

2011 Census/National Household Survey Housing Conditions Series: Issue 2 The Geography of *Core Housing Need* in 2011

INTRODUCTION

This Research Highlight examines housing conditions and *core housing need* in 2011 based on data from the 2011 National Household Survey (see Glossary near the end of this Highlight).

Comparability of data from the National Household Survey (NHS) and previous censuses

Data based on the 2011 NHS and previous censuses (for example, the 2006 Census) may not be strictly comparable due to methodological differences (see Census of Population and National Household Survey, at the end of this Highlight.)

This Research Highlight focuses on the 2011 NHS-based estimates, and not on the differences between these and the 2006 Census-based estimates. This is because the change of methodology from a mandatory to a voluntary survey introduces some uncertainty as to what extent differences are due to actual changes in what is being measured or to what Statistics Canada refers to as survey non-response bias.¹

While the change from a mandatory to voluntary survey may have affected comparability of the data from the NHS to earlier censuses, for 2011 the NHS is the most comprehensive source of data on Canada and about Canadians. The survey sampled about 4.5 million households, with 68.6% (about 3 million households) responding. The NHS continues the census's tradition of providing detailed data not available from other surveys in Canada; useful data from the NHS are available at the municipal and even neighbourhood levels,² as well as for Canada, the provinces and territories. Further, because of the large sample size of the survey, combinations of many variables can be analyzed.

When using the NHS to estimate core housing need, CMHC undertook a comprehensive review of the data, including the inputs into *core housing need*. The housing need estimates, discussed in detail below, reasonably represent housing conditions in 2011.

¹ Non-response bias is a potential source of error for all surveys. It arises when the characteristics of those who choose to participate in the survey are different than those who refuse, and increases as the response rate declines. Generally, the risk of error increases for lower levels of geography and for smaller populations. See *2011 National Household Survey (NHS): Design and Quality*, presentation to the Housing Data Working Group of the National Housing Research Committee on November 5, 2013, at www.nhrc-cnrl.ca/sites/default/files/Margaret%20Michalowski_HD_E_0.pdf (April 14, 2014).

² Statistics Canada has suppressed data for some communities for confidentiality, as well as data quality and non-response issues.

FINDINGS

Canadian housing conditions in 2011 based on data from the 2011 National Household Survey

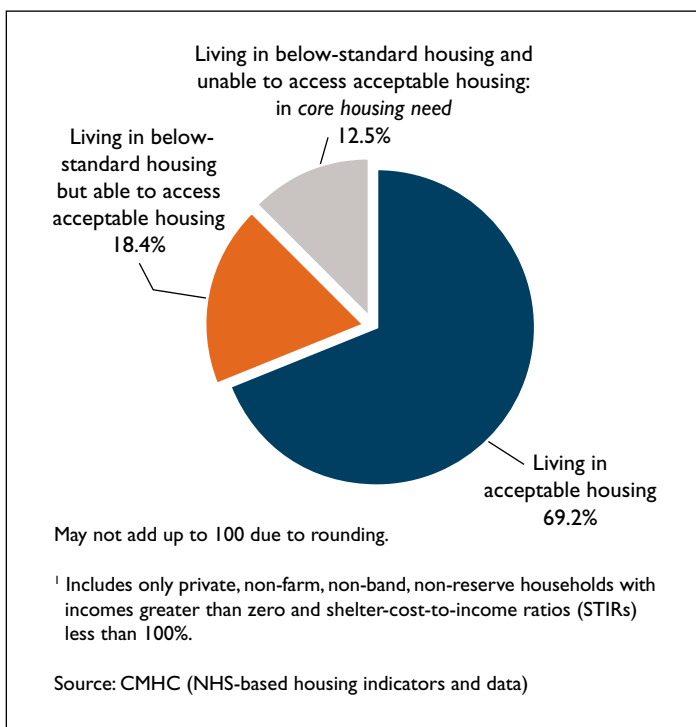

The incidence of households in *core housing need* in 2011 was 12.5%

In 2011, about 87.5% (10.9 million) of Canada’s 12.5 million households either lived in, or had sufficient income to access, acceptable housing (see *Households assessed for core housing need, in the Glossary*). This included the following:

- about 8.6 million households (69.2%) living in acceptable housing; and
- about 2.3 million households (18.4%) who lived in housing below one or more housing standard(s) but who could have afforded acceptable housing in their local housing market.

