¹ The seasonally adjusted annual rate (SAAR) is a monthly figure for starts adjusted to remove normal season variation and multiplied by 12 to reflect annual levels. By removing seasonal ups and downs, seasonal adjustment allows for a comparison from one season to the next and from one month to the next. Reporting monthly figures at annual rates indicates the annual level of starts that would be obtained if the monthly pace was maintained for 12 months. This facilitates comparison of the current pace of activity to annual forecasts as well as to historical annual levels.

New Home Market

Housing starts in the Hamilton Census Metropolitan Area (CMA) were trending up at 1,497 units in June compared to 1,337 units in May, following seven consecutive monthly declines. The trend is a six-month moving average of the monthly seasonally adjusted annual rates (SAAR) of housing starts. The trend reversal was mainly due to a rebound in townhouse starts. Warmer temperatures and a pickup in demand encouraged builders to increase the number of townhouse starts. The sales-to-new-listings ratio of existing townhouses remained high which resulted in a spill over of demand to the market for new townhouses. Specifically, the number of existing townhouses sold increased by ten per cent in the first six months of 2015 compared to the same period a year ago. Generally, new home sales tend to follow a pattern that is very similar to existing home sales with a threemonth lag. Consequently, the number of new townhouses absorbed reached 112 units in June 2015, up from 80 units in the same month a year earlier.

The standalone quarterly SAAR measure of total housing starts was up significantly in the second quarter compared to the first quarter of 2015. On a monthly basis, the SAAR measure was 2,608 units in June, up from 2,164 units in May, marking three consecutive monthly increases. Similar to the trend measure, the June increase in the SAAR measure of housing starts reflected continued strength in single-detached housing construction and a rebound in townhouse starts. Single-detached

housing starts continued their upward trajectory in June, as limited supply of single-detached homes in established locations in the Greater Toronto Area (GTA) encouraged some buyers to move to Hamilton. This migration pattern continued to support residential construction in Hamilton.

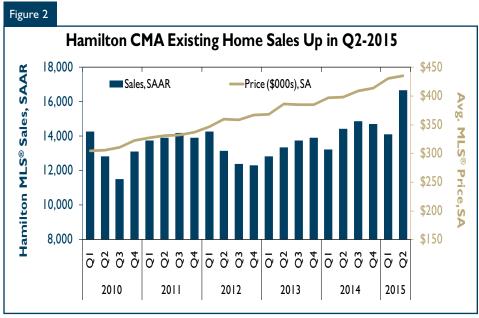

Municipalities in the City of Hamilton, the City of Burlington and the Town of Grimsby issued combined building permits for 186 residential units in May 2015, up 4.5 per cent from the number of permits issued in the same month a year ago. This was the second consecutive year-over-year increase in total residential building permits. Higher construction intentions in the townhouse segment were responsible for all of the increase. Prior to the May increase, townhouse building permits were down for two consecutive months as builders scaled back to reduce the relatively high

inventory of unsold townhouses.

On a seasonally adjusted basis, the New Housing Price Index (NHPI)² for Hamilton was relatively flat in May compared to the previous month, following a marginal decline in April. On a year-over-year basis, the NHPI rose 3.2 per cent in May 2015 compared to the same month in 2014. Hamilton recorded the largest new home price increase among all Census Metropolitan Areas in Canada. Builders in Hamilton cited higher land development costs as a major factor that contributed to the year-over-year increase in the NHPI.A tight existing home market also encouraged some buyers to meet their needs in the new home market.

Existing Home Market

On a seasonally adjusted basis, Hamilton's existing home sales were

²The New Housing Price Index (NHPI) is a monthly series that measures changes over time in the contractors' selling prices of new residential houses, where detailed specifications pertaining to each house remain the same between two consecutive periods. For the NHPI, the universe consists of builders in 21 metropolitan areas who mainly build single unit houses in such volume or in such a fashion that they can report selling prices for comparable transactions. Data are collected directly from survey respondents and derived from other Statistics Canada surveys. Responding to this survey is mandatory.

up 18 per cent in the second quarter compared to the first quarter of 2015, following two consecutive quarterly declines. Similar to activities in the new home market, warmer temperatures and a pickup in demand helped explain the exceptionally strong existing home sales in the second quarter. Strengthening employment and low mortgage rates supported homeownership demand in Hamilton. According to Statistics Canada labour force survey data, Hamilton's economy created a net 2,700 new jobs in June on a seasonally adjusted basis, marking the fourth consecutive monthly gain. Full-time employment has been higher for two straight months, on a year-over-year basis. The current momentum in full-time job creation suggests that employers are regaining confidence in Hamilton's economic recovery. The unemployment rate remained practically stable at 5.2 per cent in June.

