeybees will not be directly exposed through contact. The method for estimating dietary exposures to bees resulting from soil treatments is based on an empirically based model developed by Briggs et al. 1982 and 1983, with modifications (referred to as “the Briggs’ Model”). This model relates the Log Kow of a chemical to its concentration in plant shoots, which can be used as a surrogate for concentrations in nectar and in pollen. The concentration in nectar and pollen estimated by the Briggs model following a soil application at 280 g a.i./ha and using a Log Kow of 3.6 and the mean Koc value of 8790 mL/g for a number of soils is 0.021 µg a.i./g. The estimated concentration in pollen and nectar may be converted to a dietary-based exposure for adult worker bees using the consumption rates for nectar (0.292 g/day). The calculated acute oral-based exposure for adult bees is therefore 0.006 µg a.i./bee. An acute risk quotient (RQ) is calculated by dividing this value by the 48-h oral LD<sub>50</sub> value of >40.26 µg a.i./bee for the technical. The calculated RQ is <0.01 (Table 19, Appendix I) which does not exceed the LOC of 0.4; therefore, foraging worker bees are not expected to be at acute risk following soil applications at 280 g a.i./ha.

### **Semi-field Tunnel Studies**

Semi-field studies shift the focus from exposure and effects on individual bees to that of the intact colony. Compared to laboratory studies where exposure is to individual organisms and typically through a single route (for example, contact or oral), semi-field studies can provide clearer lines of evidence for linking multiple routes of exposure to adverse ecological effects. Semi-field studies are also useful for determining the extent to which effects on individual bees identified in Tier 1 laboratory studies are expressed at the colony level. As a larval/brood development study was not submitted for oxathiapiprolin, the results of one semi-field study that was provided (PMRA document number 2364661) were further evaluated.

The effects of Oxathiapiprolin formulation DPX-QGU42 100 g/L OD were tested on the honeybee (*Apis mellifera* L.) under semi-field conditions following the OECD guidance document No. 75 (2007). The guideline was developed to determine the likelihood of adverse effects of a chemical on bee brood development. The formulation was applied three times at rates of 60 (T1), 120 (T2), and 180 g a.i./ha (T3) to field of test plants (*Phacelia tanacetifolia*). The third application was conducted when plants were flowering at day time and when bees were foraging. Honeybee (*Apis mellifera*) hives were exposed to treated plants for 7 days in the tunnel, and then monitored for additional 18 days at another site that was approximately 7 km away from the exposure site. The study included a negative control using tap water and a positive control using fenoxycarb at 150 g a.i./ha that was applied once at the same time when the third application was applied in the treatment groups. There were three replicates for each treatment.

No treatment-related or biologically relevant effects on the number of dead bees of all ages, flight activity, hive strength were observed in the treatment at 3x120 g a.i./ha and less (T1 and T2). The treatment of 3x180 g a.i./ha (T3) did not show any treatment-related effects on honeybees at the colony level at the end of study based on the hive strength and total number of brood. It was noted that the study also did not detect the effects at the colony level for the reference chemical, fenoxycarb at 150 g a.i./ha. However, potentially slight effects of the application three times per treatment at a rate of 180 g a.i./ha (Treatment 3) on the mortality of pupae and young honeybees at the individual level may not be excluded.

In the study, slight but statistically higher numbers of total dead pupae and young bees were found in the treatment with the test chemical at 3x180 g a.i./ha (T3) during the whole post-application period after the application during flowering (DAA0-25). The mean number of dead pupae, dead young bees and dead malformed pupae and adult bees during this period was 7.0, 7.3, 6.7, 15.7 and 69.7 bees per hive in the Control, T1, T2, T3 and fenoxycarb reference (R) treatments respectively. The differences were statistically significant for the T3 and R treatments ( $p \leq 0.05$ ; Dunnett's one-sided t-test). However, mortality in T3 was low and was within the range of variation observed during the hive acclimatization period in the test tunnel (DAA-5 to 0). When comparing the mortality during the first 7 days post application (DAA0-7) in T3 to the rest of the observation period (DAA8-25), the majority of mortalities occurred within the first week post application; mortalities in T3 during DAA8 -25 were similar to controls, suggesting possible recovery for the young in the hives. In contrast, mortality of the young remained high throughout the entire observation period for the bees exposed to the reference chemical. It was noted that the mortality in the treatment at 3x180 g a.i./ha during DAA0-25 was clearly lower than that in the positive control during the same period of time, indicating the effect of the treatment was not as strong as the reference chemical at the test rate

Using marked brood cells, the study found the mean brood index and the mean brood compensation index were consistently lower in the treatment than in the control, and the mean of brood termination rate was higher in the treatment than in the control at the end of study. However, the differences were slight and not statistically significant, likely because of the large data variation in the study.

## Risk Assessment Conclusions

Acute toxicity testing with young adult bees indicates that oxathiapiprolin is practically non-toxic to honeybees on an acute contact exposure basis ( $LD_{50}$  value of  $>100 \mu\text{g a.i./bee}$ ) and on an acute oral exposure basis ( $LD_{50}$  value of  $>40.26 \mu\text{g a.i./bee}$ ). Risk quotients for both were below the LOC of 0.4. The risk from formulated enduse products Oxathiapiprolin 100 g/L OD and Oxathiapiprolin 200 g/L SC to young adult honeybees are not expected to be any greater than for oxathiapiprolin as toxicity endpoints were equal to or greater than that of the technical active ingredient (Table 12, Appendix I).

Oxathiapiprolin does not pose a risk to bees for uses at rates of up to  $3 \times 120 \text{ g a.i./ha}$  ( $360 \text{ g a.i./ha}$  per season based on an available semi-field study where bees were allowed to actively forage on residues following multiple applications of the compound, including one foliar application at full bloom while bees were foraging). Therefore, all proposed foliar application rates at  $4 \times 35 \text{ g a.i./ha}$  ( $140 \text{ g a.i./ha}$  per season) pose a negligible risk to honeybees. Slight effects on the mortality of pupae and young honeybees in the hive were observed at the highest rate of  $3 \times 180 \text{ g a.i./ha}$  ( $540 \text{ g a.i./ha}$  per season), which corresponds to the maximum seasonal rate of  $560 \text{ g a.i./ha}$  for soil applications to Crop Groups 8 and 9 (fruiting and cucurbit vegetables) and for foliar use on ginseng. These effects were not seen at either of the two lower rates (for example,  $3 \times 60 \text{ g a.i./ha}$  or  $3 \times 120 \text{ g a.i./ha}$ ), and there is no indication that the slight increase in pupal/young bee mortality at the high rate resulted in detectable effects to colony development (including colony health, hive strength and total number of brood). In addition, the slight increase in mortality of young bees occurred primarily during the first 7 days post foliar application, with evidence of recovery in the remaining 18 day observation period. Therefore, the use of oxathiapiprolin at rates up to  $560 \text{ g a.i./ha}$  per season is not expected to pose a risk to honeybee colony health for the following reasons: 1) although statistically higher than controls, the observed mortality of pupae/young bees in the study hives at seasonal rate of  $540 \text{ g a.i./ha}$  was low, 2) overall colony health, hive strength and number of brood were not significantly affected, 3) crops receiving soil applications only will not have foliar surface residues during flowering, as occurred in the semi-field trial, and 4) ginseng (the only foliar-applied crop at this high rate) is not highly attractive to bees. Therefore, mitigation will not be required on the product labels.

## Birds and mammals

Oxathiapiprolin and the formulation product Oxathiapiprolin 100 g/L OD are practically non-toxic to Northern bobwhite quail (*Colinus virginianus*), mallard duck (*Anas platyrhynchos*) and Zebra finch (*Poephila guttata*) on both an acute oral and acute dietary exposure basis (oral  $LD_{50}$  values  $>2250 \text{ mg a.i./kg bw}$  and dietary  $LD_{50}$  values  $>1280 \text{ mg a.i./kg bw/d}$ ). Chronic exposure to oxathiapiprolin resulted in no treatment-related adverse effects on reproductive parameters or on the parental generation for Northern bobwhite quail up to the highest test concentration, with a resulting NOEC of  $1200 \text{ mg a.i./kg diet}$  (NOEL =  $156.3 \text{ mg a.i./kg bw/d}$ ). For mallard duck, significant reductions in hatchability and subsequent impacts on the number of 14 day old survivors were observed at the highest treatment level. The resulting NOEC was  $920 \text{ mg a.i./kg diet}$  (NOEL =  $117.4 \text{ mg a.i./kg bw/d}$ ).

Based on the available data, oxathiapiprolin is practically non-toxic to small mammals (rats) on an acute oral basis with the most sensitive LD<sub>50</sub> of >5000 mg a.i./kg bw. In a rat two-generation reproduction study, the most sensitive effects were decreased body weights and body-weight gains in F2 pups at 1195.6 mg a.i./kg bw/day, resulting in an offspring NOAEL of 411.4 mg a.i./kg/day.

Birds and mammals may be exposed to oxathiapiprolin following the ingestion of plant materials and insects sprayed with oxathiapiprolin during foliar application or ingestion of insects exposed to oxathiapiprolin during soil application. The screening level risk assessment for Oxathiapiprolin 100 g/L OD is conducted for direct on-field exposure at the maximum proposed application rate of 2 × 280 g a.i./ha, assuming exposure occurs entirely through the consumption of food sources contaminated with oxathiapiprolin at the maximum nomogram residue levels, the most conservative scenario.

The screening level risk assessment shows that for the worst case exposure scenario RQs for acute adverse effects and reproductive effects are below the level of concern for all sizes of birds and mammals.

#### **Non-target terrestrial vascular plants**

The toxic effects of oxathiapiprolin on vegetative vigour and seedling emergence of terrestrial vascular plants were tested at the maximum nominal application rate of 600 g a.i./ha using the oxathiapiprolin 100 g/L OD formulation. Inhibition of survival, shoot length and shoot dry weight did not exceed 25% in any of the six dicotyledonous and four monocotyledonous species tested in either the seedling emergence or vegetative vigor studies.

A screening level assessment was conducted for the 100 g/L OD formulation using the on-field EECs based on the maximum application rates of 2 × 280 g a.i./ha and a mean measured ER<sub>25</sub> of >584 g a.i./ha for seedling emergence and >629 g a.i./ha for vegetative vigour. Screening level risk quotients were below the level of concern for oxathiapiprolin exposure to terrestrial vascular plants for both seedling emergence and vegetative vigor effects.

#### **4.2.2 Risks to Aquatic Organisms**

Aquatic organisms can be exposed to oxathiapiprolin as a result of spray drift and runoff. To assess the potential for adverse effects, screening level EECs in the aquatic environment were calculated based on a direct application of 2 × 280 g a.i./ha at a 7 day interval and an aquatic whole-system representative half-life (t<sub>R</sub>) of 229 days at 20°C to a 15-cm deep water body representing a seasonal pond suitable for amphibians and an 80-cm deep water body representing a permanent pond. Oxathiapiprolin was assumed to be instantaneously and completely mixed within the water body. The resulting EECs were 0.369 mg a.i./L for a water body of 15 cm in depth and 0.0693 mg a.i./L for a water body of 80 cm in depth (Table 10, Appendix I).