About 1.6 million Canadian households were in *core housing need* in 2011, and the incidence¹ of *core housing need* was 12.5% (see figure 1 and table 1).

Figure 1 Housing conditions, Canada, 2011¹

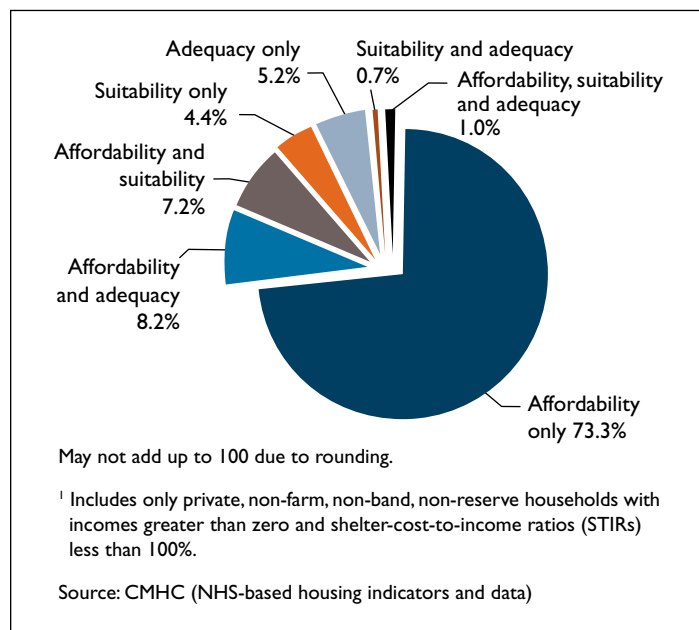

Housing in Canada Online (HiCO)

Use this interactive tool to build custom tables and for analyzing census and NHS data on housing conditions, including *core housing need*. HiCO provides customizable data on socio-economic characteristics and housing conditions across Canada, and in more than 200 communities for census years from 1991 to 2011. Variables include tenure, household type and *core housing need*, with household counts, incomes and shelter costs for each. Like other municipalities and organizations, you can use HiCO to inform the development of local housing strategies, poverty reduction policies, and regional economic plans. It is available on the CMHC website at www.cmhc-schl.gc.ca/en/corp/about/cahoob/cahoob_002.cfm

Most households in core housing need did not meet the affordability standard

In 2011, about 89.7% of households in *core housing need* were below the housing affordability standard, either alone (73.3%) or in combination with at least one of the other two standards (16.4%) (see figure 2). Only about 10.3% of households in *core housing need* did not meet only the suitability and/or adequacy standards.

Figure 2 Households¹ in core housing need by housing standard(s) not met, Canada, 2011

¹ The incidence of core housing need refers to the number of households in *core housing need* as a percentage of all households (both in *core housing need* and not in *core housing need*) for whom core need can be estimated.

Table 1 Households¹ below housing standard(s), Canada, 2011.