New listings were up nine per cent in the second quarter compared to the previous quarter, on a seasonally adjusted basis. This was the strongest growth since the second quarter of 2014, when the number of new listings grew by 11 per cent. The average home price was up by only one per cent in the second quarter compared to four per cent in the first quarter. The small gain in the average price was mainly due to a compositional shift in demand. The increase in the lower price ranges was the most pronounced; an indication there was more first-time buyer demand. Hamilton's existing home market remained tight.

The sales-to-new-listings ratio (SNLR)³ was 78 per cent in the second quarter, up from 72 per cent in the first quarter. The ratio indicated a strong sellers' market in the second quarter. The SNLR has been above 70 per cent since the first quarter of 2013. The SNLR is an indicator of

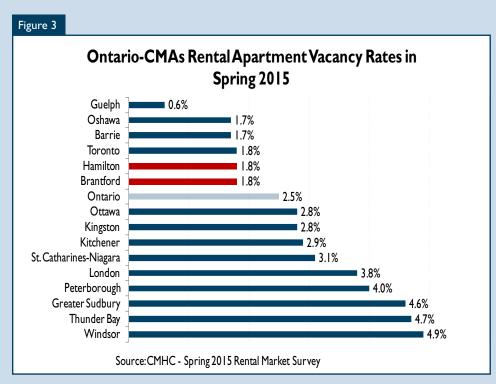

price pressure in the existing home market. New listings are a gauge of the supply of existing homes coming onto the market, while sales are a proxy for demand.

On a year-over-year basis, existing home sales in the Hamilton CMA were up 18 per cent in the second quarter 2015 compared to the second quarter 2014. This marked the ninth consecutive quarter of year-over-year sales increase. Existing home sales were up across all local areas in the second quarter 2015. The strongest growth was in Hamilton Centre where sales increased by 46 per cent. Hamilton Centre continued to attract buyers who are looking for a bargain as this area remained the most affordable in the Hamilton CMA. In line with tight market conditions, the average home price was up in all local areas with Flamborough recording the strongest growth in the second quarter 2015 compared to the same quarter a year ago.

³ A sales-to-new-listings ratio above 60 per cent is associated with a sellers' market. In a sellers' market, home prices generally rise more rapidly than overall inflation. A sales-to-new-listings ratio below 40 per cent has historically accompanied prices that are rising at rates less than inflation, a situation known as a buyers' market. When the sales-to-new-listings ratio is between these two thresholds, the market is said to be balanced.

Lower Apartment Vacancy Rates in Hamilton and Brantford

Renters have less rental accommodation to choose from. according to Canada Mortgage and Housing Corporation's (CMHC) spring 2015 Rental Market Survey. The Hamilton Census Metropolitan Areas (CMA) average apartment vacancy rate was 1.8 per cent in the spring of 2015, down from 3.9 per cent in the spring of 2014. The Brantford CMA average apartment vacancy rate decreased to 1.8 per cent, from 4.4 per cent in the spring of 2014. In both centres, less supply was a factor leading to the vacancy rate decline. A relatively high number of removals contributed to the decline in supply of rental units in the spring 2015.

Strong job growth among youth in the prime renting age (those between the ages 18 and 24) encouraged household formation among young adults in Hamilton. A higher level of household formation among this group tends to increase overall rental housing demand, as young adults are predominantly renters. Meanwhile, strong house price appreciation eroded homeownership affordability, particularly among local residents in established neighbourhoods. Consequently, higher mortgage carrying costs relative to apartment rents discouraged some renters from vacating their rental units in favour of homeownership.