A risk assessment of oxathiapiprolin, the end use product oxathiapiprolin 100 g/L OD and the major and minor oxathiapiprolin transformation products observed in water and soil biotransformation studies was undertaken for freshwater and marine aquatic organisms based on

available toxicity data. A summary of aquatic toxicity data for oxathiapiprolin is presented in Table 14, Appendix I. When calculating RQ values, acute toxicity endpoints ( $E_rC_{50}$  and  $LC_{50}$ ) are divided by an uncertainty factor of 2 for aquatic plants and invertebrates and 10 for fish species. No uncertainty factors are applied to chronic NOEC endpoints. The accompanying risk assessment is presented in Tables 23 to 25.

### **Algae and plants**

For freshwater species: Acute toxicity testing with freshwater algae (*Pseudokirchneriella subcapitata*) was performed for oxathiapiprolin, oxathiapiprolin 100 g/L OD and several minor and major transformation products. Toxicity to the blue-green alga *Anabaena flos-aquae* and the diatom *Navicula pelliculosa* was also determined for oxathiapiprolin. Statistically significant ( $p < 0.05$ ) effects on the biomass or growth rate of *P. subcapitata* was observed for oxathiapiprolin 100 g/L OD and several of the aquatic transformation products. For all tests however, the  $EC_{50}$  values were determined to be greater than the highest achievable test concentrations, with the exception of the transformation product IN-QPS10. For IN-QPS10, significant reductions in yield  $> 50\%$  were observed ( $E_yC_{50} = 0.814$  mg/L).

The levels where toxic effects were observed exceeded the maximum proposed application rates and as a result, all screening level risk quotients for oxathiapiprolin and its transformation products were below the level of concern for freshwater algae.

Acute toxicity to aquatic vascular plant duckweed (*Lemna gibba*) was determined for oxathiapiprolin in a static system. No statistically significant ( $p < 0.05$ ) inhibition on the growth rate or biomass of *L. gibba* was observed up to the highest test concentration. The  $EC_{50}$  was determined to be  $> 0.790$  mg a.i./L.

The screening level risk quotient for oxathiapiprolin exposure was below the level of concern for freshwater plants.

For estuarine/marine species: Acute toxicity to the saltwater diatom (*Skeletonema costatum*) was determined for oxathiapiprolin in a static system. No significant effects on biomass or growth rate were found up to the highest test concentration ( $EC_{50} > 0.460$  mg a.i./L).

The screening level risk quotient for oxathiapiprolin exposure was below the level of concern for marine algae.

### **Aquatic invertebrates**

For freshwater species: Both acute and chronic tests on aquatic invertebrates, including *Daphnia magna* (water dwelling) and chironomus (sediment dwelling) were performed for oxathiapiprolin, oxathiapiprolin 100 g/L OD and several minor and major transformation products.

*Daphnia magna*: In the acute toxicity test on *D. magna*, significant mortality/immobility was observed following 48 hours of exposure to oxathiapiprolin at the highest test concentration. The resulting EC<sub>50</sub> value was 0.629 mg a.i./L. For oxathiapiprolin 100 g/L OD and most transformation products, acute EC<sub>50</sub> values were greater than the highest achievable test concentrations. For the transformation products IN-QFD61 and IN-QPS10, significant mortality above 50% was observed, with EC<sub>50</sub> values of 5.14 and 14.7 mg/L, respectively. When *D. magna* was exposed to oxathiapiprolin on a chronic basis, no treatment-related effects on survival, reproduction or growth were observed up to the highest test concentration (NOEC = 0.750 mg a.i./L).

The levels where toxic effects were observed exceeded the maximum proposed application rates and as a result, all acute and chronic screening level risk quotients for *Daphnia magna* were below the level of concern for oxathiapiprolin and its aquatic transformation products.

*Chironomus*: In the acute toxicity test on larvae of the midge (*Chironomus riparius*), no mortality or sublethal effects were observed following 48 hours of exposure to oxathiapiprolin (EC<sub>50</sub> > 0.56 mg a.i./L). When *C. riparius* was exposed to oxathiapiprolin via spiked sediments in a static water-sediment system on a chronic basis, statistically significant effects on emergence rate and development rate were observed ( $p < 0.05$ ). The NOEC for emergence rate (the most sensitive endpoint) was determined to be 0.17 mg a.i./L based on time-weighted average concentrations in overlying water. When exposed to oxathiapiprolin via spiked water in a static water-sediment system on a chronic basis, statistically significant effects on emergence rate were observed ( $p < 0.05$ ; NOEC = 0.099 mg a.i./L based on time-weighted average concentrations in overlying water). Chronic exposure to the transformation product IN-Q7D41 via spiked water in a static water-sediment system resulted in statistically significant effects on development rate ( $p < 0.05$ ; NOEC = 0.14 mg a.i./L based on time-weighted average concentrations in overlying water).

Acute and chronic screening level risk quotients for exposure of oxathiapiprolin and IN-Q7D41 in overlying water to the sediment-dwelling invertebrate *Chironomus riparius*, were below the level of concern.

For estuarine/marine species: Acute exposure to Eastern oysters (*Crassostrea virginica*) and mysid shrimp (*Americamysis bahia*) did not result in reduction in shell growth (oysters) or mortality (mysids) above 50% of control levels at concentrations up to highest achievable test concentrations of oxathiapiprolin (EC<sub>50</sub> values >0.330 mg a.i./L and >0.640 mg a.i./L, respectively, based on mean measured concentrations. Chronic exposure to *A. bahia* over its life cycle however, resulted in significant reductions in number of young produced per female ( $p < 0.05$ ; NOEC = 0.058 mg a.i./L based on mean measured concentrations).

The risk to benthic and pelagic marine invertebrates was assessed for oxathiapiprolin exposure to oysters and mysid crustaceans, respectively. Screening level risk quotients for acute exposure to oxathiapiprolin did not exceed the level of concern for marine invertebrates. Chronic exposure to mysids marginally exceeds the level of concern (RQ = 1.19), based on observed reductions in reproduction above this level of exposure. Chronic risk from oxathiapiprolin exposure however, is unlikely in the marine environment given the slight exceedence of the level of concern and the

conservative assumption that mysids are exposed on a chronic basis to all oxathiapiprolin entering the water column, given the partitioning properties to sediments and the higher rates of water exchange in estuarine environments. Therefore oxathiapiprolin is not expected to pose a chronic risk to marine invertebrates.

## **Fish**

For freshwater species: Acute toxicity of oxathiapiprolin, oxathiapiprolin 100 g/L OD and several transformation products to fish was determined with for rainbow trout (*Oncorhynchus mykiss*), representing a cold water species, and the acute toxicity of oxathiapiprolin was determined for fathead minnow (*Pimephales promelas*), a warm water species. Chronic toxicity of oxathiapiprolin to fish was determined in an Early-Life-Stage (ELS) test with rainbow trout.

Following 96 hours of exposure to oxathiapiprolin or oxathiapiprolin 100 g/L OD, there were no mortalities observed at any test concentration for both fish species. In all cases, the acute LC<sub>50</sub> was greater than the highest achievable mean-measured concentrations. For rainbow trout exposed to oxathiapiprolin 100 g/L OD, fish were lethargic at the two highest concentrations for the first 48 hours, but all fish appeared normal after 72 - 96 hours. Of the transformation products tested, only IN-QPS10 had significant mortality (LC<sub>50</sub> = 6.96 mg/L), but otherwise no transformation products exhibited mortality or sublethal effects up to the highest concentrations tested.

In the chronic ELS test with fathead minnow, no biologically significant effects were observed on hatchability, time to hatch or larval survival. However, there was a statistically significant decrease in growth (length and weight) on Day 60 post-hatch, which occurred at the highest test concentration ( $p < 0.05$ ). The NOEC was determined to be 0.46 mg a.i./L. In addition, no statistically significant morphological and behavioural effects were observed.

Screening level acute and chronic risk quotients for both species of fish were below the level of concern. The acute risk quotient for rainbow trout from exposure of the end use product oxathiapiprolin 100 g/L OD formulation of  $< 1.36$  may slightly exceed the level of concern based on an LC<sub>50</sub> value above the highest achievable test concentration for oxathiapiprolin. However, the end use product is not expected to pose an acute risk to rainbow trout given the lack of mortality in the study up to the highest test concentration and the lack of toxicity to rainbow trout and bluegill sunfish from the technical active ingredient.

The acute risk of major and minor oxathiapiprolin transformation products observed in water and soil biotransformation studies were also assessed for rainbow trout. Of the transformation products assessed, only IN-Q7D41 showed a potential risk based on an LC<sub>50</sub> endpoint greater than the highest achievable test concentration (i.e., RQ  $< 3.83$ ). The screening level EEC for IN-Q7D41 is based on the overly conservative assumption that all available oxathiapiprolin in the water converted directly to IN-Q7D41. However, in the laboratory aerobic aquatic degradation study (PMRA document number 2364772), the maximum amount of IN-Q7D41 formed in the water column was  $\leq 1.5\%$  of applied oxathiapiprolin. Based on this level of exposure, the revised risk quotient for IN-Q7D41 of  $< 0.1$  is below the level of concern. Therefore, oxathiapiprolin transformation products are not expected to pose a risk to freshwater fish.

For estuarine/marine species: Acute and chronic toxicity of oxathiapiprolin to marine/estuarine fish was determined with saltwater sheepshead minnow (*Cyprinodon variegatus*). The acute test on sheepshead minnows showed that oxathiapiprolin did not cause mortality or sublethal behavioural effects following 96 hours of exposure. The LC<sub>50</sub> was >0.65 mg a.i./L, the highest concentration tested. In the chronic ELS study with sheepshead minnow, there were no treatment-related effects indicated at any level on hatching success, time to hatch, post-hatch survival, wet weight, or length. In addition, there were no treatment-related clinical signs of toxicity. There was however, a significant reduction in growth based on fish dry weight ( $p < 0.05$ , NOEC = 0.23 mg a.i./L).

The acute risk quotient for sheepshead minnow was < 1.07 in an 80-cm deep marine water body based on an LC<sub>50</sub> value > 0.65 mg a.i./L. Given that no mortality was observed in the sheepshead minnow up to 0.65 mg a.i./L, oxathiapiprolin is not expected to pose an acute risk to marine fish. In addition, the level of concern was not exceeded for marine fish from chronic exposure oxathiapiprolin. Therefore, marine fish are not expected to be at risk from oxathiapiprolin up to the highest use rate of 560 g a.i./ha per season.

## **Amphibians**

The risk to amphibians was determined using acute and chronic toxicity data for rainbow trout as a surrogate species. The risk quotient for acute exposure for amphibians in 15 cm water was <5.35; however, there is uncertainty as to whether the level of concern was exceeded as there was no mortality for rainbow trout up to 0.69 mg a.i./L and the LC<sub>50</sub> was therefore > 0.69 mg a.i./L. Oxathiapiprolin is not expected to pose a risk to amphibians on a chronic basis as the level of concern was not exceeded using the chronic fish ELS endpoint as a surrogate for amphibians in 15 cm water (RQ = 0.8).

Tier I refinement: The potential for acute risk to amphibians was refined by assessing the risk for foliar applications at the lower rate of 140 g a.i./ha per season, and by further characterizing low and high-rate EECs for adjacent off-field aquatic habitats based on input from spray drift. A separate assessment for runoff was not conducted given the slight exceedance of the level of concern based on an acute toxicity endpoint for rainbow trout that did not result in any mortality or sublethal toxicity up to the achievable solubility limit in the study and due to the lack of chronic risk to amphibians.

Estimated environmental concentrations for the lower foliar application rate of 140 g a.i./ha per season were also determined for amphibian habitats to determine if the level of concern was exceeded for all other foliar applications except ginseng (Table 23, Appendix I). The resulting RQ of < 1.3 for amphibians exposed to oxathiapiprolin at the lower application rate of 140 g a.i./ha may still marginally exceed the level of concern, although there is uncertainty as the endpoint is based on no effects up the highest test concentration.