Housing standard(s) not met	All Households		Able to Access Acceptable Housing		Unable to Access Acceptable Housing - in <i>Core Housing Need</i>	
	Number	Per cent ²	Number	Per cent ²	Number	Per cent ²
Affordability only	2,311,435	18.5	1,173,720	9.4	1,137,715	9.2
Affordability and adequacy	218,510	1.8	91,100	0.8	127,415	1.0
Affordability and suitability	151,020	1.2	38,855	0.3	112,165	0.9
Affordability, suitability and adequacy	18,200	0.1	3,310	0.0	14,890	0.1
Suitability only	504,740	4.1	436,410	3.5	68,335	0.6
Adequacy only	585,850	4.7	505,775	4.1	80,075	0.6
Suitability and adequacy	53,165	0.4	41,625	0.3	11,545	0.1
Total	3,842,935	30.8	2,290,790	18.4	1,552,145	12.5

¹ Includes only private, non-farm, non-band, non-reserve households with incomes greater than zero and shelter-cost-to-income ratios (STIRs) less than 100%.

² As a percent of the 12.5 million households assessed for *core housing need*.

Source: CMHC (NHS-based housing indicators and data)

Nunavut, Northwest Territories and British Columbia had the highest incidences of *core housing need* in 2011

The incidence of *core housing need* varied among the provinces and territories in 2011 (see table 2). The incidence of *core housing need* was highest in Nunavut (at 39.2%), followed by the Northwest Territories (at 15.7%), and British Columbia (at 15.4%). Prince Edward Island (at 9.2%) and New Brunswick (at 9.9%) had the lowest incidences of *core housing need*.

The number of households in *core housing need* varied from about 2,000 in each of Yukon and the Northwest Territories, and about 3,000 in Nunavut, to about 617,000 in Ontario.

Among households in *core housing need*, Nunavut had the highest average annual household income before taxes (at \$58,079) and the lowest average annual shelter cost (at \$6,228) in 2011.² This resulted in households in *core housing need* in Nunavut having the lowest average STIR (at 12.3%), well below the national average of 49.4% for households in *core housing need*. In Nunavut, 63.5% of the households in *core housing need* lived in housing which did not meet the suitability standard, either alone or in combination with at least one of the other two standards; the comparable percentage among all Canadian households in *core housing need* was 13.3%.

² Reflecting the prevalence of subsidized housing in Nunavut, about 77% of these households were renters living in subsidized housing, hence the relatively low average annual shelter costs.

Table 2 Housing conditions, Canada, provinces and territories, 2011¹

	All Households (#)	Households in Core Housing Need (#)	Incidence of Core Housing Need (%)	For households in <i>core housing need</i>		
				Average Household Income Before Taxes (\$)	Average Shelter Cost (\$)	Average STIR Before Taxes (%)

Northwest Territories	14,150	2,215	15.7	37,500	10,788	32.6
Nunavut	8,545	3,355	39.3	58,079	6,228	12.3

¹ Includes only private, non-farm, non-band, non-reserve households with incomes greater than zero and shelter-cost-to-income ratios (STIRs) less than 100%.

Source: CMHC (NHS-based housing indicators and data)

Among Canada's Census Metropolitan Areas, Vancouver and Toronto had the highest incidences of *core housing need* in 2011

Just under three-quarters of all households in *core housing need* resided in Canada's census metropolitan areas (CMAs). Vancouver (at 17.7%) and Toronto (at 16.9%) had the highest incidences of *core housing need* among CMAs in 2011 (see table 3). Even though households in *core housing need* in Vancouver and Toronto had higher average before-tax household incomes (at \$26,227 and \$28,329, respectively) in 2011 compared to most other CMAs, their average shelter costs (at \$12,468 and \$13,380, respectively) were also higher.

Even though households in *core housing need* in Barrie had the second highest average household income before taxes (at \$27,469), and were closely followed by those in

Abbotsford-Mission (at \$26,897), the shelter costs of households in both of these CMAs were also high, at \$13,284 and \$12,252, respectively, resulting in above-average incidences of *core housing need* of 14.0% for both these CMAs, above the average for all CMAs of 13.4%.

Saguenay had the lowest incidence of *core housing need* (at 5.9%), followed by Trois-Rivières (at 8.2%), Québec (at 8.6%), Moncton (at 9.5%) and Sherbrooke (at 9.8%).

