ESTIMATES OF LABOUR INCOME

October 1957

The total of wages, salaries, and supplementary forms of labour income paid to residents of Canada in October is estimated at \$1,342 million. This compares with a (revised) total for the previous month of \$1,345 million, and a total for October 1956 of \$1,273 million. The increase over October of last year is estimated at about $5\frac{1}{2}$ p.c.

The primary industry group was the only one which registered a decline in the twelve-month comparison, about 6 p.c. Manufacturing and construction were both up by about 2 p.c., the distributive group by about 7 p.c., and the finance and services group by about 14 p.c.

When allowance is made for seasonal factors the resulting "deseasonalized" estimate of total labour income shows approximately no change from September to October. The preliminary October figure is \$1,298 million.

For purposes of comparison, it may be noted that average weekly earnings in major non-agricultural industries had risen 4.2 p.c., from \$66.07 at October 1, 1956, to \$63.35 at October 1, of this year. Over the same period, the average number of hours worked in manufacturing industries fell from 41.5 to 40.7. The November 1 consumer price index was 123.3 (1949=100), representing a 2.5 p.c. increase over the index level at the same date a year ago (120.3).

Notes on Estimates of Labour Income

Estimates of total labour income comprise all wages, salaries and supplementary remuneration for employees' services. Gross earnings—before deductions for income tax, unemployment insurance and pension contributions—are used in the calculation of total wages and salaries, which include bonuses and commissions as well as free room and board provided by the employer. Employers' contribution to unemployment insurance, workmen's compensation, pensions and welfare are shown as supplementary labour income.

The monthly estimates of total wages and salaries are projections from annual estimates, mainly on indexes of aggregate payrolls for major industrial groups along with various employment and wage rate data. A constant number of working days in each month is assumed in the estimation of labour income. A detailed account of the concepts and methods is set out in the report "National Accounts, Income and Expenditure by Quarters 1947-1952" (November 1953).

The annual estimates of labour income are compiled from basic sources within the Bureau and from other reports of governments and business. Labour income constituted 62 per cent of net national income at factor cost in 1956. The relationship between labour income and other items of the national accounts are shown in the bulletin "National Accounts, Income and Expenditure, 1950-1956" (May 1957).

Seasonally Adjusted Estimates of Labour Income (\$ Millions)

	1954	1955	1956	1957