Refined EECs for spray drift considered field sprayer applications at both the low rate for foliar use on all field crops except ginseng at rates up to 140 g a.i./ha per season, and for ginseng at rates up to 560 g a.i./ha per season, taking into account an 11% drift deposition factor for ASAE fine field sprayer applications to water bodies 1 m downwind of the site of application (Table 24, Appendix I).

Refined risk quotients for acute exposure of oxathiapiprolin spray drift do not exceed the level of concern for amphibians for foliar applications up to 560 g a.i./ha.

#### **4.2.3 Environmental Incident Reports**

No incident reports were available. This is a new active ingredient and incident reports are not expected.

## **5.0 Value**

### **5.1 Consideration of Benefits**

Diseases caused by oomycete fungi can infect all plant parts, including the marketable parts. A decrease in the quality of fruit can have a significant impact on revenue. Some commodities have very low tolerance for damage, which can result in unmarketable fruit or significantly downgrade its value. The economic benefit of oxathiapiprolin was confirmed in multiple efficacy trials by significantly increasing the yield and/or quality of major commodities grown in Canada.

Oxathiapiprolin is compatible with current integrated pest management (IPM) practices and introduces a new mode of action that is effective against oomycetes. In addition, registration of these fungicide products will allow growers access to products that will address several priority diseases in Canada.

Resistance development has been a problem in certain diseases caused by oomycetes, such as cucumber downy mildew. For phytophthora diseases, oxathiapiprolin used as a soil drench will reduce soil inoculum, which provides early protection that can delay infection and reduce the severity of an epidemic. Alternative fungicides with different modes of action are registered for the control or suppression of the proposed diseases on most of the proposed crops. For those crops with limited alternatives, a new mode of action fungicide may extend disease control when introduced to a spray program as a rotational product. The addition of oxathiapiprolin to a disease management plan for all of the proposed crops also provides a rotational product to help delay of the development of resistance. Please refer to Appendix I, Table 26, for more information on alternative products.

Oxathiapiprolin has a unique mode of action that is currently classified by the Fungicide Resistance Action Committee (FRAC) as a group U15 fungicide. Although FRAC has not yet issued resistance management use recommendations for this active ingredient, the registrant has provided their own recommendations in order to maintain the sustainability of oxathiapiprolin. Recommendations include a maximum of two sequential applications before rotating to a different mode of action and limiting the number of seasonal applications to 1/3 of the total foliar or soil applications.

## **5.2 Effectiveness Against Pests – Dupont Zorvec Enicade Fungicide**

Dupont Zorvec Enicade Fungicide is the oil dispersion (OD) formulation of oxathiapiprolin.

### **5.2.1 Downy mildew (*Peronospora* spp., *Pseudoperonospora cubensis*, *Bremia lactucae*)**

#### **Blue mould (*Peronospora tabacina*)**

Control of downy mildew was proposed for Crop Group 3 (Bulb Vegetables), Crop Group 4 (Leafy Vegetables), Crop Group 5A (Head and Stem Brassica Vegetables), Crop Group 9 (Cucurbit Vegetables), and succulent pea. Blue mould on tobacco is caused by a related pathogen and so is included in this summary. Oxathiapiprolin is to be applied to foliage at rates between 8.75 and 35 g a.i./ha. Twenty efficacy trials conducted between 2009 and 2012 and a scientific rationale were submitted to support the claims.

Oxathiapiprolin demonstrated commercially acceptable levels of control against multiple downy mildew pathogens affecting the labelled crops. The claims were extrapolated to other crops affected by the tested pathogens and to greenhouse tomato, pepper and cucumber. Data generated on onion, spinach, cucurbit crops and tobacco was extrapolated to support a related pathogen affecting succulent pea. The reviewed value information was sufficient to support the claims of control of downy mildew on the indicated crops at the proposed rates and timing.

### **5.2.2 Diseases incited by *Phytophthora* spp.**

*Phytophthora* spp. are aggressive pathogens that incite foliar, crown, and root diseases on many crops. Claims of control of phytophthora blight, late blight and/or root rot were proposed for Crop Group 9 (Cucurbit Vegetables), potato, tomato, pepper, eggplant and ginseng. Oxathiapiprolin is to be applied to foliage at rates between 8.75 and 35 g a.i./ha except for ginseng (70 – 280 g a.i./ha) or as a soil drench at rates of 70 – 280 g a.i./ha. A total of 21 efficacy trials conducted between 2009 and 2011 were submitted to support the claims; nine trials were submitted on phytophthora blight, 10 trials were submitted on late blight, and two trials were submitted on root rot. Foliar, drench and chemigation (via drip irrigation) application methods were tested in the trials.

Commercially acceptable control was demonstrated in the trials against the labelled diseases using the tested application methods. The claims were extrapolated to other crops affected by the tested pathogens and to greenhouse tomato, pepper and cucumber. The reviewed value information was sufficient to support the claims of control of phytophthora blight on Crop Group; 9 tomato, pepper, and eggplant; control of late blight on potato, tomato, pepper and eggplant, and control of foliar blight and root rot on ginseng. The use patterns were supported at the proposed rates and timings.

### **5.2.3 Comparison of OD and SC formulations, Extrapolation to Dupont Zorvec Epicaltrin Fungicide**

Dupont Zorvec Epicaltrin Fungicide is the suspension concentrate (SC) formulation of oxathiapiprolin. Dupont Zorvec Epicaltrin Fungicide is intended as a soil-applied product to control the soil phase of phytophthora blight on Cucurbit Vegetables, tomato, pepper and eggplant.

Bridging trials were conducted to demonstrate comparable efficacy between the OD (oil dispersion) and SC formulations. Five trials conducted on cucurbit crops, tomato and pepper tested the two formulations as side-by-side treatments using foliar and chemigation via drip irrigation application methods. Comparable efficacy was observed in all trials; therefore, the two formulations are considered biologically equivalent. As such, the uses proposed for the Epicaltrin Fungicide label were extrapolated from data reviewed in support of Dupont Enicade Fungicide.

### **5.2.4 Extrapolation to Orondis Fungicide and OXTP 200SC Fungicide**

Orondis Fungicide and OXTP 200SC Fungicide are biologically equivalent to Dupont Zorvec Enicade Fungicide and Dupont Zorvec Epicaltrin Fungicide respectively. All uses supported for Dupont Zorvec Enicade Fungicide and Dupont Zorvec Epicaltrin Fungicide were extrapolated to Orondis Fungicide and OXTP 200SC Fungicide respectively.

### **5.2.5 Additional application methods**

The submitted information demonstrated the value of treatment of crops with oxathiapiprolin to control downy mildew and phytophthora diseases on multiple crops using foliar application, soil drench application and chemigation through drip irrigation equipment. Other application methods proposed include in-furrow treatments or application via transplant water (injected into planting hole when transplanting). A comparison of the solution rates and application methods to the tested methods revealed comparable application rates between all techniques. Based on the value of the application methods and the prescriptive application directions ensuring proper application rates, in-furrow application and application via transplant water were supported.

## **5.3 Non-Safety Adverse Effects**

No phytotoxic effects were observed in any trial as a result of treatment with either formulation of oxathiapiprolin.

## 5.4 Supported Uses

All of the proposed use claims were supported for registration by the submitted value information. Certain crop groups were amended based on the potential of certain crops to be grown commercially in Canada or their susceptibility to the disease and pathogen. The interval for one crop group was amended to reflect the use pattern tested in efficacy trials. See Table 27, Appendix I, for a summary of the supported uses.

## 6.0 Pest Control Product Policy Considerations

### 6.1 Toxic Substances Management Policy Considerations

The Toxic Substances Management Policy (TSMP) is a federal government policy developed to provide direction on the management of substances of concern that are released into the environment. The TSMP calls for the virtual elimination of Track 1 substances [those that meet all four criteria outlined in the policy, for example, persistent (in air, soil, water and/or sediment), bio-accumulative, primarily a result of human activity and toxic as defined by the *Canadian Environmental Protection Act*].

During the review process, oxathiapiprolin and its major transformation products were assessed in accordance with the PMRA Regulatory Directive DIR99-03<sup>5</sup> and evaluated against the Track 1 criteria. The PMRA has reached the following conclusions:

- Oxathiapiprolin does not meet all Track 1 criteria, and is not considered a Track 1 substance. See Table 25, Appendix I for comparison with Track 1 criteria.
- Transformation products of oxathiapiprolin do not meet all Track 1 criteria based on log  $K_{ow}$  values below the Track 1 criterion for bioaccumulation. See Table 25, Appendix I for comparison with Track 1 criteria.

### 6.2 Formulants and Contaminants of Health or Environmental Concern

During the review process, contaminants in the technical and formulants and contaminants in the end-use products are compared against the *List of Pest control Product Formulants and Contaminants of Health or Environmental Concern* maintained in the *Canada Gazette*<sup>6</sup>. The list

---

<sup>5</sup> DIR99-03, *The Pest Management Regulatory Agency's Strategy for Implementing the Toxic Substances Management Policy*

<sup>6</sup> *Canada Gazette*, Part II, Volume 139, Number 24, SI/2005-114 (2005-11-30) pages 2641–2643: *List of Pest Control Product Formulants and Contaminants of Health or Environmental Concern* and in the order amending this list in the *Canada Gazette*, Part II, Volume 142, Number 13, SI/2008-67 (2008-06-25) pages 1611-1613. *Part 1 Formulants of Health or Environmental Concern, Part 2 Formulants of Health or Environmental Concern that are Allergens Known to Cause Anaphylactic-Type Reactions and Part 3 Contaminants of Health or Environmental Concern.*

is used as described in the PMRA Notice of Intent NOI2005-01<sup>7</sup> and is based on existing policies and regulations including: DIR99-03; and DIR2006-02<sup>8</sup>, and taking into consideration the Ozone-depleting Substance Regulations, 1998, of the *Canadian Environmental Protection Act* (substances designated under the Montreal Protocol). The PMRA has reached the following conclusions:

- Based on the manufacturing process used, impurities of human health or environmental concern as identified in the Canada Gazette, Part II, Vol. 142, No. 13, SI/2008-67 (2008-06-25), including TSMP Track 1 substances and allergens known to cause anaphylactic-type reactions, are not expected to be present in the technical product oxathiapiprolin;
- Based on the formulating processes used, impurities of human health or environmental concern as identified in the Canada Gazette, Part II, Vol. 142, No. 13, SI/2008-67 (2008-06-25), including TSMP Track 1 substances and allergens known to cause anaphylactic-type reactions, are not expected to be present in the formulation products DuPont Enicade Fungicide, Orondis Fungicide, or DuPont Zorvec Fungicide, OXTP 200SC Fungicide;
- The end-use product DuPont Enicade Fungicide, Orondis Fungicide, contains aromatic petroleum distillates which are toxic to aquatic organisms. An aromatic petroleum distillates hazard statement will be required on the end-use product label.

## 7.0 Summary

### 7.1 Human Health and Safety

The toxicology database submitted for oxathiapiprolin is adequate to define the majority of toxic effects that may result from exposure. Apart from offspring effects at the limit dose of testing in the rat 2-generation reproductive toxicity study, there were no significant toxicological effects in the database. There was no evidence of increased susceptibility of the young in the toxicity studies submitted. There was no evidence of carcinogenicity in mice or rats following longer-term dosing. The risk assessment protects against the toxic effects noted by ensuring that the level of human exposure is well below the lowest dose at which these effects occurred in animal tests.