In line with a lower average vacancy rate, the fixed sample two-bedroom apartment rent⁴ in Hamilton grew at a faster pace of 3.5 per cent, from 2.8 per cent in the spring of 2014. In Brantford, the fixed sample two-bedroom apartment rent was up 2.8 per cent, compared to an increase of 2.4 per cent in the spring of 2014.

For detail data on CMHC-Spring 2015 Rental Market Survey (Ontario Highlights) click here

⁴The Percentage Change of Average Rent is a measure of the market movement, and is based on those structures that were common to the survey sample for both years.

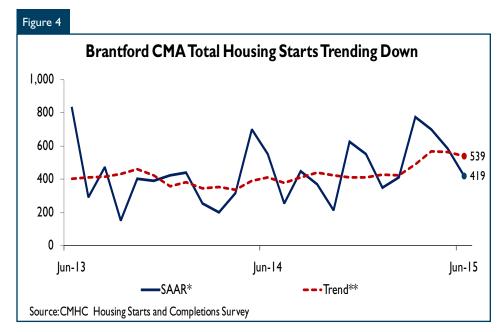

Brantford CMA Highlights

- Brantford housing starts trending down.
- Fewer single-detached housing starts.
- Existing home sales were up.

New Home Market

Housing starts in the Brantford Census Metropolitan Area (CMA) were trending down at 539 units in June compared to 562 units in May. This month's decline in the trend measure was entirely due to fewer single-detached housing starts. The increase in townhouse starts was not enough to completely offset the decline in single-detached housing starts. Strong employment growth among the 25 to 44 age group continued to support the demand for townhouses. This age group has a higher concentration of first-time buyers, who tend to be more pricesensitive than other buyers. New townhouses are generally more affordable than new single-detached dwellings.

The standalone quarterly SAAR measure of total housing starts was up five per cent in the second quarter compared to the first quarter of 2015. On a monthly basis however, the SAAR measure was 419 units in June, down from 582 units in May. Similar to the trend measure, the June decrease in the SAAR measure of housing starts reflected a slower pace in single-detached housing construction. Despite this month's decline, year-todate ending in June, single-detached housing starts are up 15 per cent compared to the first six months of 2014. Move-up buyers from more expensive neighbouring municipalities

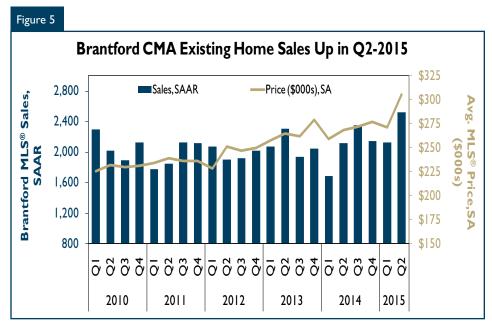

* SAAR1: Seasonally Adjusted Annual Rate.** Trend: Six-month moving average of the SAAR.

have supported single-detached housing demand in Brantford.

Existing Home Market

Brantford's existing home sales were up 19 per cent in the second quarter

compared to the first quarter 2015, on a seasonally adjusted basis. Similar to activities in Hamilton, warmer temperatures and a pickup in demand helped explain the exceptionally strong existing home sales in the second quarter. Full-time employment

