9. By Cities, Aug. 1, 1945 - Aug. 1, 1949 ..... 19

Wage-Barners. - Employers are asked to furnish monthly statistice on manhours on behalf of those wage-earners for whom they keop a record of aggregate hours worked, so that the data relate, in the main, to persons employed at hourly rates. Information for salaried employees is purposely excluded, while in many cases, statistics of man-hours are not available for certain classes of wage-aarners, whose earnings, like those of most salaried employees, are not directly dependent upon the number of hours worked; examples of mage neamers frequently excluded are route drivers. piece-workers in many but not all establishments, truck men, etc. In addition, some employers do not keep a record of man-hours for any classes of employees. Accordingly, the number of workers for whom statistics are given in the present bulletin is smaller than the total number of employees, (salaried personnel and wage-arners) for whom statistics of employment and payrolls are obtained in the monthly surveys on these subjects; the results of these surveys are publishedin the monthly bulletins on employment and payrolls, which also contain data relating to the sex distribution of the workers in recorded employment, an important factor contributing to differences shown in the average earnings in various industries。

The monthly statistics of average hours and average hourly earnings, like those of employment and average weokly earnings relate, in the main, to establishments usually employing 15 persons and over, the smaller firms being excluded for reasons of economy in terms of cost and time. In the case of the manufacturing industries, (largely represented in the material of the present builetin), the statistics relate to over 75 p.c. of all salaried employees and wageoearners reported by the establishmenta comoperating in the monthly surveys of employment and payrolls; at the date of the last Doconnial Consus, (June 1, 1941), the manufacturers furnishing monthly data employed approximately 93 poco of all persons enumerated as at work in manufacturing.

In mining and construction, data on hours and earnings are currently avallable for some 85 poc . and 83 poce , of the total employees reported to the monthly surveys of employment and payrolls in those industries, respectively; at June 1,1941 , the co-operating mine operators had employed over 96 p.c. of all wage-earners at work as enumerated in the Census, while the employers in construction whose statistics were then recelved had reported over 79 p.c. of the Census total of employees at work in that group. It should be noted that the comparisons with the consus figures are complicated by differences in the classifications used in compiling the two series, so thet the percentages of coverage are only approximate.

Man-Hourso- The statistics of man-hours include overtime as well as the hours worked by partatime and casual workers. Hours credited to persons absent on leave with pay in the recorded pay period are included in the statistics as though the hours for which payment was made had been worked.

Wages. - The wages reported represent gross earnings before deductions are made for taxes, unemployment insuramee, etc. they do not, however, include the valu of board and lodging which in some cases is part of the remuneration of workers. Incentive and production bonuses and overtime payments are included, as are sums paid employees absent on leave with pay during the pay period for which statistics are giver. The figures of average weekly wages result from the multiplication of the average hours worked during the period of observation, by the average hourly earnings reported in the same period.

Pay Periods. - Statistics of manchours and hourly wages reported for periods exceeding one week in duration are reduced by the appropriate proportions to obtain for tabulation purposes the number of hours worked and the hourly eamings in ane week in the indicated pay period; such information is then added to the data furnished by employers who pay on a weekly basis, so that, in all cases, the tabulated data represent the situation in one week in each month.

STATISTICS OF MAN-HOTRS, HOTRLY EARMINGS MND TEEKLY WAGES AS REPORTED BY LEADING EMFLOMER AT MUG。2, 1949。

$$
\underline{\text { SIMMARY }}
$$

Partly due to the effect of vacations, the aggregate hours reported by leading mamhoturing establishments in the week of Aug. I declined by 1.3 p.c. as compared with the week preceding Julv 1, when the situation in quebec had been affected by the celebration of St. Jean Baptiste Day. The number of their wage-earners fell by 1.4 p.c.. while the average working week increased by one-ntenth of an hour during the period under review. Among the major non-manufacturing industries for which statistics are available, mining showed an increase of 4.2 poc. in the aggregate hours worked in leading establishments, largely as a result of the settlement of labour disputes in the asbestos mines of Quebec. There was a decline of 0.2 p.c. in the total of hours worked by wage-earners on the staffs of the co-operating electric railways and other local transportation companies, accompanied by a decrease of $0.3 \mathrm{p} . \mathrm{c}$. in the number of their wage-earners, so that, on the average, there was a slightly longer working week in this division. In building construction, the aggregate hours of work reported by leading firms increased by 8.1 p.c., while the number of wage oarners for whom data were furnished rose by 3.3 poc. The average working period was 40.9 hours in the week of Aug, 1, compared with 39.1 hours for the week preceding Julv 1. In the service industries included in the survey, the aggregate hours reported increased by 0.7 poc.e and the number of wage-earners by 1.1 p.c. The average working week was one-tenth of an hour shorter.

