ESTIMATES OF LABOUR INCOME

June 1958

The total of labour income received by residents of Canada in June is estimated at \$1,350 million, an advance over the previous month of \$35 million or a little under three percent. As usual at this time of year seasonal factors were important and their effects were widely diffused throughout the economy, though particularly noticeable in forestry and the construction industry. However, when adjustments are made to remove the effects of these factors the resulting "deseasonalized" estimate (\$1,310 million) indicates a decrease since May of about \$6 million or roughly a half of one percent. This decrease represents a reversal of the upward trend evident in the seasonally adjusted series during the preceding three months. A number of major industries contributed to the over-all decline.

In spite of the drop in seasonally adjusted labour income the June total (unadjusted) was higher than a year ago by \$28 million or about two percent. With employment lower in a number of important industries this rise can be attributed mainly to higher wage rates. In the major non-agricultural group as a whole average weekly earnings advanced over the year by roughly \$2.30 or 3.3 p.c., while in manufacturing the increase was approximately \$2.80 per week or 4.0 p.c. These increases compare with a rise in the consumer price index of 2.9 p.c. over the same twelve-month period.

Notes on Estimates of Labour Income

Estimates of total labour income comprise all wages, salaries and supplementary remuneration for employees' services. Gross earnings—before deductions for income tax, unemployment insurance and pension contributions—are used in the calculation of total wages and salaries, which include bonuses and commissions as well as free room and board provided by the employer. Employers' contribution to unemployment insurance, workmen's compensation, pensions and welfare are shown as supplementary labour income.

The monthly estimates of total wages and salaries are projections from annual estimates, mainly on indexes of aggregate payrolls for major industrial groups along with various employment and wage rate data. A constant number of working days in each month is assumed in the estimation of labour income. A detailed account of the concepts and methods is set out in the report "National Accounts, Income and Expenditure by Quarters 1947-1952" (November 1953).

The annual estimates of labour income are compiled from basic sources within the Bureau and from other reports of governments and business. Labour income constituted 62 per cent of net national income at factor cost in 1956. The relationships between labour income and other items of the national accounts are shown in the bulletin "National Accounts, Income and Expenditure, 1950-1956" (May 1957).