About 43% of all households in *core housing need* in 2011 lived in Toronto, Montréal or Vancouver

Toronto accounted for about 20% of all households in *core housing need* in Canada in 2011, Montréal for about 13% and Vancouver for about 9%.

Table 3 Housing conditions, Canada and census metropolitan areas, sorted by incidence of core housing need, 2011¹

	All Households (#)	Households in Core Housing Need (#)	Incidence of Core Housing Need (%)	For households in core housing need

GLOSSARY

Acceptable housing and core housing need

Acceptable housing is adequate in condition, suitable in size, and affordable.

- **Adequate** housing does not require any major repairs, according to residents. Major repairs include those to defective plumbing or electrical wiring, or structural repairs to walls, floors or ceilings.
- **Suitable** housing has enough bedrooms for the size and makeup of resident households, according to National Occupancy Standard (NOS) requirements. Enough bedrooms based on NOS requirements means one bedroom for each cohabiting adult couple; lone parent; unattached household member age 18 or older; same-sex pair of children under age 18; and additional boy or girl in the family, unless there are two opposite sex children under 5 years of age, in which case they are expected to share a bedroom. A household of one individual can occupy a bachelor unit (example, a unit with no bedroom).
- **Affordable** housing costs less than 30% of before-tax household income. For renters, shelter costs include, as applicable, rent and payments for electricity, fuel, water and other municipal services. For owners, shelter costs include, as applicable, mortgage payments (principal and interest), property taxes, condominium fees, and payments for electricity, fuel, water and other municipal services.

A household is in **core housing need** if its housing does not meet one or more of the adequacy, suitability or affordability standards and it would have to spend 30% or more of its before-tax income to access local housing that meets all three standards.

Assessing whether a household is in **core housing need** thus involves **two steps**:

1. **determining whether or not the household lives in acceptable housing;** and
2. **if the household does not live in acceptable housing,** determining whether its before-tax income is sufficient to access acceptable local housing.

Not all households in below-standard housing are in core housing need

If a household not living in acceptable housing can access acceptable local housing for less than 30% of its before-tax income, it is not in **core housing need**; it is in **core housing need** only if acceptable local housing would cost 30% or more of its before-tax income. In communities where market rents can be estimated, the cost of acceptable housing is calculated using the median rent of rental units with the number of bedrooms the household requires. Elsewhere, the cost of acceptable housing is based on the estimated monthly carrying cost of a newly constructed home with the number of bedrooms the household requires.

Households assessed for core housing need

Only private, non-farm, non-band, non-reserve households with incomes greater than zero and **shelter-cost-to-income ratios (STIRs)** less than 100% are assessed for **core housing need**. Farms are excluded because shelter costs for farm households are not separable from costs related to other farm structures. Band households are excluded because shelter costs are not collected for households whose housing costs are paid through band housing arrangements. For the purpose of measuring affordability, CMHC regards STIRs of 100% or more, STIRs for households with incomes of zero or less, and STIRs of households living in non-band housing on reserves¹ as uninterpretable.

The **STIR** is calculated for each household by dividing its total shelter cost by its total household income. Shelter costs include, as applicable, rent, mortgage payments (principal and interest), property taxes, condominium fees, and payments for electricity, fuel, water and other municipal services. The average STIR for a particular group is the average of the STIRs recorded for each household in that group; it cannot be calculated by dividing the group's total average shelter cost by the group's total average income.

¹ Given communal land tenure in most reserve communities, the distinction among different tenures as reported on-reserve may be less clear than off-reserve.

Census of Population and National Household Survey

Census of Population

The Census of Population collects demographic and other information on the population of Canada. Its large sample provides extensive scope for cross-classification of data and a degree of local geographic detail that surveys with smaller samples cannot match.