Mixers, loaders and applicators handling DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide and workers re-entering treated fields and greenhouses are not expected to be exposed to levels of oxathiapiprolin that will result in health risks of concern when DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, or OXTP 200SC Fungicide are used according to label directions. The personal protective equipment on the product labels is adequate to protect workers while applying DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide,

---

<sup>7</sup> NOI2005-01, List of Pest Control Product Formulants and Contaminants of Health or Environmental Concern under the New Pest Control Products Act.

<sup>8</sup> DIR2006-02, *PMRA Formulants Policy*.

Orondis Fungicide, and OXTP 200SC Fungicide using backpack, manually-pressurized handwand or mechanically-pressurized handgun to greenhouse cucumbers, tomatoes, and peppers or when applying to bulb vegetables, brassica leafy vegetables, cucurbit vegetables, fruiting vegetables, leafy vegetables, ginseng, tobacco, succulent peas, and potatoes using groundboom, in-furrow or with chemigation.

Bystander exposure is not expected to result in health risks of concern when DuPont Zorvec Enicade Fungicide, DuPont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide are used according to label directions.

The nature of the residues in plants and animals is adequately understood. The residue definition for enforcement is oxathiapiprolin in plant products and in animal matrices. The proposed use of oxathiapiprolin on potatoes, bulb vegetables, leafy vegetables, head and stem *Brassica* vegetables, tomato, pepper, eggplant, cucurbit vegetables, ginseng and succulent peas does not constitute a risk of concern for chronic dietary exposure (food and drinking water) to any segment of the population, including infants, children, adults and seniors. Sufficient crop residue data have been reviewed to recommend MRLs. The PMRA recommends that the following MRLs be specified for residues of oxathiapiprolin.

<b>Commodity</b>	<b>Recommended MRL (ppm)</b>
Leafy Greens (Crop Subgroup 4-13A)	15
Dried tomatoes	3.0
Green Onion (Crop Subgroup 3-07B)	2.0
<i>Brassica</i> Head and Stem Vegetables (Crop Group 5-13)	1.5
Edible-podded dwarf peas	1.0
Edible-podded peas	1.0
Edible-podded snow peas	1.0
Edible-podded sugar snap peas	1.0
Fruiting Vegetables (Crop Group 8-09)	0.5
Cucurbit Vegetables (Crop Group 9)	0.2
Ginseng roots	0.15
Succulent shelled English peas	0.05
Succulent shelled garden peas	0.05
Succulent shelled green peas	0.05
Succulent shelled peas	0.05
Bulb Onion (Crop Subgroup 3-07A)	0.04
Tuberous and Corm Vegetables (Crop Subgroup 1C)	0.01
Milk, fat, meat and meat byproducts of cattle, goats, horses, hogs and sheep	0.01

## **7.2 Environmental Risk**

Oxathiapiprolin is moderately persistent to persistent in the terrestrial environment and moderately persistent in the aquatic environment. Oxathiapiprolin residues in soil may carry over to the following growing season. Oxathiapiprolin is relatively immobile in soil and has a limited

potential to leach to groundwater. It may enter aquatic environments through spray drift or surface runoff. In aquatic environments, oxathiapiprolin will move from the water to the sediments. Oxathiapiprolin may pose a risk to non-target amphibians at the proposed use rates. When applied as a foliar spray at 560 g a.i./ha it may also pose a risk to beneficial arthropods living within the treated field. Foliar applications of oxathiapiprolin at the lower rate of 140 g a.i./ha per season are not expected to pose a risk to non-target terrestrial organisms. The identified risks can be mitigated with spray buffer zones to protect sensitive amphibian habitats from spray drift and through the use of label statements to inform and instruct users regarding potential risks to aquatic organisms, beneficial arthropods, and to the environment.

### **7.3 Value**

The value information submitted to register four end-use products containing oxathiapiprolin were sufficient to demonstrate their value in pest management for various crops. Oxathiapiprolin is a new mode of action fungicide effective against oomycete pathogens. The registration of oxathiapiprolin products addresses several disease priorities identified by growers. These new products may be integrated into an IPM program with cultural methods and other fungicides to control important diseases and contribute to agricultural sustainability through resistance management.

## **8.0 Proposed Regulatory Decision**

Health Canada's PMRA, under the authority of the *Pest Control Products Act* and Regulations, is proposing full registration for the sale and use of DuPont Zorvec Technical Fungicide, Dupont Zorvec Enicade Fungicide, Dupont Zorvec Epicaltrin Fungicide, Orondis Fungicide, and OXTP 200SC Fungicide, containing the technical grade active ingredient oxathiapiprolin, for use against selective oomycete diseases on bulb vegetables, brassica (cole) leafy vegetables, cucurbit vegetables, fruiting vegetables, leafy vegetables, ginseng, tobacco, peas, and potatoes.

An evaluation of available scientific information found that, under the approved conditions of use, the product has value and does not present an unacceptable risk to human health or the environment.

<b>Acute Toxicity Studies – OXTP 200SC Fungicide and Dupont Zorvec Epicaltrin</b>	
Acute Oral Toxicity (gavage)  Sprague Dawley rats  PMRA 2365221	LD <sub>50</sub> > 5000 mg/kg bw  <b>Low toxicity</b>
Acute Dermal Toxicity  Sprague Dawley rats  PMRA 2365223	LD <sub>50</sub> > 5000 mg/kg bw  <b>Low toxicity</b>
Acute Inhalation Toxicity  Sprague Dawley rats  PMRA 2365225	LC <sub>50</sub> > 5.1 mg/L  <b>Low toxicity</b>
Eye Irritation  NZW rabbits  PMRA 2365232	MAS = 0/110  <b>Non irritating</b>
Dermal Irritation  NZW rabbits  PMRA 2365230	MAS = 0/8  <b>Non irritating</b>
Skin Sensitization, Maximization  Hartley albino guinea pigs  PMRA 2365233	Very faint erythema in 9/20 test sites  <b>Not a potential skin sensitizer</b>

**Table 2 Toxicity Profile of Technical Oxathiapiprolin**

(Effects are known or assumed to occur in both sexes unless otherwise noted; sex specific effects are separated by semi-colons. Organ weight effects reflect both absolute organ weights and relative organ to bodyweights unless otherwise noted.)

Study Type/ Animal/ PMRA Document Number	Study Results
<b>Toxicokinetic Studies</b>	
<p>Metabolism and pharmacokinetics, gavage, PMRA document number: 2365155, 2365156 98.9% pure, radiolabeled on isoxazoline ring or the pyrazole ring 4-20 Sprague Dawley rats/sex/group, low dose = 10 mg/kg bw, high dose = 200 mg/kg bw</p> <p>Oxathiapiprolin and its metabolites were readily excreted by the rat with fecal excretion as the major route of elimination for all animals after low-and high-dose administration. Expiration as carbon dioxide or other volatile compounds was not a significant route of elimination. Retention of oxathiapiprolin or its metabolites in tissues and blood was negligible indicating very low potential for bioaccumulation. No individual tissue contained levels exceeding 0.04% of the dose by 168 hours after dose administration. In the low-dose groups (10 mg/kg bw), absorption was 31-49%. Absorption at the high dose (200 mg/kg bw) was saturated and averaged 5-8%.</p> <p>The metabolism of oxathiapiprolin involved multiple reaction sites including hydroxylation in various positions. The multiple reactions contributed too many identified and tentatively identified low level metabolites in feces, urine, and bile. Unmetabolized oxathiapiprolin was the chief component recovered in feces and accounted for 17-87% of the administered low-or high-dose of either label.</p> <p>Toxicokinetics and metabolism were also examined with multiple, repeat-doses of oxathiapiprolin for 14 days. Similarities between peak and minimum plasma and tissue concentrations across time following single doses suggest steady-state kinetic behaviour in male and female rats. After cessation of dosing, the <sup>14</sup>C residues were readily eliminated from tissues and plasma. The overall tissue distribution in male and female rats was similar to that found after single dose administration and confirmed no accumulation in fat or muscle and very low potential for accumulation in liver, kidney and red blood cells. Excretion of parent oxathiapiprolin in the feces was the predominant route of elimination, with urinary elimination of cleaved metabolites playing a minor role.</p> <p>Metabolism of systemically absorbed dose was extensive and characterized by numerous identified and tentatively identified components in feces, urine and plasma. The material balance and profile of metabolites were consistent with that observed in the single dose study. Analysis of dose preparation and the liver for the two enantiomers of oxathiapiprolin, IN-Q7N25 ((S)-oxathiapiprolin) and IN-Q7N24 ((R)-oxathiapiprolin), showed that metabolism of IN-Q7N24 ((R)-oxathiapiprolin) was favoured three to fourfold over IN-Q7N25 ((S)-oxathiapiprolin). Radiolabel concentrations in tissue and plasma samples following single or multiple doses showed no significant potential for bioaccumulation of oxathiapiprolin or its metabolites.</p>

**Table 3 Toxicology Endpoints for Use in Health Risk Assessment for Oxathiapiprolin**

Exposure Scenario	Study	Point of Departure and Endpoint	CAF <sup>1</sup> or MOE
Acute dietary	No relevant endpoint identified		
Repeated dietary	Rat oral (dietary) 2-generation reproductive toxicity	NOAEL = 411 mg/kg bw/day Decreased offspring body weight, body-weight gain and increased time to preputial separation	100
	ADI = 4 mg/kg bw/day		
Short, intermediate and long-term dermal	No relevant endpoint identified		
Short and Intermediate-term inhalation	Rat oral (dietary) 2-generation reproductive toxicity	Adjusted NOAEL <sup>2</sup> = 20 mg/kg bw/day Decreased offspring body weight, body weight gain and increased time to preputial separation	100
Cancer	No relevant endpoint identified		

<sup>1</sup> CAF (composite assessment factor) refers to a total of uncertainty and PEST CONTROL PRODUCTS ACT factors for dietary risk assessment; MOE refers to the target margin of exposure for occupational assessment.

<sup>2</sup> Since GI absorption was only approximately 5% at high dose levels and compound absorption by the inhalation route is assumed to be 100%, the original oral NOAEL of 411 mg/kg bw/day was multiplied by a 5% correction factor to obtain a systemic NOAEL (411\*0.05=20) for inhalation exposure scenarios.

The primary metabolic pathways of oxathiapiprolin in rotational crops were cleavage between the piperidine and pyrazole rings, either in the crops or in the soil with metabolites translocated into crops, followed by further oxidation to form the pyrazole-containing polar metabolites, and subsequent glucose conjugation. Hydroxylation of oxathiapiprolin was also detected.				
<b>NATURE OF THE RESIDUE IN LAYING HEN</b>			<b>PMRA Document Number: 2365178</b>	
Two groups of laying hens (5 hens/group) were dosed orally with [pyrazole-5- <sup>14</sup> C] or [thiazole-5- <sup>14</sup> C]oxathiapiprolin by gelatin capsule at doses corresponding to 17.4-17.8 ppm in feed once daily for 14 days. Samples of excreta were collected daily. Samples of eggs were collected twice daily. The hens were euthanized 6 hours after administration of the final dose.