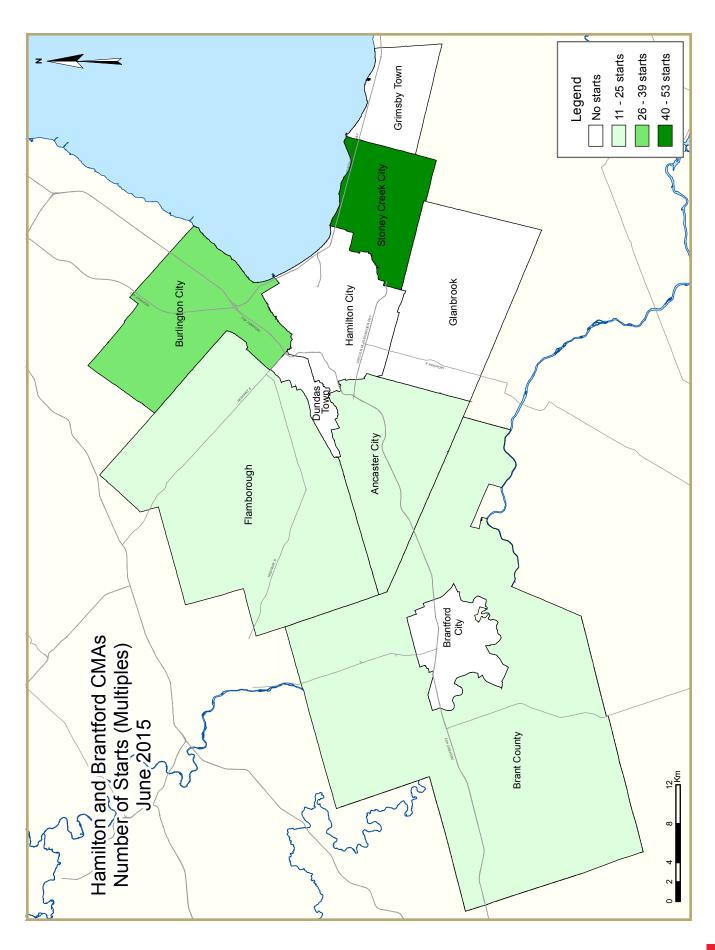

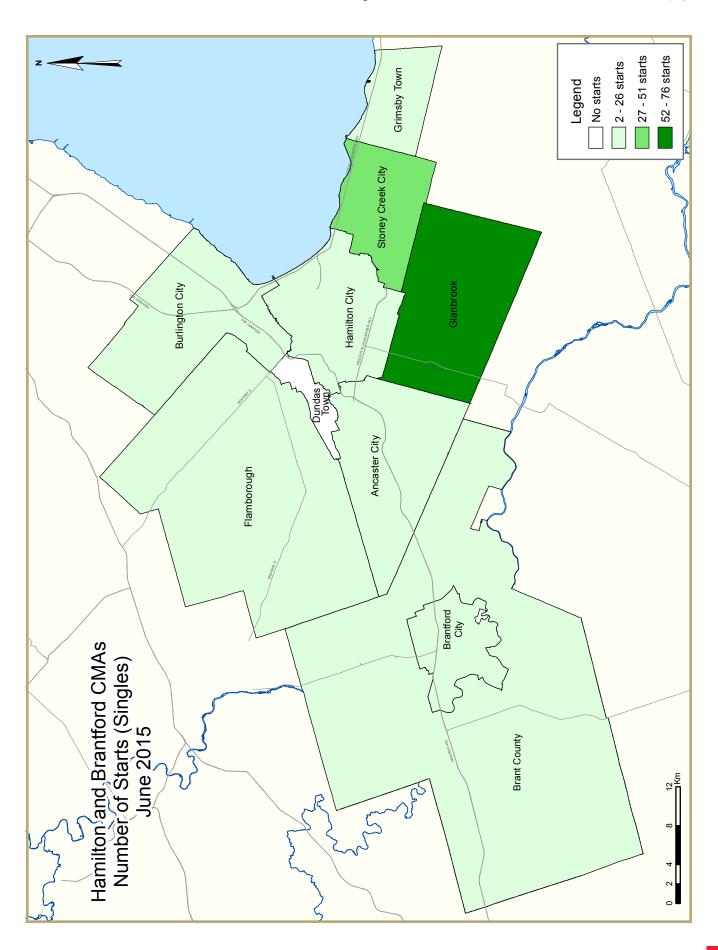

Source: CMHC, adapted from CREA (MLS®)

