Includes retroactive wage payments to railway system employees.
All totals are rounded to the nearest million independently. Therefore, the final total does not necessarily agree with the sum of the individual estimates.

ESTIMATES OF LABOUR INCOME

NOVEMBER, 1949

Labour income for the month of November is estimated to be \$661 million. This figure is \$2 million lower than last month but higher by \$29 million or about 5 per cent than the November, 1948 estimate.

Lower employment in agriculture and construction was responsible for smaller labour income totals in these industries. Practically all the industries within the group "transportation, communication, and storage" recorded decreases and manufacturing was also lower by \$1 million. Partly counterbalancing these losses were gains in trade and forestry. Although forestry showed a normal seasonal increase, it was considerably below the corresponding monthly total for 1948.

Increased retail trade activity was chiefly responsible for larger income payments in the trade industry. The total service group recorded a gain of over \$1 million above the October figure.

A slight decrease from 132.9 on November 1 to 132.6 on December 1 took place in the index of employment in the nine leading non-agricultural industries. Average weekly earnings for the same group of industries advanced from \$43.69 to \$43.72 over the same period. At the same time a small decline of 0.5 to 161.7 occurred in the Dominion cost-of-living index.

The Chart

The chart on the front of the publication shows the annual totals of wages, salaries and supplementary labour income by months for 1946, 1947 and 1948, as well as the cumulative total to date in 1949. The annual totals can be measured against the scale on the left side of the chart. The monthly trend is plotted according to the scale on the right side of the chart and shows the menth-to-menth changes in the totals over the whole period.

Methods

The monthly estimates are obtained from annual estimates by projection on indexes of month-to-month changes in salaries and wages in each industry and, where necessary, monthly indexes of supplementary labour income. In the major sectors the monthly indexes used are the indexes of "Aggregate Payrolls" published in the D.B.S. Bulletins on Employment and Payrolls. In a number of sectors where no suitable indexes of payrolls are available, data relating to changing numbers on employees from the quarterly Labour Force Survey are used in conjunction with a variety of wage-rate information to provide an index of payrolls. A constant number of working days in each month is assumed in the estimation of monthly labour income figures. A full description of the concepts, methods and quality of the monthly estimates is set forth in the Bulletin "Wages, Salaries and Supplementary Labour Income in Canada by Months, January, 1946 to April, 1947." The method of adjusting the estimates to the annual totals is outlined in "Monthly Estimates of Labour Income in Canada, September, 1949."

Relation to the National Accounts

Labour income constituted about 56 per cent of "Net National Income at Factor Cost" in 1948. The relationship between labour income and other items of the National Accounts can be studied in the bulletin "National Accounts, Income and Expenditure, 1941-48."

Components of Labour Income

Estimates of labour income include all wages, salaries and supplementary remuneration for employees' services. Salaries and wages include bonuses and commissions and are reckened before deductions for income tax or any other payments. Supplementary labour income consists of all other employers' expenditures in cash or in kind that can be regarded as compensation for the employees' services. Examples of the latter are: employers' contributions to Unemployment Insurance: clothing and living accommodation or cash allowance for these provided by employers and other benefits.