The primary metabolic pathways of oxathiapiprolin in poultry were hydroxylation in various positions of the molecule, and further oxidation to carboxylic acid. The oxidative cleavage of isoxazoline and/or piperidine rings were also observed.				
<b>NATURE OF THE RESIDUE IN LACTATING GOAT</b>			<b>PMRA Document Number: 2365176</b>	
One lactating goat per radiolabel was dosed orally with [pyrazole-5- <sup>14</sup> C] or [thiazole-5- <sup>14</sup> C]oxathiapiprolin by gelatin capsule at doses corresponding to 14.2-14.3 ppm in feed once daily for 7 days. Samples of excreta were collected daily. Milk was collected twice daily. The goats were euthanized 12 hours after administration of the final dose.

The metabolic fate of IN-SXS67, a plant metabolite of oxathiapiprolin, was investigated in ruminants. IN-SXS67 metabolised primarily to IN-E8S72. The total radioactive residues in the milk, muscle and fat were low.		

## Proposed Metabolic Pathways for Oxathiapiprolin

G: goat, H: hen, P: plants, R: rat

FREEZER STORAGE STABILITY			PMRA Document Number: 2364992							
Plant matrices (tomatoes, potato tubers, dry bean seed, soybean seed, grapes, grape dry pomace, wheat forage, straw and grain): Residues of oxathiapiprolin and metabolites IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 are stable for up to 18 months when crop samples are stored frozen at -20±10°C.										
CROP FIELD TRIALS & RESIDUE DECLINE ON POTATO			PMRA Document Number: 2364953							
Field trials were conducted in 2012 in Canada and the United States, in NAFTA Growing Regions 1 (3 trials), 2 (1 trial), 3 (1 trial), 5 (5 trials), 9 (1 trial), 10 (1 trial), 11 (7 trials), 12 (1 trial) and 14 (2 trials) for a total of 22 trials. DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 50 g a.i./ha/application for a seasonal application rate of 140-219 g a.i./ha. The applications were made at 5±1-day intervals with the last application occurring 4-5 days before harvest. An adjuvant was included in all spray mixes. <i>Residue decline:</i> Data were collected (0 to 14 days); since all oxathiapiprolin residues in/on potato tubers were <LOQ, decline behaviour could not be determined. <i>Metabolites:</i> Residues of IN-E8S72 and IN-WR791 in/on potato tubers were <LOQ following four applications at a total rate of 140-219 g a.i./ha and a PHI of 4-5 days. Potato tuber samples were not analysed for the other metabolites.										
Commodity	Total Application Rate (g a.i./ha)	PHI (days)	Oxathiapiprolin Residue Levels (ppm)							
			n	Min. #	Max. #	LAFT*	HAFT*	Median*	Mean*	SD*
Potato tubers	140-219	4-5	22	<0.01	<0.01	<0.01	<0.01	<0.01	<0.01	NA
# Values based on total number of samples. * Values based on per-trial averages. LAFT = Lowest Average Field Trial, HAFT = Highest Average Field Trial, SD = Standard Deviation. For computation of the LAFT, HAFT, median, mean and standard deviation, values < LOQ are assumed to be at the LOQ. n = number of field trials.										
CROP FIELD TRIALS & RESIDUE DECLINE ON DRY BULB ONIONS			PMRA Document Number: 2364949							
Field trials were conducted in 2011 and 2012 in Canada and the United States, in NAFTA Growing Regions 1 (1 trial), 5/5B (5 trials), 6 (1 trial), 10 (3 trials) and 11 (2 trials) for a total of 12 trials. DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 135-146 g a.i./ha. The applications were made at 5 day intervals with the last application occurring 0 or 4-6 days before harvest. An adjuvant was included in all spray mixes. <i>Residue decline:</i> Data were collected (0 to 14 days) and show that residues of oxathiapiprolin decreased in/on dry bulb onions with increasing PHIs. <i>Metabolites:</i> Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on dry bulb onions were <LOQ following four applications at a total rate of 135-146 g a.i./ha and a 0-day PHI.										
Commodity	Total Application Rate (g a.i./ha)	PHI (days)	Oxathiapiprolin Residue Levels (ppm)							
			n	Min. #	Max. #	LAFT*	HAFT*	Median*	Mean*	SD*

CROP FIELD TRIALS & RESIDUE DECLINE ON GREEN ONIONS			PMRA Document Number: 2364949							
Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 5/5B (2 trials), 6 (1 trial) and 10 (2 trials) for a total of 5 trials. DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 138-150 g a.i./ha. The applications were made at 5-day intervals with the last application occurring 0 or 4-6 days before harvest. An adjuvant was included in all spray mixes. <i>Residue decline:</i> Data were collected (0 to 14 days) and show that residues of oxathiapiprolin decreased in/on green onions with increasing PHIs. <i>Metabolites:</i> Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on green onions were <LOQ following four applications at a total rate of 138-150 g a.i./ha and a 0-day PHI.										

Commodity	Total Application Rate (g a.i./ha)	PHI (days)	Oxathiapiprolin Residue Levels (ppm)							
			n	Min.#	Max.#	LAFT*	HAFT*	Median*	Mean*	SD*
Green onion (whole plant)	138-150	0	5	0.38	0.86	0.40	0.85	0.57	0.58	0.18

# Values based on total number of samples.

\* Values based on per-trial averages. LAFT = Lowest Average Field Trial, HAFT = Highest Average Field Trial, SD = Standard Deviation. For computation of the LAFT, HAFT, median, mean and standard deviation, values < LOQ are assumed to be at the LOQ.

n = number of field trials.

#### CROP FIELD TRIALS & RESIDUE DECLINE ON LETTUCE

PMRA Document Number: 2364884 and 2364927

##### Foliar Application:

Field trials were conducted in 2011 and 2012 in Canada and the United States, in NAFTA Growing Regions 1 (1 trial), 2 (2 trials), 3 (1 trial), 5/5B (2 trials), 9 (1 trial), 10 (3 trials) and 11 (1 trial) for a total of 11 trials on head lettuce, and in NAFTA Growing Regions 2 (1 trial), 3 (1 trial), 5/5B (4 trials), 9 (1 trial), 10 (3 trials) and 11 (1 trial) for a total of 11 trials on leaf lettuce. DPX-QGU42 100 g/L OD formulation was applied three times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 140-149 g a.i./ha. The applications were made at 3±1-day intervals with the last application occurring 0 or 3 days before harvest. An adjuvant was included in all spray mixes.

*Residue decline:* Data were collected (0 to 23/27 days) and show that residues of oxathiapiprolin decreased in/on head and leaf lettuce with increasing PHIs.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on head and leaf lettuce were <LOQ following three applications at a total rate of 140-149 g a.i./ha and a 0-day PHI.

##### Soil Application:

Field trials were conducted in 2011 and 2012 in Canada and the United States, in NAFTA Growing Regions 1 (1 trial), 2 (2 trials), 3 (1 trial), 5/5B (2 trials), 9 (1 trial), 10 (3 trials) and 11 (1 trial) for a total of 11 trials on head lettuce, and in NAFTA Growing Regions 2 (1 trial), 3 (1 trial), 5/5B (4 trials), 9 (1 trial), 10 (3 trials) and 11 (1 trial) for a total of 11 trials on leaf lettuce. DPX-QGU42 100 g/L OD or 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 545-578 g a.i./ha. The applications were made at 7±1-day intervals with the last application occurring 0 or 3 days before harvest. Adjuvants were not included.

*Residue decline:* Data were collected (0 to 23/27 days) and show that residues of oxathiapiprolin decreased in/on head and leaf lettuce with increasing PHIs.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on head and leaf lettuce were <LOQ following two soil applications at a total rate of 545-578 g a.i./ha and a 0-day PHI.

##### Additional Soil Application Trials:

Three field trials were conducted in 2011/2012 in Canada and the United States in NAFTA Growing Regions 1, 5 and 10 on leaf lettuce. DPX-QGU42 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 556-560 g a.i./ha. The applications were made at 7±1-day intervals with the last application occurring between 0 and 70 days before harvest. Adjuvants were not included.

Commodity	Total Application Rate (g a.i./ha)	PHI (days)	Oxathiapiprolin Residue Levels (ppm)							
			n	Min.#	Max.#	LAFT*	HAFT*	Median*	Mean*	SD*
Head lettuce with wrapper leaves	140-149 (foliar)	0	11	0.20	1.5	0.23	1.4	0.57	0.67	0.40
	560-578 (soil)	0	11	<0.01	0.47	<0.01	0.43	0.01	0.08	0.16

<b>CROP FIELD TRIALS &amp; RESIDUE DECLINE ON TOMATOES</b>						<b>PMRA Document Number: 2364946 and 2364927</b>				
<p><u>Foliar Application:</u></p> <p>Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 1 (1 trial), 2 (1 trial), 3 (2 trials), 5 (8 trials) and 10 (7 trials) for a total of 19 trials (9 trials on small varieties and 10 on standard size varieties). DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 136-144 g a.i./ha. The applications were made at 5±1-day intervals with the last application occurring 0 or 5 days before harvest. An adjuvant was included in all spray mixes.</p> <p>Greenhouse trials were conducted in NAFTA Growing Regions 1 (2 trials) and 5 (2 trials) for a total of 4 trials (2 trials each on small and standard size varieties). DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 140-147 g a.i./ha. The applications were made at 5±1-day intervals with the last application occurring 0 days before harvest. An adjuvant was included in all spray mixes.</p> <p><i>Residue decline:</i> Data were collected (0 to 30 days) and show that residues of oxathiapiprolin decreased in/on tomatoes with increasing PHIs. In the greenhouse trials, residues of oxathiapiprolin increased at PHIs of 5 and 10 days, after which they began to decline.</p>										

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on tomatoes were <LOQ following four applications at a total rate of 136-147 g a.i./ha and a 0-day PHI.

**Soil Application:**

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 1 (1 trial), 2 (1 trial), 3 (2 trials), 5 (8 trials) and 10 (7 trials) for a total of 19 trials. DPX-QGU42 100 g/L OD or 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 554-611 g a.i./ha. The applications were made at 7±1-day intervals with the last application occurring 0 or 5 days before harvest. Adjuvants were not included.

*Residue decline:* Data were collected (0 to 30 days) and show that residues of oxathiapiprolin decreased in/on tomatoes with increasing PHIs.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on tomatoes were <LOQ following two soil applications at a total rate of 554-611 g a.i./ha and a 0-day PHI.

**Additional Soil Application Trials:**

Three field trials were conducted in 2011/2012 in Canada and the United States in NAFTA Growing Regions 1, 5 and 10 on tomatoes. DPX-QGU42 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 560-566 g a.i./ha. The applications were made at 7±1-day intervals with the last application occurring between 0 and 84 days before harvest. Adjuvants were not included.

**CROP FIELD TRIALS & RESIDUE DECLINE ON PEPPERS**

**PMRA Document Number: 2364930**

**Foliar Application:**

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 2 (2 trials), 3 (1 trial), 5 (4 trials), 6 (1 trial) and 10 (2 trials) for a total of 10 trials on bell peppers, and in NAFTA Growing Regions 2 (1 trial), 3 (1 trial), 5 (2 trials) and 9 (2 trials) for a total of 6 trials on nonbell peppers. DPX-QGU42 100 g/L OD formulation was applied three times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 140-156 g a.i./ha. The applications were made at 3±1-day intervals with the last application occurring 0 or 4-6 days before harvest. An adjuvant was included in all spray mixes.

Greenhouse trials were conducted in NAFTA Growing Regions 2 (1 trial) and 10 (1 trial) for a total of 2 trials on bell peppers. DPX-QGU42 100 g/L OD formulation was applied three times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 138-142 g a.i./ha. The applications were made at 2-3 day intervals with the last application occurring 0 or 4 days before harvest. An adjuvant was included in all spray mixes.