In recent years prior to changes introduced in 2011, the census consisted of two mandatory questionnaires: a short-form and a long-form. Most households (80%) received only the short-form questionnaire, which contained questions on basic topics such as age, sex, marital status, and mother tongue. One in five households (20%) received the long-form questionnaire, which contained additional questions on topics such as education, ethnicity, mobility, income, employment, housing and dwelling characteristics. Starting with the 1991 Census, CMHC began deriving *core housing need* estimates using data from the long-form questionnaire.

The **2011 Census** was conducted using a short-form questionnaire, which consisted of the following components:

1. the same eight questions that appeared on the 2006 Census short-form questionnaire; and
2. two additional questions on knowledge of official languages and languages spoken at home.

It collected data from some 33.5 million people and 13.5 million households.

The National Household Survey (NHS), 2011

In 2011, the mandatory long-form census questionnaire was replaced by the voluntary *National Household Survey* (NHS). The NHS provides social and economic information for communities so that they may better plan services such as child care, schooling, family services, housing, roads and public transportation, and skills training for employment. A random sample of 4.5 million households was invited to respond to a 64-question survey questionnaire which Statistics Canada had updated from the long-form questionnaire used in the 2006 Census. In remote areas and on Indian reserves, information was gathered in face-to-face interviews. In other areas of the country, respondents were asked to complete the questionnaire online or by mail; and follow-up was conducted by enumerators with households who had not yet responded. About 3 million households responded; the response rate was 68.6%, similar to rates on other voluntary surveys conducted by Statistics Canada.

Income estimates from the 2011 NHS are for 2010, and shelter cost estimates are for 2011.

Notes:

Figures may not add due to rounding. Percentages based on unrounded counts.

¹ Statistics Canada uses the global non-response rate (GNR) as a data quality indicator for data from the 2011 National Household Survey. The higher the GNR, the higher the non-response bias, and so the lower the quality of the data. See Statistics Canada's *National Household Survey User Guide* (Cat. No.99-001-x2011001, link: http://www12.statcan.gc.ca/nhs-enm/2011/ref/nhs-enm_guide/index-eng.cfm) for more details.

² Households assessed include only private, non-farm, non-band, non-reserve households with incomes greater than zero and STIRs less than 100%.

³ A household may fall below more than one housing standard. As a result, the sum of households below the affordability standard, households below the suitability standard, and households below the adequacy standard exceeds the total number of households below standards.

Notes:

Figures may not add due to rounding. Percentages based on unrounded counts.

¹ Statistics Canada uses the global non-response rate (GNR) as a data quality indicator for data from the 2011 National Household Survey. The higher the GNR, the higher the non-response bias, and so the lower the quality of the data. See Statistics Canada's *National Household Survey User Guide* (Cat. No.99-001-x2011001, link: http://www12.statcan.gc.ca/nhs-enm/2011/ref/nhs-enm_guide/index-eng.cfm) for more details.

² Households assessed include only private, non-farm, non-band, non-reserve households with incomes greater than zero and STIRs less than 100%.

³ A household may fall below more than one housing standard. As a result, the sum of households below the affordability standard, households below the suitability standard, and households below the adequacy standard exceeds the total number of households below standards.

Research Highlight

2011 Census/National Household Survey Housing Conditions Series: Issue 2 The Geography of *Core Housing Need* in 2011

SUMMARY

In 2011, 10.9 million households - 87.5% of households assessed - either lived in, or had sufficient incomes to access, acceptable housing. The remaining 1.6 million, or 12.5% of households, were assessed as living in *core housing need*. Most households in *core housing need* lived below the affordability standard (89.7%) alone or in combination with other standards. The incidence of *core housing need* was highest in Nunavut (at 39.2%) and lowest in Prince Edward Island (at 9.2%). Vancouver (at 17.7%) and Toronto (at 16.9%) had the highest incidences of *core housing need* among census metropolitan areas in 2011.

CMHC will be publishing additional issues in this series of Research Highlights examining housing conditions drawing on data from the 2011 National Household Survey. Additional analysis of housing affordability and need will be presented in the 2014 Canadian Housing Observer.