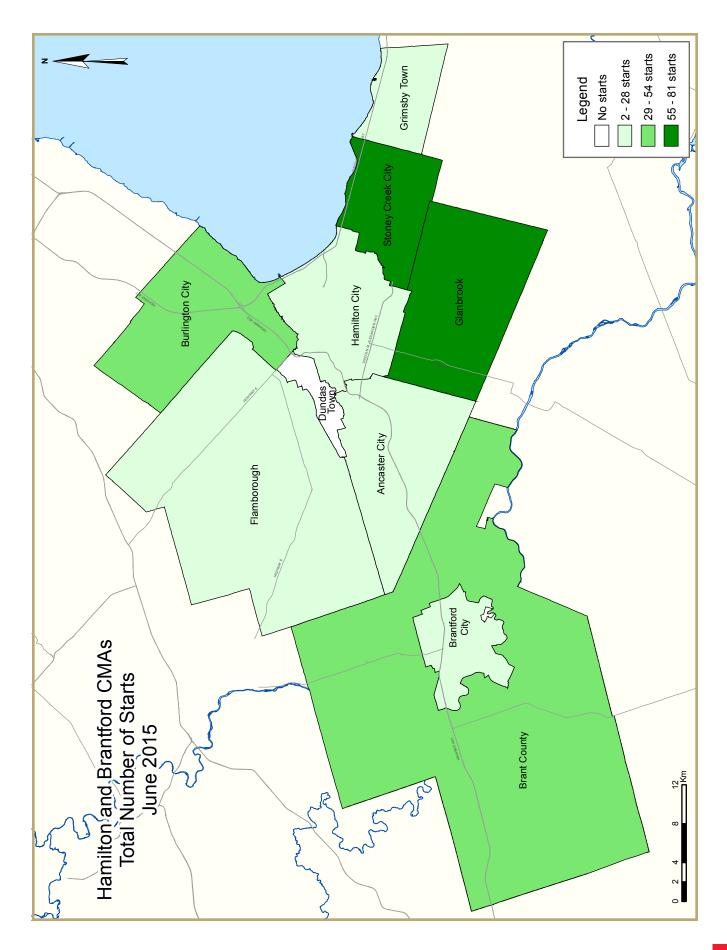

Note: Sales are seasonally adjusted and are multiplied by 4 to show an annual rate. Prices are seasonally adjusted. MLS® is a registered trademark of the Canadian Real Estate Association (CREA).

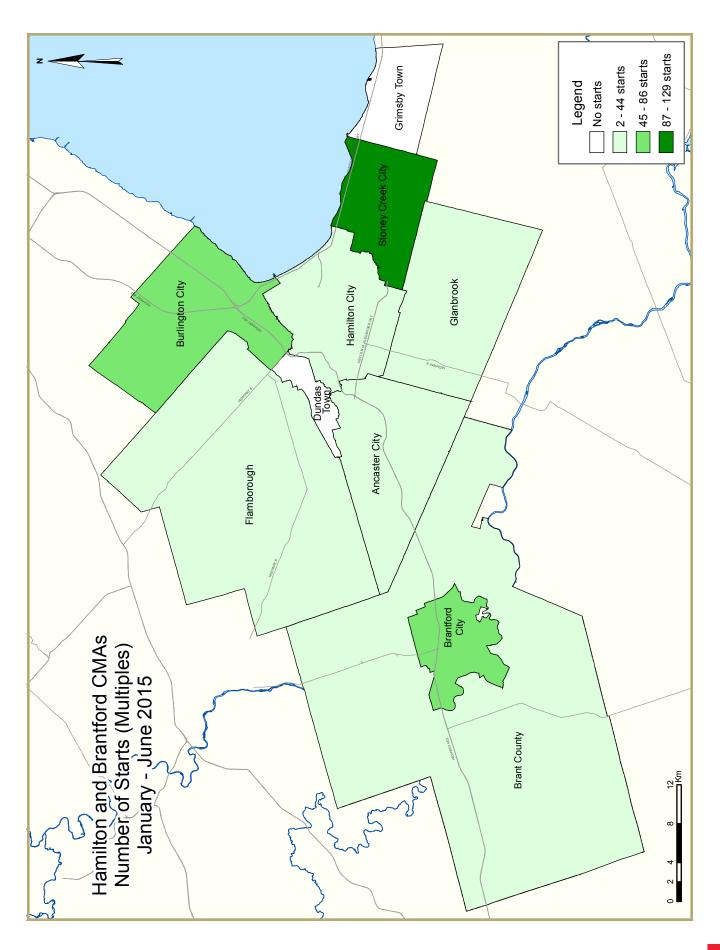

among the prime homebuyer group (age 25 to 44) has been trending up since August 2014. This in turn has supported home sales in Brantford. Despite the recent increases in house prices, the average mortgage carrying cost in Brantford remained lower than in most neighbouring municipalities.