*Residue decline:* Data were collected (0 to 30/37 days) and show that residues of oxathiapiprolin decreased in/on nonbell and bell peppers with increasing PHIs. In the greenhouse trials, residues of oxathiapiprolin increased in one bell pepper trial, and declined in the other, at PHIs of 4 days.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on nonbell and bell peppers were ≤LOQ following three applications at a total rate of 140-156 g a.i./ha and a 0-day PHI.

**Soil Application:**

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 2 (2 trials), 3 (1 trial), 5 (4 trials), 6 (1 trial) and 10 (2 trials) for a total of 10 trials on bell peppers, and in NAFTA Growing Regions 2 (1 trial), 3 (1 trial), 5

(2 trials) and 9 (2 trials) for a total of 6 trials on nonbell peppers. DPX-QGU42 100 g/L OD or 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 546-665 g a.i./ha. The applications were made at 7±1-day intervals with the last application occurring 0 days before harvest. Adjuvants were not included.

*Residue decline:* Data were collected (0 to 27/28 days) and show that residues of oxathiapiprolin decreased in/on bell and nonbell peppers with increasing PHIs.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on nonbell and bell peppers were <LOQ following two soil applications at a total rate of 546-665 g a.i./ha and a 0-day PHI.

#### CROP FIELD TRIALS & RESIDUE DECLINE ON CUCUMBERS

PMRA Document Number: 2364899

##### Foliar Application:

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 2 (4 trials), 3 (1 trial), 5 (4 trials), 6 (2 trials) and 12 (1 trial) for a total of 12 trials on cucumbers. DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 136-143 g a.i./ha. The applications were made at 3-day intervals with the last application occurring 0 or 3 days before harvest. An adjuvant was included in all spray mixes.

A total of four greenhouse trials were conducted on cucumbers. DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 140-142 g a.i./ha. The applications were made at 3-day intervals with the last application occurring 0 or 3 days before harvest. An adjuvant was included in all spray mixes.

*Residue decline:* Data were collected (0 to 30 days) and show that residues of oxathiapiprolin decreased in/on cucumbers with increasing PHIs, both in the greenhouse and in the field trials.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on cucumbers were <LOQ following four applications at a total rate of 136-143 g a.i./ha and a 0-day PHI.

##### Soil Application:

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 2 (3 trials), 3 (1 trial), 5 (4 trials), 6 (2 trials) and 12 (1 trial) for a total of 11 trials on cucumbers. DPX-QGU42 100 g/L OD or 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 518-578 g a.i./ha. The applications were made at 7±1-day intervals with the last application occurring 0 or 3 days before harvest. Adjuvants were not included.

*Residue decline:* Data were collected (0 to 29 days) and show that, after an initial increase for up to 3 days, residues of oxathiapiprolin decreased in/on cucumbers with increasing PHIs.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on cucumbers were <LOQ following two soil applications at a total rate of 518-578 g a.i./ha and a 0-day PHI.

Commodity	Total Application Rate (g a.i./ha)	PHI (days)	Oxathiapiprolin Residue Levels (ppm)

#### CROP FIELD TRIALS & RESIDUE DECLINE ON SUMMER SQUASH

PMRA Document Number: 2364897 and 2364927

##### Foliar Application:

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 1 (1 trial), 2 (2 trials), 3 (1 trial), 5/5A (4 trials), 10 (1 trial) and 12 (1 trial) for a total of 10 trials on summer squash. DPX-QGU42 100 g/L OD formulation was applied four times as foliar broadcast sprays at a rate of approximately 35 g a.i./ha/application for a seasonal application rate of 138-149 g a.i./ha. The applications were made at 3-day intervals with the last application occurring 0 or 3 days before harvest. An adjuvant was included in all spray mixes.

*Residue decline:* Data were collected (0 to 28 days) and show that residues of oxathiapiprolin decreased in/on summer squash with increasing PHIs.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on summer squash were <LOQ following four applications at a total rate of 138-149 g a.i./ha and a 0-day PHI.

##### Soil Application:

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Regions 1 (1 trial), 2 (2 trials), 3 (1 trial), 5 (4 trials), 10 (1 trial) and 12 (1 trial) for a total of 10 trials on summer squash. DPX-QGU42 100 g/L OD or 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 557-578 g a.i./ha. The applications were made at 7-day intervals with the last application occurring 0 or 3 days before harvest. Adjuvants were not included.

*Residue decline:* Data were collected (0 to 30 days) and show that residues of oxathiapiprolin decreased in/on summer squash with increasing preharvest intervals (PHIs).

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on summer squash were <LOQ following two soil applications at a total rate of 557-578 g a.i./ha and a 0-day PHI.

##### Additional Soil Application Trials:

Three field trials were conducted in 2011/2012 in Canada and the United States in NAFTA Growing Regions 1, 5 and 10 on summer squash. DPX-QGU42 200 g/L SC formulation was applied two times as drip/drench/shank/basal in-season applications at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 560-566 g a.i./ha. The applications were made at 7±1-day intervals with the last application occurring between 0 and 84 days before harvest. Adjuvants were not included.

Commodity	Total Application Rate (g a.i./ha)	PHI (days)	Oxathiapiprolin Residue Levels (ppm)

<b>CROP FIELD TRIALS &amp; RESIDUE DECLINE ON GINSENG</b>	<b>PMRA Document Number: 2364875</b>
---	--------------------------------------

Field trials were conducted in 2011 in Canada and the United States, in NAFTA Growing Region 5 (4 trials). DPX-QGU42 100 g/L OD formulation was applied two times as foliar broadcast sprays at a rate of approximately 280 g a.i./ha/application for a seasonal application rate of 548-571 g a.i./ha. The applications were made at 15-day intervals with the last application occurring 13-14 days before harvest. At two sites, a second set of two applications were made 56-85 days later, for a total application rate of 1102-1125 g a.i./ha. Samples at these sites were also collected at PHIs of 13-14 days. An adjuvant was included in all spray mixes.

*Residue decline:* Data were collected (0 to 20 days), and showed an increase in residues of oxathiapiprolin in/on ginseng with increasing PHIs.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-E8S72, IN-RZB20, IN-RZD74, IN-SXS67 and IN-WR791 in/on ginseng were <LOQ a PHI of 13-14 days following two applications at a total rate of 548-571 g a.i./ha.

<b>RESIDUE DATA IN ROTATIONAL CROPS</b>	<b>PMRA Document Number: 2364840 and 2364838</b>
---	--

Three trials (two each for radish, cereals and soybeans) were conducted during the 2011/2012 growing seasons in NAFTA Growing Regions 1 (1 trial) and 5 (2 trials). DPX-QGU42 100 g/L OD formulation was applied to bare soil two times at a rate of either 140 or 280 g a.i./ha/application for a seasonal application rate of 275-282 or 544-565 g a.i./ha. The applications were made at 7-day intervals. Adjuvants were not included. The rotational crops were subsequently planted in treated soil at plantback intervals (PBIs) of 7-30, 60-120 and 300-365 days.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-RZB20, IN-RZD74 and IN-WR791 in/on all rotational crop commodities at all PBIs were <LOQ following two soil applications at a total rate of 275-282 or 544-565 g a.i./ha.

n = number of field trials.

Thirty-two trials (one for sorghum; two for mustard greens; three each for strawberries, lettuce, celery, soybeans and canola; four for sugar beets, five each for corn and wheat) were conducted during the 2012 growing seasons in NAFTA Growing Regions 2 (2 trials), 3 (1 trial), 4 (1 trial), 5 (12 trials), 7 (5 trials), 8 (1 trial), 10 (7 trials) and 14 (3 trials). DPX-QGU42 100 g/L OD formulation (or 200 g/L SC, in one wheat trial only) was applied to bare soil two times at a rate of 140 g a.i./ha/application for a seasonal application rate of 272-287 g a.i./ha. The applications were made at 7-day intervals. An adjuvant was included in all spray mixes. The rotational crops were subsequently planted in treated soil at plantback intervals (PBIs) of 5-10 days.

*Metabolites:* Residues of IN-Q7H09, IN-RDG40, IN-RZB20, IN-RZD74 and IN-WR791 (except an average residue of 0.012 ppm in wheat hay) in/on all rotational crop commodities at all PBIs were <LOQ following two soil applications at a total rate of 272-287 g a.i./ha.

n = number of field trials.

Based on the results of the confined crop rotation studies, field accumulation studies, and the toxicological profile of the active ingredient, plantback intervals are not required for the end-use products of oxathiapiprolin.

<b>PROCESSED FOOD AND FEED - POTATO</b>		<b>PMRA Document Number: 2364867</b>
<b>Test Site</b>	Three trials in NAFTA Growing Regions 1, 5 and 11	
<b>Treatment/Rate</b>	Seed-piece treatment or in-furrow at plant at 1400 g ai/ha + Early foliar broadcast at 1400 g ai/ha + 4x foliar broadcast at 175 g ai/ha/application with RTIs of 5 days

<b>LIVESTOCK FEEDING</b>		<b>PMRA Document Number: 2365372</b>
Based on the residue and metabolism data submitted, and the use pattern of the end-use products, residues of oxathiapiprolin in/on animal commodities are not expected. Thus, livestock feeding studies are not required. MRLs on animal commodities, except poultry, will be recommended at the LOQ of the enforcement method for animal matrices.

<sup>a</sup> Major transformation products are those occurring at greater than 10% applied radiation at any time, or near 10% and increasing at study conclusion.

<sup>b</sup> Environmental DT<sub>50s</sub> at a variety of northern latitudes (30 – 50°N)

<sup>c</sup> Carryover to the next growing season is based on the percentage of applied oxathiapiprolin present in the soil column approximately 365 days after application.

<sup>d</sup> Maximum depth of parent test material infiltration into soil at concentrations > L OD (0.3 - 0.5 µg/kg). No transformation products were observed below 70 cm depth in any of the field studies.

**Observed in:** Water-sediment systems (maximum 18.2% applied radiation)

**Table 9 Comparison of the properties of oxathiapiprolin and its major soil transformation products with the leaching criteria of Cohen et al. (1984).**

Property	Criteria of Cohen et al. (1984) indicating a potential for leaching	Meets criterion for leaching			
		Parent	IN-E8S72	IN-RAB06	IN-RDT31
Solubility in water	>30 mg/L	No	Yes	Yes	No
K <sub>d</sub>	<5 and usually <1 or 2	No	Yes	No	No
K <sub>oc</sub>	<300	No	Yes	No	No
Henry's law constant	<10 <sup>-2</sup> atm m <sup>3</sup> /mol	Yes	NA	NA	NA
pK <sub>a</sub>	Negatively charged (either fully or partially) at ambient pH	No	NA	NA	NA
Hydrolysis half-life	>20 weeks (>140 days)	Yes	NA	NA	NA
Soil photo-transformation half-life	>1 week (>7 days)	Yes	NA	NA	NA
Half-life in soil	>2 to 3 weeks (>14 to 21 days)	Yes	Yes	Yes for most soils tested	Yes

**Table 10 Estimated environmental concentrations (EECs) of oxathiapiprolin used for screening level risk assessment.**

Product	Application method	Maximum seasonal rate (g a.i./ha)	Terrestrial EEC		Aquatic EEC (mg a.i./L)	
			Soil exposure <sup>1</sup> (mg a.i./kg)	Foliar exposure <sup>2</sup> (g a.i./ha)	15 cm water <sup>3</sup>	80 cm water <sup>3</sup>
Oxathiapiprolin 100 g/L OD	Soil drench and foliar application (field sprayer)	2 × 280	0.246	452 (on vegetation) 554 (on soil)	0.369	0.0693

<sup>1</sup> Calculated based on a 7-day application interval, using the longest  $t_R$  in soil of 231 days and by assuming a soil bulk density of 1.5 g/cm<sup>3</sup> and a soil depth of 15 cm.

