DEPARTMENT OF TRADE AND COMMERCE
DOMINION BUREAU OF STATISTICS
EMPLOYMENT AND PAYROLL STATISTICS BRANCH
OTTAWA－CANADA

The Dominion Bureau of Statistics，in its third monthly report on man－ hours and hourly earnings，presents the data reported by employers at the beginning of March，with comparative statistics for Jan． 1 and Feb。1。 These statistics relate in the main to those wage earners for whom the employer keeps a record of the number of hours worked，thus referring chiefly to persons employed at hourly rates．Salaried persons are purposely excluded from the statistics of man－hours， while such information is not available for certain categories of wage earners， whose earnings，like those of salaried personnel，are not directly proportioned to the number of hours they work．Consequently，the number of wage earners for whom data are given in the present bulletin is smaller than the number of salaried employees and wage－earners for whom information on employment and payrolls was published in the Mar．I monthly survey on these subjects．

The firms furnishing statistics at the latest date are not necessarily the same as those whose reports were compiled in earlier tabulations；however，the data are generally comparable．For the present，information is being published only for the various branches of manufacturing，and for mining，building and high way construction and maintenance，among the non manufacturing divisions．Later on， it is hoped to add to the list of industries for which such statistics are given； it is also the intention in the near future to publish data for the provinces and leading cities．

Preliminary statistics are given in the table on page 4 ，which shows the average number of hours worked per week，the average hourly earnings，and the average weekly wages as at Mar。1。 $\mathrm{Feb}, 1$ and Jana．The figures of average weekly wages are obtained by multiplying the average hours worked at the indicated date by the average hourly earnings then reported．The manohours data include overtime，as well as the hours worked by part－time and casual workers． Hours credited to persons absent on leave with pay are included in the statistics as though the hours for which payment was made had been worked．The wages reported are mainly those paid to persons employed at hourly rates，or to persons for whom a record of hours worked is kept．Incentive and production bonuses， overtime payment and sums paid persons absent on leave with pay during the pay period for which statistics are furnished are included．The wages reported represent gross earnings before deductions were made for taxes，Unemployment Insurance，etc．

In manufacturing，there was a small decline in employment at Mar． 1 as compared with Fob．1，but the number of hours worked slightly increased，from
nestimpted itsure of $38, \$ 63,800$ is the wed preceding that cate tio a reported total of $38,719,771$ in the week precedinf; liar $l_{s}$ when the number of wage-earners working these hours was 844,673 . The average hours per week were 45.8 , while the average at Feb. 1 was 45.4 ; the low figure of 39.5 at Jan。 1 , (as shown in the following recapitulation of the available (igures). resulted from the observance of the year-ond holidays. The declines in the latest averages as compared with those for Nov. I and Dec. ] are largely due to alterations in the industrial distribution in the last four or İve months; changes in the reporting firms may also have had an offect.

|  | No. | $\not \subset$ | \$ |
| Nov. | 46.3 | 70.3 | 32.55 |
| Doc. | 46,3 | 70.5 | 32,64 |
| Jan. | 39.6 | 70.0 | 27.72 |
| Feb | 45.4 | 70.1 | 31.83 |
| liar. | 45.8 | 70.1 | 32.11 |

The moderate variations in the hourly rates shown in Column 2 in this table are due in the main, to fluctuations in the amounts of overtime: however, the changes in the industrial distribution of workers in recent months already referred to, no doubt also had an effect upon the averafe hourly earnings.

The relatively slight changes in the average hourly earnings indicated in manufacturing, as a whole in the short period of observation may be due to some extent to the Government's wartime control of wage rates. In many of the industries listed in the table on page 4, however, the fluctuations have been rather more markod. As was explained in the last bullotin on man-hours and hourly earnings. such variations in the average hourly earnings in individual cases are attributed to the employnent of larger or smaller numbers of craftsmen at different rates of pay in the piven pay period. Another important. factor of course is the amount of overtime worked in the plant, or in different departments of the factory.