The total wages distributed by manufacturing firms for the week preceding Aug. I declined by 1.5 p.c. as compared with the same period one month earlier; the average hourly eamings in this period fell by one-ifth of a cent. The average hourly earnings based on data furnished by mining operators declined by three-tenths of a cent, although the total wages reported were 3.8 p.c. higher than one month earlier. Largely as a result of wage increases in some centres, the aggregate payrolls of wage-earners emploved by the co-operating electric railways and other local transm portation companies rose by 2.1 p.c. The average hourly earnings of their employees were 2.4 cents higher than at July 1 . The acgregate wares paid by the reporting building contractors increased by $7.5 \mathrm{p} . \mathrm{co}_{0}$, but the average hourly earnings of their emplovees fell from 107.2 cents at July 1 to 106.6 cents at Aug. 1 . In the service industries for which data are tabulated, there was a small fractional decline in the reported wages, together with a loss of five-tenths of a cerit in the average hourly oarnings in the month.

## Manufacturing.

Average Hours worked. - The average hours of work reported bv the leading anafacturing establishments for their wage-earners were at huf. 1 one-tenth of an hour nigher than during the week of Julv 1, when the celebration of St. Jean Baptiste Day a: a holiday in Quebec had tended to lower the hours worked in some industries. The average hours of work in the durable goods industries were two fifths of an hour less than in the week preceding July 1. In this proup, the reported aggregate of hours worked in the period under review declined by 2.4 p.c., while the number of wageearners decreased by 1.5 p.c. Among the factors contributine to the reductions were vacations and extremely hot weather in some areas. The working weck in the iron and steel group showed a decline of seven-tenths of an hour, the latest average being 42.2 hours. Decreases were also renorted be films manufacturing other durable goois, With the exception of noneferrous metal and clay, glass and stone products. In the lignt manufactured goods aivision, tho inuicuica iotal of nours increased by 0.1 p.c. as compared with the week of July l, wile the average working week rose from 41.2 hours to 41.7 hours in the week of sug. 1. In establishments manufacturing textile

A11 Manufacturing
Durable Manufactured Goods
Non-Durable Manufactured Goods
and leather products, the working time was slightiy over one hour longer than in the week of July l, when the situation in theso and other incustries in quebec had been affected by the observance of the St. Jean Baptiste holiday.

Hourly Earnings - The hourly earnings reported by the larger manufacturing establishrents at Aug. 1 declined by onowfifth of a cent from the ali-time maximum figure of 99.1 cents, recorded at June 1 and July 1 of the present vear. Nage-rates showed further increases in the primary iron and steel and certain other industries. Shorter working hours in the relatively hiphly-paid durable goods industries, together with lower production bonuses during the vacation period, the emplorment of larger numbers of relatively unskilled seasonal workers and other factors, however, offset the effect of these increases, producing the first decline in the average hourly earnings indicated since Mar. 1, 1946. In the heavy manufacturing industries, the earnings reported at Aup, 1 averaged 106.6 cents, one-tenth of a cent below the July 1 maximum for the year, at 106.7 cents. The aggregate wages decreased by 2.4 p.c. in the same period. Nithin this division, a decline in average hourly eurnings was reported by firms engeged in the manufacturing of lumer products and clay, glass and stone products.

The average hourly earnings reported in the non-durable manufacturing industrias as a whole fell by one-fifth of a cent in the period under review, when the aggregate wages paid declined by 0.3 poc. as compared with the week of July 1 . Losses were indicated in most of the major industries in this division, the exception being textiles in which no general change was noted, and the edible animal and chemicals products groups, in which the average hourly earnings were slightly higher. The decreases in the remaining industries mere small.

Average Weekly Wages.- At Ang, 1, the weekly wages of hourly-rated wage-earners emploved br leading manufacturing establishments averaged $\$ 41.44$, compared with $\$ 41.42$ at July 1, and \$39.03 at Augo 1, 1948. In the heaver manufactured goods industries, the average weekly wages, at $\$ 44.7 \%$, were 47 cents below the figure for one month earlier; the decline was mainly due to shorter working time, particularly in the iron and steel group. Tho average weekly wages in the non-durable goods division rose by 37 cents in the period under review, bringing the latest figure to $\$ 37.99$, the increases resulting from longer working hours.

Table 8 gives a comparison of the average weekly salaries and wages reported monthly by leading manufacturers since August 1, 1945, together with the average weekly wages paid the wage-earners for whom they keep a record of hours worked. The former figures include wage-earners paid by the hour and those paid at other rates, (such as piece-workers, etc.), as well as workers paid by salary and commissions. On the whole, however, the wage-earners for whom statistics are given in the present bulletin, as shown in Table 3, form important proportions of the total personnel of the co-operating establishments. At the beginning of August, such emplovees made up $74.4 \mathrm{p} . \mathrm{c}$. of, the total number of persons of all categories on the parrolls of the manufacturers 1 / furnishing monthly statistics on emploment and payrolls at the same date; in the heavy manufactured goods industries, the ratio was $77.5 \mathrm{p}, \mathrm{c}_{0}$, and that in the light manuPactured goods division, 71.5 p.c.

