## ESTIMATES OF LABOUR INCOME

December 1957

It is estimated on the basis of preliminary information that the total of wages, salaries, and supplementary forms of labour income amounted to \$1,288 million in the month of December. A drop of \$28 million from November to December can be explained partly by reference to seasonal factors. However, when allowance has been made for these the resulting "seasonally adjusted" estimate of \$1,282 million still represents a fall of \$6 million from the similarly adjusted estimate for the previous month. Thus the downward trend evident in the previous two or three months continued into December.

An examination of the industrial components of the total labour income estimate indicates that the overall drop was rather widely distributed, with all of the five major groups registering decreases. Construction was off by about 14 p.c., largely, but not entirely, owing to seasonal influences. Primary industries fell by 4 or 5 p.c., partly a result of the continued, though less rapid, decline in forestry (apart from seasonal movement). Other industrial groups displayed more moderate rates of decrease.

Estimates of employment in major non-agricultural industries are consistent with changes in income. By late November the industrial composite index was lower than at the same date a year ago in nine of the ten provinces (Saskatchewan was the exception). The seasonally adjusted employment index for Canada continued to fall from late October to late November. The average of industrial weekly earnings was higher by 4.7 p.c. in late November than at the same date in 1956. On the other hand, the average number of hours worked in manufacturing (for which this information is available) fell from 41.5 to 40.6, a drop of 2.2 p.c.

A comparison of the annual 1957 total (\$15,348 million) with that for 1956 (\$14,284 million) indicates an increase of 7.4 p.c. This compares with a 1955-56 increase of 11.4 p.c.

# Notes on Estimates of Labour Income

Estimates of total labour income comprise all wages, salaries and supplementary remuneration for employees' services. Gross earnings—before deductions for income tax, unemployment insurance and pension contributions—are used in the calculation of total wages and salaries, which include bonuses and commissions as well as free room and board provided by the employer. Employers' contribution to unemployment insurance, workmen's compensation, pensions and welfare are shown as supplementary labour income.

The monthly estimates of total wages and salaries are projections from annual estimates, mainly on indexes of aggregate payrolls for major industrial groups along with various employment and wage rate data. A constant number of working days in each month is assumed in the estimation of labour income. A detailed account of the concepts and methods is set out in the report "National Accounts, Income and Expenditure by Quarters 1947-1952" (November 1953).

The annual estimates of labour income are compiled from basic sources within the Bureau and from other reports of governments and business. Labour income constituted 62 per cent of net national income at factor cost in 1956. The relationships between labour income and other items of the national accounts are shown in the bulletin "National Accounts, Income and Expenditure, 1950-1956" (May 1957).

## Seasonally Adjusted Estimates of Labour Income (\$ Millions)

	<u>1954</u>	<u>1955</u>	<u>1956</u>	<u>1957</u>
January	983	1,025	1,123	1,247