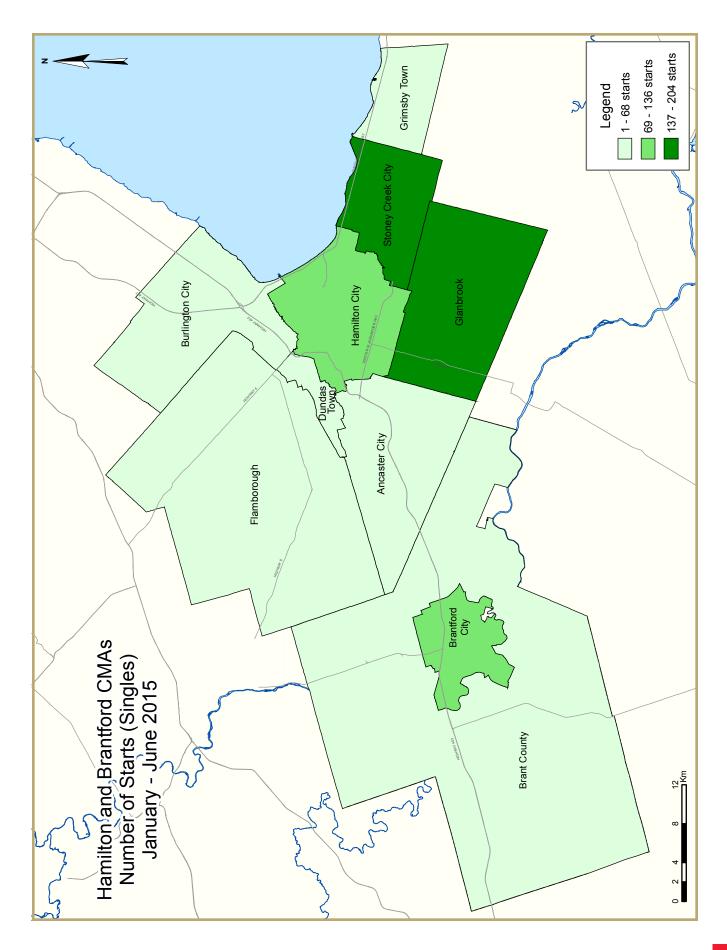

The number of new listings declined by six per cent in the second quarter compared to the previous quarter, on a seasonally adjusted basis. Fewer new listings and a higher number of existing homes sales pushed up the sales-to-new-listings ratio (SNLR) to 87 per cent from 69 per cent in the first quarter. Consequently, the average existing home price was up 12.6 per cent in the second quarter, marking the strongest quarterly growth on record.

METHODOLOGY

Starts & Completions Survey Methodology

The Starts and Completions Survey is conducted by way of site visits which are used to confirm that new units have reached set stages in the construction process. Since most municipalities in the country issue building permits, these are used as an indication of where construction is likely to take place. In areas where there are no permits, reliance has to be placed either on local sources or searching procedures.

The Starts and Completions Survey is carried out monthly in urban areas with population in excess of 50,000, as defined by the 2011 Census. In urban areas with populations of 10,000 to 49,999, all Starts are enumerated in the last month of the quarter (i.e. four times a year, in March, June, September and December). In these centres with quarterly enumeration, Completion activity is modeled based on historical patterns. Monthly Starts and Completions activity in these quarterly locations are statistically estimated at a provincial level for single and multi categories. Centres with populations below 10,000 are enumerated on a sample basis, also in the last month of each quarter (i.e. four times a year, in March, June, September and December).

The Starts and Completions Survey enumerates dwelling units in new structures only, designed for non-transient and year-round occupancy.

Mobile homes are included in the surveys. A mobile home is a type of manufactured house that is completely assembled in a factory and then moved to a foundation before it is occupied.

Trailers or any other movable dwelling (the larger often referred to as a mobile home) with no permanent foundation are excluded from the survey.