The high proportions which the hourly-rated wage-earners constitute of the total emnlovees of the co-operating establishments lend interest to the data in Table 8. In the period under review, the average weokly salaries-and-wages figure for manufactiring industries taken as a whole dropped by two cents, while the average wookly wages increased ber a similar amount in the same comparison. In the heavy coods industries,
$\overline{1}$ That is, of establishments ordinarily employing 15 persons and over. See the monthly bulletins on Employnent and Payrolls. It is estimated that the salaried personnel in manufacturing as a whole usually make up 16 p.c. to 17 p.c. of the total number of emplovees. Attention is called to the explanatory notes facing the first page of this bulletin.
the combined salaries-and-wages figure declined by 33 cents, as compared with a drop of 47 cents a week in the wages of the hourly-rated personnel. Although a rise in the average salaries-and-wages figure and in the average weekly wage was indicated in the non-durable manufactured goods industries, the advance of 37 cents in the latter: figure was slightly greater than that of 25 cents a week in the average weekly salaries and wages combined.

> 2. Non-lianufacturing Industries.

In many of the non-manufacturing industries, few if any of the wage-earners are paid by the hour, with the result that a precise record of the hours worked is not kept. The representation of the non-manufacturing industries in this bulletin is therefore less than that in the manufacturing classes. The following notes deal briefly with the statistics for several of the non-manufacturing classes.

The average hourly earnings of the reported wage-aarners in the coal mining industry, at 127.4 cents, in the week preceding Aug. 1, were higher than they have been since Mar. 1, 1949. At the same time, the average hours worked by the miners increased from 37.8 hours at July 1, to 39 hours at Aug. I, while the average weakly wages were \$2. 14 higher. Wage increases were reported by operators in some areas, and there was rather greater emploment for the more highly skilled workers. In the week of Aug. 1 , there were declines in the aggregate and average hours worked and in the average hourly earnings reported by companies engaged in the extraction of metallic ores. The average working week in this industry was half an hour shorter, while the average hourly earnings fell from 116.0 cents at July 1 to 115.8 cents at the dato under review. Largely as a result of the settlement of the labour-managernent dispute in the Quebec asbestos mines, the average hours reported in the non-metallic mining group were higher in the week of Aug. 1. The average hours worked rose by 1.2 hours in the month; with the increase in the number of wagemearners, however, the average hourly earnings declined by 1.1 cents, to 101.9 cents. This figure was similar to that indicated before the industrial dispute comenced in the vinter.

The average hours worked at Aug. 1 in the local transportation group showed very little increase over those at July l, but the average hourly earnings, at 101.9 cents, were 2.4 cents higher, the latest figure being the maximum in the record. At Aug. 1, 1948, the average hourly earnings for the group vere 95.1 cents. With a further seasonal increase in the number of wage-earners engaged in building construction, the average hours worked in the industry were 1.8 hours higher at Aug. 1 than one month earlier; the average hourly earnings, however, declined by 0.6 cents, to 106.6 cents per hour. While the average hours worked in this industry were practically the same as one vear earlier, the average hourly earnings had increased by five cents an hour. Highway construction showed seasonal expansion the number of wage-earners for whom man-hours data are recorded increased by 3.6 poco at Augo 1 as compared with July 1 . In this period, the average hours worked rose by fourwfifths of an hour, to reach 40.7 hours, but the average hourly earnings, at 84.5 cents, were 0.1 cents lower than one month earlier. At Aug. 1, 1948, an average of 35.8 hours was reported for wage $\cdots a r n e: s$ in this industry, who received an average of 77.5 conts per hour. With seasonal increases in emploment in sumer resorts, the number of wage-earners reported b. the co-operating hotels and restaurants at Aug. 1 were two p.c. greater than in the preceding month. The average hours worked by these wage-earners was unchanced. the reporting laundries and dry-cleaning establishments, the averago hours worked were three-fifths of an hour shorter than in the week of July 1, while the average hourly earnings declined by one half a cent.