<sup>2</sup> Calculated using a foliar half-life of 10 days (on vegetation) or soil half-life of 231 days (on soil).

<sup>3</sup> Aquatic EECs are calculated by assuming oxathiapiprolin is applied direct overspray on water bodies of different depths and using the longest  $t_R$  of 229 days and a 7-day application interval.

<sup>4</sup> EECs for transformation products of oxathiapiprolin are presented in the appropriate risk assessment tables (Tables 16 and 23), along with the molecular weight ratios used to derive them from oxathiapiprolin EECs.

**Table 11 EECs in vegetation and insects after a direct over-spray as food sources for birds and small wild mammals.**

Environmental Compartment	fresh/dry weight ratios	Maximum residue concentration		Mean residue concentration	
		Concentration fresh weight (mg a.i./kg)	Concentration dry weight (mg a.i./kg)	Concentration fresh weight (mg a.i./kg)	Concentration dry weight (mg a.i./kg)
short range grass	3.3	96.8	319.5	34.4	113.5
leaves and leafy crops	11	54.7	602.1	18.1	199.0
long grass	4.4	44.3	195.1	14.5	63.7
forage crops	5.4	54.7	295.6	18.1	97.7
small insects	3.8	23.5	89.4	13.1	49.9
Pods with seeds	3.9	5.9	22.9	2.8	10.9
large insects	3.8	5.9	22.3	2.8	10.7
grain and seeds	3.8	5.9	22.3	2.8	10.7
fruit	7.6	5.9	44.7	2.8	21.3

Note: EECs are based on the highest rate for foliar application to ginseng (i.e., 2 × 280 g a.i./ha) with a 7-day interval and a foliar half-life of 10 days.

**Table 12 Estimated daily exposure (EDE) levels on-field for birds and mammals.**

<sup>a</sup> Food Ingestion Rates (Nagy, 1987). For generic birds with body weight less than or equal to 200 g, the “passerine” equation was used; for generic birds with body weight greater than 200 g, the “all birds” equation was used:

Passerine Equation (body weight < or =200 g):  $FIR (g \text{ dry weight/day}) = 0.398(BW \text{ in g})^{0.850}$

All birds Equation (body weight > 200 g):  $FIR (g \text{ dry weight/day}) = 0.648(BW \text{ in g})^{0.651}$ . For mammals, the “all birds” equation was used:  $FIR (g \text{ dry weight/day}) = 0.235(BW \text{ in g})^{0.822}$

<sup>b</sup> Large insects not considered to be a relevant food source for small birds and mammals.

<sup>c</sup> For granivorous species, only grains and seeds were considered as a relevant source of exposure (as opposed to seeds in pods, which were not considered).

<sup>d</sup> EDE = Estimated daily exposure is calculated using the following formula:  $(FIR/BW) \times EEC$ . At the screening level, food items representing the most conservative EEC are used.

<sup>e</sup> Additional food items that could be considered to further characterize the risk.

**Table 13 Effects of oxathiapiprolin technical, Oxathiapiprolin 100 g/L and 200 g/L SC formulations and the major transformation products on terrestrial organisms.**

Off-field	Field spray (11%)	49.7	0.43	<0.25	<0.25	No

<sup>1</sup>Based on toxicity studies conducted on glass plates.

**Table 17 Refinement of the risk to foliar-dwelling organisms from in-field and off-field exposure.**

Application scenario		EEC (g a.i./ha)	Tier I Refined RQ <sup>1</sup>	LOC exceeded?
			Parasitoid wasp <i>A. rhopalosiphi</i> 48h-LR <sub>50</sub> > 200 g a.i./ha	
In-field	Direct foliar application: 2×280 g a.i./ha, 7-d interval	452	<2.26	Yes <sup>2</sup>
Off-field	Field spray (11%)	49.7	<0.25	No

<sup>1</sup>Based on 48 hour extended toxicity study conducted on leaf surfaces.

<sup>2</sup>Uncertainty in whether LOC of 1.0 was exceeded as endpoint based on no-effects up to highest tested dose.

**Table 18 Details of results from field studies on predatory mites with Oxathiapiprolin 100 g/L OD.**

Study type	Exposure and endpoints
Field test (vineyards, Germany) – predatory mite population monitored (PMRA # 2364652)	<b>Application rate: 3 × 60 g a.i./ha (9-day interval):</b> The maximum reduction of the predatory mite population (100.0% <i>Typhlodromus pyri</i> ) when compared to the control was 20.4% at 6 DAA2 (31 days prior to study termination). LR <sub>50</sub> > 180 g a.i./ha
Field test (vineyards, France) – predatory mite population monitored (PMRA # 2364654)	<b>Application rate: 3 × 60 g a.i./ha (9 and 8 -day intervals):</b> The maximum reduction of the predatory mite population (97.8% <i>Typhlodromus pyri</i> and 2.2% <i>Amblyseius</i> sp.) when compared to the control was 11.9% at 30 DAA3 (study termination). LR <sub>50</sub> > 180 g a.i./ha
Field test (vineyards, Italy) – predatory mite population monitored (PMRA # 2364656)	<b>Application rate: 3 × 60 g a.i./ha (10-day interval):</b> The maximum reduction of the predatory mite population (100% <i>Kampimodromus aberrans</i> at last sampling) when compared to the control was 13.1% at 7 DAA1 (42 days prior to study termination). LR <sub>50</sub> > 180 g a.i./ha

**Table 19 Screening Level EECs and RQ values for honeybees based on foliar and soil drench applications.**

Exposure route	EEC (µg ai/g)	Exposure to bee (ug ai/bee/day)	Endpoint (µg ai/bee)	RQ	LOC exceeded?

Reproduction	411.40	Herbivore (short grass)	21.95	0.05	No
	411.40	Herbivore (leafy foliage)	41.37	0.10	No

<sup>a</sup> EDE = Estimated daily exposure; is calculated using the following formula: (FIR/BW) × EEC. Where FIR is Food Ingestion Rates (Nagy, 1987). For generic birds with body weight less than or equal to 200 g, the “passerine” equation was used; for generic birds with body weight greater than 200 g, the “all birds” equation was used:

Passerine Equation (body weight < or =200 g):  $FIR (g \text{ dry weight/day}) = 0.398(BW \text{ in g})^{0.850}$

All birds Equation (body weight > 200 g):  $FIR (g \text{ dry weight/day}) = 0.648(BW \text{ in g})^{0.651}$ .

For mammals, the “all mammals” equation was used:  $FIR (g \text{ dry weight/day}) = 0.235(BW \text{ in g})^{0.822}$

At the screening level, food items representing the most conservative EEC for each size guild are used.

<sup>a</sup>Risk is not expected for exposure to the end use product as no mortality was seen up to highest achievable test concentration with the technical grade active ingredient.

<sup>b</sup>Risk is not expected for exposure to this transformation product, as the EEC, corrected for observed amount of IN-Q7D41 in the water column of the aerobic water biotransformation study ( $\leq 1.5\%$  of applied oxathiapiprolin), results in a RQ <0.1.

<sup>c</sup>There is uncertainty in the potential for risk as there were no effects up to the highest achievable solubility of the chemical in the test system (i.e., the LC<sub>50</sub> was 3.7x greater than the limit of solubility for oxathiapiprolin in distilled water).

<sup>d</sup>Risk is not expected for chronic exposure to marine invertebrates given the marginal exceedence of the LOC of 1.0 and the conservative assumptions for marine exposure.

<sup>e</sup>Risk is not expected for acute exposure to marine fish due to the marginal exceedence of the LOC and as no mortality was observed in the study up to the highest achievable test concentration for the technical grade active ingredient.

<sup>f</sup>EECs for transformation products adjusted for molecular weight ratio relative to oxathiapiprolin: IN-E8S72 = (180.9/539.53), IN-QPS10 = (349.41/539.53), IN-RAB06 = (569.51/539.53), IN-RDT31 = (555.53/539.53), IN-P3X26 = (402.4/539.53), IN-Q7D41 = (537.13/539.53), IN-QFD61 = (400.4/539.53), IN-RSE01 = (542.53/539.53), IN-RYJ52 = (544.55/539.53), IN-S2K66 = (528.55/539.53), IN-S2K67 = (402.44/539.53).

			560 g a.i./ha	0.041	<0.59

**Table 25 Toxic Substances Management Policy Considerations-Comparison to TSMP Track 1 Criteria**

Toxic Substances Management Policy Considerations-Comparison to TSMP Track 1 Criteria							
TSMP Track 1 Criteria	TSMP Track 1 Criterion value		Active Ingredient	Major soil transformation products			
				IN-RAB06	IN-RDT31	IN-E8S72	IN-QPS10 <sup>5</sup>
CEPA toxic or CEPA toxic equivalent <sup>1</sup>	Yes		Yes	Yes	Yes	Yes	Yes
Predominantly anthropogenic <sup>2</sup>	Yes		Yes	Yes	Yes	Yes	Yes
Persistence <sup>3</sup> :	Soil	Half-life $\geq 182$ days	Yes <sup>6</sup> DT <sub>50</sub> : 16 – 134 days t <sub>1/2</sub> rep: 231 days (longest of six values)	Yes DT <sub>50</sub> : 3 – 201 days t <sub>1/2</sub> rep: 215 (longest of ten values)	Yes DT <sub>50</sub> : 50 – > 1000 days t <sub>1/2</sub> rep: >1000 (longest of five values)	Yes DT <sub>50</sub> : 271 – 685 days t <sub>1/2</sub> rep: >1000 (longest of five values)	Yes DT <sub>50</sub> : 4 – 364 days t <sub>1/2</sub> rep: 364 (longest of four values)
	Water/Sediment Whole System	Half-life $\geq 182$ days (water) $\geq 365$ days (sediment)	No <sup>7</sup> DT <sub>50</sub> : 24 – 45 days t <sub>1/2</sub> rep: 229 (longest of two t <sub>1/2</sub> rep values)	NA	NA	NA	NA
	Air	Half-life $\geq 2$ days or evidence of long range transport	NA (non-volatile)	NA	NA	NA	NA
Bioaccumulation <sup>4</sup>	Log K <sub>ow</sub> $\geq 5$		No 3.6 (at pH 7)	No -0.05	No 2.95	No -0.52	No -2.02
	BCF $\geq 5000$		No $\leq 87$ whole fish (kinetic and steady state BCF)	NA	NA	NA	NA
	BAF $\geq 5000$		NA	NA	NA	NA	NA
Is the chemical a TSMP Track 1 substance (all four criteria must be met)?			No, does not meet TSMP Track 1 criteria.	No, does not meet TSMP Track 1 criteria.	No, does not meet TSMP Track 1 criteria.	No, does not meet TSMP Track 1 criteria.	No, does not meet TSMP Track 1 criteria.
<sup>1</sup> All pesticides will be considered CEPA-toxic or CEPA toxic equivalent for the purpose of initially assessing a pesticide against the TSMP criteria. Assessment of the CEPA toxicity criteria may be refined if required (i.e., all other TSMP criteria are met).							

<sup>2</sup>The policy considers a substance “predominantly anthropogenic” if, based on expert judgement, its concentration in the environment medium is largely due to human activity, rather than to natural sources or releases.