Conversions and/or alterations within an existing structure are excluded from the surveys as are seasonal dwellings, such as: summer cottages, hunting and ski cabins, trailers and boat houses; and hostel accommodations, such as: hospitals, nursing homes, penal institutions, convents, monasteries, military and industrial camps, and collective types of accommodation such as: hotels, clubs, and lodging homes.

Market Absorption Survey Methodology

The Market Absorption Survey is carried out in conjunction with the Starts and Completions Survey in urban areas with populations in excess of 50,000. When a structure is recorded as completed, an update is also made as units are sold or rented. The dwellings are then enumerated each month until such time as full absorption occurs.

STARTS AND COMPLETIONS SURVEY AND MARKET ABSORPTION SURVEY DEFINITIONS

A "dwelling unit", for purposes of the Starts and Completions Survey, is defined as a structurally separate set of self-contained living premises with a private entrance from outside the building or from a common hall, lobby, or stairway inside the building. Such an entrance must be one that can be used without passing through another separate dwelling unit.

A "start", for purposes of the Starts and Completions Survey, is defined as the beginning of construction work on a building, usually when the concrete has been poured for the whole of the footing around the structure, or an equivalent stage where a basement will not be part of the structure.

The number of units "under construction" as at the end of the period shown, takes into account certain adjustments which are necessary for various reasons. For example, after a start on a dwelling has commenced construction may cease, or a structure, when completed, may contain more or fewer dwelling units than were reported at start.

A "completion", for purposes of the Starts and Completions Survey, is defined as the stage at which all the proposed construction work on a dwelling unit has been performed, although under some circumstances a dwelling may be counted as completed where up to 10 per cent of the proposed work remains to be done.

The term "absorbed" means that a housing unit is no longer on the market (i.e. has been sold or rented). This usually happens when a binding contract is secured by a non-refundable deposit and has been signed by a qualified purchaser. The purpose of the Market Absorption Survey is to measure the rate at which units are sold or rented after they are completed, as well as collect prices.

DWELLING TYPES:

A "Single-Detached" dwelling (also referred to as "Single") is a building containing only one dwelling unit, which is completely separated on all sides from any other dwelling or structure. Includes link homes, where two units may share a common basement wall but are separated above grade. Also includes cluster-single developments.

A "Semi-Detached (Double)" dwelling (also referred to as "Semi") is one of two dwellings located side-by-side in a building, adjoining no other structure and separated by a common or party wall extending from ground to roof.

A "Row (Townhouse)" dwelling is a one family dwelling unit in a row of three or more attached dwellings separated by a common or party wall extending from ground to roof.

The term "Apartment and other" includes all dwellings other than those described above, including structures commonly known as stacked townhouses, duplexes, triplexes, double duplexes and row duplexes.

INTENDED MARKET:

The "intended market" is the tenure in which the unit is being marketed. This includes the following categories:

Freehold: A residence where the owner owns the dwelling and lot outright.

Condominium (including Strata-Titled): An individual dwelling which is privately owned, but where the building and/or the land are collectively owned by all dwelling unit owners. A condominium is a form of ownership rather than a type of house.

Rental: Dwelling constructed for rental purposes regardless of who finances the structure.

GEOGRAPHICAL TERMS:

A census metropolitan area (CMA) or a census agglomeration (CA) is formed by one or more adjacent municipalities centred on a large urban area (known as the urban core). The census population count of the urban core is at least 10,000 to form a census agglomeration and at least 100,000 to form a census metropolitan area. To be included in the CMA or CA, other adjacent municipalities must have a high degree on integration with the central urban area, as measured by commuting flows derived from census place of work data. CMAs and CAs contain whole municipalities or Census Subdivisions.

A "Rural" area, for the purposes of this publication, is a centre with a population less than 10,000.

All data presented in this publication is based on Statistics Canada's 2006 Census area definitions.

CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for more than 65 years.

Together with other housing stakeholders, we help ensure that the Canadian housing system remains one of the best in the world. We are committed to helping Canadians access a wide choice of quality, environmentally sustainable and affordable housing solutions that will continue to create vibrant and healthy communities and cities across the country.