## 3. Provincial Statistios for Leading Industries.

With the exception of New Brunswick and Quebec, the general averages of hours worked in leading manufacturing establishments were shorter in all provinces in the week of Aug. 1 than one month earlier. The average per weok in New Brunswick increased
from 44.4 to 45 hours in the period under review, a result of greater activity in fish and food processing plants and lumber mills. The working week in manufacturing plants in Quebec rose by nine-tenths of an hour over the week of July l, when the situation mad been affected hy the observance of the St. Jean Baptiste holiday; the termination of labour disputes in the asbestos industry resulted in an advance of over four hours in the average working time in non-metallic mineral mining. In British Columbia, the average working week in manufacturing declined by six-tenths of an hour, largely because of the shorter hours reported in the lumber products industry. The average hours in ilberta fell from 42.4 hours in the week of July 1 to 41.5 hours in the period under review, with shorter time reported in most of the major manufacturing groups. The annual vacation period tended to lower the hours in many industries in all provinces. As compared with one vear earlier, the average working time at aug. 1, 1949, was longer in New Brunswick, Ontario, Manitoba and Saskatchewan。 A shorter working week was reported in the remaining provinces, the declines varying from 1.3 hours in Nova Scotia, to one-tenth of an hour in Eritish Columbia.

The average hourly earnings in manufacturing as a wholo showod an increase at Aug. 1 as compared with July 1 in Nova Scotia, Ontario, Manitoba and Saskatchewan. The largest gains were reported by firms in Nova Scotia, where there was an increase of 1.9 cents over the previous month; this increase was a result of incroases in wagerates in primary iron and steel. Largely because of seasonal changes in the level of activity in the food processing groups, the average hourly earnings in Saskatchewan increased from 100.4 cents at July 1 to 101.5 cents at the beginning of August. The general averages reported by manufacturing firms in Manitoba and Ontario were higher by four-tenths and threo-tenths of a cent respectively, at the latter date. In Manitoba, seasonal increases in the number of wage-earners and the hours reported in the meat packing industry in which wages are above the level of manufacturing as a whole, were partly responsible for the general increase. In Ontario, substantial reductions in the number of lower-paid seasonal wage-earners in canning factories tended to raise the average hourly earnings in manufacturing as a whole.

Among the provinces in which the trend of average earnings was downward, the most marked decrease was that of nine-tenths of a cent in quebec, where there were fairly general though small lossos in most of the major manufacturing industries with the exception of textile plants and non-ferrous metal products. Marked increases in the number of hours worked in the lumber products, fruit and vegetable canning and textile industries, where rates are below the general level, together with shorter working hours in the more highly-paid eloctrical apparatus and iron-and steel-using establishments, tended to reduce the average hourly earnings in manufacturing as a whole in this province. In New Brunswick, longer hours worked by seasonal wage-earners in the fish packing and lumber products industries resulted in a decline of eighttenths of a cent in the general average of hourly earnings of wage-earners in manufacturing. The annual vacation period in many factories affected the average earnings in some instances in all provinces in the period under review. In spite of small decilnes Crom July 1 in the average earnings in the week preceding Augo 1, the latest figures as shown on the table on page 2, were considerably higher in all provinces than those reported a year earlier. In studving these comparisons, it should bo kept in mind that the industrial and related sex distributions of the wage-earners reported by leading firms in the various provinces have an important influence on the differences shown in the amounts by which the hourly earmings in manufacturing as a whole have risen in the period of observation.

> 4. Statistics for the Larger Cities.

Table 7 gives data on man-hours and hourly earnings in leading manufacturing establishments in five of the larger cities. On the whole longer average hours were worked at $\Lambda u g$. 1 by wage-oarners in Montreal, where the average in the week preceding July 1 was below normal, largely due to the observance of the St. Jean Baptiste holiday.

In the remaining centres, the working time was lower. The averape hours worked by wage-oarners in Hamilton decline by one hour, mainly the result of shorter working time in the iron and steel group, where partial resumption of operutions following an industrial dispute tended to lower the average. The average hours \%orled in the reporting establishments in Toronto and Vancouver were two-fifths of an hour shorter, while the situation in Winnipeg remained unchanged.

The averace hourly earnings reported by mamfacturing establismonts were highe: at Nug. I than at Julv 1 in Hamilton and Winnipeg; the increase in the Fomer citer amounted to 0.5 cents, and that in the $l$ 纤er, to 0.3 cents. There was a decline of 0.9 cents in the average hourly earnings of wagemearners in manufacturing genorally in Montreal; many of the major manufacturing industries contributed to the reduction, which partly resulted from shorter working hours in industries in which the omployees received enmings above the general level. There were declines of 0,2 cents and O.l cents in Toronto and Vancouver, respectivelv, as compared with July $l_{0}$

The advances in the everage hourlv rates in the larger cities at Aug. 1 as compared with the same date in earlier vars, as shown in Table 5, were considerable. As was mentioned in connection with the provincial averages, it is important to note that the variations in the average rates in manufacturing as a whole in the cities are due, in part, to differences in the industrial distributions of the wafe earners for whom statistics are available. The related sex distributions of the wage-earners reported by leading establishments in the various provinces and cities also have an important influence on the differences in the amounts by which the hourly earnings in manufacturinc as a whole have risen in comparison with a year ago, or with oarlier years.
 Wel comparative Pigures for July 1,1948 and Aug. $1,1948$.