The average hourly earnings in the various industries for which data are published on page 4 show considerable diversity; this obviously results from several factors among which may be mentioned the degree of skill generally required of workers in the industry. the sex and age distributions of the persons employed therein, and the amount of overtime or of broken time worked, The highest rates, in general: are indicated in the production of durable ranulactured poods. in which the avorape was $77.8 \&$ per hour at liar. 1 and also at Feb. 1 . The averages in this proup of industries viere in most cases considerably above those reportea in the production of non-durable manufactured foods, where the employment of women is usually a factor of much greater importance, Within the industries engaged in the protuction of durable manufactured goods, the lowest avorages at the date undor review were those of $60.6 \notin$ in lumber procucts and $63.7 q$ per hour in clay, plass and stone products, while the high fifures were those of $86.4 \not \subset$ in steel shipbuilding und $94 ;$ in automobile and parts manufacturing.

In the case of the lipht manufactured poods industries, the range was somewhat preater, a fact which is also associated with variations in the sex distribution. Thus, in the textile industries, where the rajority of employees are females, the hourly earnings are relatively low, the general average therein being $50.5 \not \subset$ at Mar。 $1_{p}$ while in the beverage division, (in which wonen workers at the last survey of sex distribution constituted little more than one-fifth of the
reported employees), the hourly earnings were comparatively high, at $66 \%$ per hour. In the petroleum products industry, the average of over $84 \%$ per hour was considerably in excess of the average in manulacturing as a whole; in this industry, also, the proportion of female workers is small.

The variations in the average hours worked are relatively slight. In manufacturing as a whole, the average hours worked per week rose from 45.4 at Feb. l to 45.8 at liar. 1 . The lowest averaces of hours worked at liar. 1 . were those of 40.1 hours in the production of chocolate and cocoa and 40.7 in garments and personal furnishings. At the other end of the scale, come the averages of 50 hours in pulp and paper, and 50.4 hours in firearm manufacturing.

The table on page 4 contains statistics for a relatively small number of non-manufacturinf, industries, namely, mining, huilding, and highway construction. Among these industries, the earnings in hishway construction and in the production of non metallic minerals, except coal, tend to be relatively low, while those in building, coal and metallic ore mining are relatively high.

The following table gives a comparison of the average weekly wages paid hourlywrated employees with the weakly salaries and wages raported at the same dates for all persons employed by the cowoperating establishments.

|  | All Manufacturing <br> Average Weekly |  | Durable Manufactured Goods <br> Average Weokly |  | Non-Durablo Manu-actured Goods <br> Average Weekly |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Wages | Salaries and Nages | Wages | Salaries and Wages | Wages | Salaries and Wages |
| Nov. 1 | \$32.55 | \$33.13 | \$36.52 | \$36, 67 | \$27.23 | \$28.99 |
| Dec. 1 | 32.64 | 33.29 | 36.54 | 36, 83 | \|27.48 | 29.23 |
| Jan. 1 | 27.72 | 30.11 | 30.61 | 32,77 | 24,06 | 27.05 |
| Feb。1 | 31.83 | 32,98 | 35,79 | 36.44 | 26.95 | 29.06 |
| Mar.l | 32.11 | 33,50 | 36.18 | 37.04 | 27.14 | 29,47 |

It is interesting to note that a much freater similurity is found in the weekly averazes in the case of the durable goods industries than in the non durable manufactured goods industries. At Mar. $l_{\text {, the weekly wares of hourly-rated employees }}$ in the heavy manufacturing industries were $\$ 36.18$. only 86 cents lower than the average weekly salaries and wages of all workers reported in the croup at the same date. In the non-durable goods industries, the indicated salaries and wages averaged $\$ 29.47$, exceeding by $\$ 2.33$ the averape of $\$ 27.14$ resulting from the multiplication of the average number of hours worked by the average hourly earnings. The generally larger size of the individual estalilishments in the former division contributes to this situation, the earnings of the supervisory staff, salesmen, etco, constituting a smaller proportion of the total waroubill in the case of the larcor establishnents than in the case of the much more numerous but smaller establishments classified in the production of non-durable manufactured roods. Another factor lies in the fact that employers in the latter quite frequently do not maintain a record of hours worked by their piece-workers; it is also claimed that piece-workers. in general, are paid at higher rates than hourly-rated employees.

Averago Hours Forked and Average Homrly and Weekly Fmrainge of the Wafe-Farmars in cunada for wliom Statistics of Men-hours are Avallable t Jan. 1, Fob. 1 and Mar. 1,1945 , and Number of Nage-Earnerg for wom Man-hour Deta wore Avallable at the latost date