<sup>3</sup> If the pesticide and/or the transformation product(s) meet one persistence criterion identified for one media (soil, water, sediment or air) than the criterion for persistence is considered to be met.

<sup>4</sup>Field data (for example, BAFs) are preferred over laboratory data (for example, BCFs) which, in turn, are preferred over chemical properties (for example, log  $K_{ow}$ ).

<sup>5</sup>IN-QPS10 was considered to be a major soil transformation product by the applicant, but not by the PMRA.

<sup>6</sup>Oxathiapiprolin meets the TSMP persistence criteria for soil based on the longest available representative half-life of 231 days.

<sup>7</sup>Oxathiapiprolin meets the TSMP persistence criteria for water based on a whole-system representative half-life of 229 days; however, oxathiapiprolin is not expected to be persistent in water ( $DT_{50}$  6 – 14 days) as it will readily partition to sediments. In sediments, representative half-lives of up to 249 days are below the criteria of  $\geq 365$  days. Aquatic transformation products: Persistence data are not available for oxathiapiprolin aquatic transformation products; however, it is not expected to form any major aquatic transformation products that meet all Track 1 criteria based on Log  $K_{ow}$  values: IN-RYJ52 (Log  $K_{ow}$  = 2.24), IN-S2K66 (Log  $K_{ow}$  = 3.41), IN-Q7D41 (Log  $K_{ow}$  = 4.31), IN-RSE01 (Log  $K_{ow}$  = 2.78), IN-S2K67 (Log  $K_{ow}$  = 1.56), IN-QFD61 (Log  $K_{ow}$  = 2.05), 2,6-DFBA (Log  $K_{ow}$   $\leq$  1.92) and IN-P3X26 (Log  $K_{ow}$  = 0.25). In aerobic water-sediment systems, oxathiapiprolin transforms directly to IN-Q7D41, and levels of this transformation product generally increased until study conclusion. The Log  $K_{ow}$  for IN-Q7D41 is greater than that of the parent oxathiapiprolin; however it is structurally identical to the parent, except for having two fewer hydrogen atoms and is therefore not expected to be any more bioaccumulative than oxathiapiprolin.

**Table 26 Registered Alternatives (as of May, 2015)**

The following fungicides are registered for control or suppression of the subject diseases. The fungicide classes indicated in this table may not be registered on all crops within a crop group. Seed treatment fungicides are not included in the table.

<b>Crop(s) / Crop Group</b>	<b>Disease</b>	<b>Mode of Action Groups*</b>
Brassica Vegetables	Downy mildew	7, 11, 21, 33, 40, 43, 44, 7+11, 7+40, M
Bulb Vegetables	Downy mildew	7, 11, 33, 40, 44, M, 4+M, 7+11
Cucurbit Vegetables	Downy mildew	11, 21, 28, 33, 40, 43, 44, 45, M, NC, 28+M, 40+45, U+M
	<i>Phytophthora</i> blight	33, 40, 43, 44, 40+45
Leafy Vegetables	Downy mildew	4, 11, 21, 33, 40, 43, 44, 45, M, U, 4+M, 7+11, 40+45
Tomato, pepper, eggplant	Late blight	11, 21, 28, 33, 40, 43, 44, M, NC, 11+27, 28+M, 40+45
	<i>Phytophthora</i> blight	29, 40, 43, 44, 45, 3+11, 40+45
Potato	Late blight	11, 21, 22, 27, 29, 33, 40, 43, 45, M, U, 4+M, 11+27
Tobacco	Blue mould	4, 11, 33, M, P, 40+M
Ginseng	<i>Phytophthora</i> blight and/or root rot	4, 11, 33, 40, 44, M
Succulent pea	Downy mildew	11, 7+11

	Control of phytophthora blight ( <i>Phytophthora capsici</i> )	<b>Foliar Rates:</b> 0.175 to 0.35 L/ha (17.5 – 35 g a.i./ha);

<p>bittermelon, Chinese cucumber); muskmelon (includes cantaloupe); pumpkin; squash, summer; squash, winter (includes butternut squash, calabaza, hubbard squash, acorn squash, spaghetti squash); watermelon</p> <p>Greenhouse cucumber</p>		<p><b>Drench rates:</b> 0.7 to 2.8L/ha (70 – 280 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development. Continue foliar applications on a 5 – 14 day interval and soil applications on a 7 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p>
<p><b>Leafy Vegetables (Crop Group 4)</b></p> <p>Amaranth, leafy; Arugula, Cardoon, Celery, Celery (Chinese), Celtuce, Chevril, Chrysanthemum (edible leaved), Chrysanthemum (garland), Corn Salad, Cress (garland), Cress (upland), Dandelion leaves, Dock, Endive, Florence Fennel, Lettuce (head &amp; leaf), Orach, Parsley leaves, Purslane (garden), Purslane (winter), Radicchio, Rhubarb, Spinach, Spinach (vine), Spinach (New Zealand), Swiss Chard</p>	<p>Control of downy mildew (<i>Bremia lactucae</i>, <i>Peronospora</i> spp.)</p>	<p><b>Rates:</b> 0.175 to 0.35 L/ha (17.5 – 35 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 5 – 14 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p>
<p><b>Tomato, Pepper, Eggplant</b></p> <p>Greenhouse tomato</p> <p>Greenhouse pepper</p>	<p>Control of late blight (<i>Phytophthora infestans</i>)</p> <hr/> <p>Control of phytophthora blight (<i>Phytophthora capsici</i>)</p>	<p><b>Rates:</b> 0.175 to 0.35 L/ha (17.5 – 35 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 5 – 14 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p> <hr/> <p><b>Foliar Rates:</b> 0.175 to 0.35 L/ha (17.5 – 35 g a.i./ha)</p> <p><b>Drench rates:</b> 0.7 to 2.8L/ha (70 – 280</p>

		<p>g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development. Continue foliar applications on a 5 – 14 day interval and soil applications on a 7 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p>
<b>Potato</b>	Control of late blight ( <i>Phytophthora infestans</i> )	<p><b>Rates:</b> 0.12 to 0.35 L/ha (12 – 35 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 7 – 14 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p>
<b>Tobacco</b>	Control of blue mould ( <i>Peronospora tabacina</i> )	<p><b>Rates:</b> 0.20 – 0.35 L/ha (20 – 35 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 7 – 14 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p>
<b>Ginseng</b>	Control of phytophthora foliar blight and root rot ( <i>Phytophthora cactorum</i> )	<p><b>Rates:</b> 0.7 – 2.8 L/ha (70 – 280 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 7 – 14 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p>
<b>Succulent pea</b> <i>(Pisum</i> spp., includes dwarf pea, edible-pod pea, snow pea, sugar snap pea, English pea, garden pea, green pea)	Control of downy mildew ( <i>Peronospora viciae</i> )	<p><b>Rates:</b> 0.175 to 0.35 L/ha (17.5 – 35 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 7 – 14 day interval.</p> <p><b>Other:</b> Use higher rate and shorter interval when disease pressure is high.</p>

**Resistance Management:** Do not follow soil applications of Dupont Zorvec Enicade Fungicide, Orondis Fungicide, Dupont Zorvec Epicaltrin Fungicide, or OXTP 200SC Fungicide with foliar applications of Dupont Zorvec Enicade Fungicide or Orondis Fungicide. Use either soil applications or foliar applications but not both for the control of relevant disease.

Do not make more than 4 applications of product per crop by either method. Where multiple crop cycles are produced in the same year, do not exceed 6 foliar applications per hectare per year for the same crop.

Do not use for more than 1/3 of the total foliar fungicide applications. Maximum seasonal use rate is 1.4 L/ha for foliar use, except for ginseng which is 5.6 L/ha.

Do not use for more than 1/3 of the total soil fungicide applications. Maximum seasonal soil use rate is 5.6 L/ha.

**Table 27.2 Dupont Zorvec Epicaltrin Fungicide / OXTP 200SC Fungicide**

<b>Crop / Crop Group</b>	<b>Disease claim</b>	<b>Use Pattern</b>
<p><b>Cucurbit Vegetables (Crop Group 9)</b></p> <p>Chinese waxgourd (Chinese preserving melon); citron melon; cucumber; gherkin; gourd, edible (includes hyotan, cucuzza, hechima, Chinese okra); <u>Momordica</u> spp (includes balsam apple, balsam pear, bittermelon, Chinese cucumber); muskmelon (includes cantaloupe); pumpkin; squash, summer; squash, winter (includes butternut squash, calabaza, hubbard squash, acorn squash, spaghetti squash); watermelon</p>	<p>Control of phytophthora blight (<i>Phytophthora capsici</i>)</p>	<p><b>Rates:</b> 0.35 to 1.4L/ha (70 – 280 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 7 day interval.</p> <p><b>Other:</b> Apply at plant, in furrow, drip or in transplant water. <b>Tomato, Pepper, Eggplant</b>	Control of phytophthora blight ( <i>Phytophthora capsici</i> )	<p><b>Rates:</b> 0.35 to 1.4L/ha (70 – 280 g a.i./ha)</p> <p><b>Timing:</b> Begin applications prior to disease development and continue on a 7 day interval.</p> <p><b>Other:</b> Apply at plant, in furrow, drip or in transplant water. Use higher rate when disease pressure is high.</p>
<p><b>Resistance Management:</b> Do not make more than 4 applications of product per crop. The maximum seasonal use rate 2.8 L/ha.</p> <p>Do not follow soil applications of Dupont Zorvec Epicaltrin Fungicide and OXTP 200SC Fungicide with foliar applications of Dupont Zorvec Enicade Fungicide and Orondis Fungicide. Use either soil applications or foliar applications but not both to control the relevant disease.</p>		

## Appendix II Supplemental Maximum Residue Limit Information— International Situation and Trade Implications

Oxathiapiprolin is a new active ingredient which is concurrently being registered in Canada and the United States. The MRLs proposed for oxathiapiprolin in Canada are the same as corresponding tolerances to be promulgated in the United States, except for imported grapes and livestock commodities, in accordance with Table 1.

Once established, the American tolerances for oxathiapiprolin will be listed in the Electronic Code of Federal Regulations, 40 CFR Part 180, by pesticide.

Currently, there are no Codex MRLs<sup>9</sup> listed for oxathiapiprolin in or on any commodity on the Codex Alimentarius Pesticide Residues in Food website.

**Table 1 Comparison of Canadian MRLs, American Tolerances and Codex MRLs (where different)**

Food Commodity	Canadian MRL (ppm)	American Tolerance (ppm)	Codex MRL (ppm)
Grapes	Not Established	0.7	Not Established
Eggs, milk, fat, meat and meat byproducts of cattle, goats, horses, hogs and sheep	0.01	Not Established	Not Established

MRLs may vary from one country to another for a number of reasons, including differences in pesticide use patterns and the locations of the field crop trials used to generate residue chemistry data. For animal commodities, differences in MRLs can be due to different livestock feed items and practices.

Under the North American Free Trade Agreement (NAFTA), Canada, the United States and Mexico are committed to resolving MRL discrepancies to the broadest extent possible. Harmonization will standardize the protection of human health across North America and promote the free trade of safe food products. Until harmonization is achieved, the Canadian MRLs specified in this document are necessary. The differences in MRLs outlined above are not expected to impact businesses negatively or adversely affect international competitiveness of Canadian firms or to negatively affect any regions of Canada

<sup>9</sup> The Codex Alimentarius Commission is an international organization under the auspices of the United Nations that develops international food standards, including MRLs.
