* Includes retroactive wage payments to railway system employees.
All totals are rounded to the nearest million independently. Therefore,
the final total does not necessarily agree with the sum of the individual
estimates.

ESTIMATES OF LABOUR INCOMEAPRIL, 1950

The April total of labour income is estimated to be \$642 million. This figure is \$9 million higher than the March estimate and \$32 million or 5 per cent higher than the April, 1949 total.

Seasonal influences affected the rise between March and April. With the commencement of the navigation season, employment in water transportation showed a rise which was reflected in a larger labour income total in this industry. Construction was higher by \$2 million, indicating increased industrial activity. A sharp seasonal decline in logging employment was chiefly responsible for decreased labour income in this field.

Total industrial employment was moderately higher; the index of employment in 9 leading non-agricultural industries advanced from 124.1 on April 1 to 124.7 on May 1. Average weekly earnings increased from \$44.77 on April 1 to \$44.88 on May 1. A fractional change from 163.7 on March 1 to 164.0 on April 1 occurred in the Dominion cost-of-living index.

The Chart

The chart on the front of the publication shows the annual totals of wages, salaries and supplementary labour income by months for 1946, 1947, 1948 and 1949, as well as the cumulative total to date in 1950. The annual totals **can** be measured against the scale on the left side of the chart. The monthly trend is plotted according to the scale on the right side of the chart and shows the month-to-month changes in the totals over the whole period.

Methods

The monthly estimates are obtained from annual estimates by projection on indexes of month-to-month changes in salaries and wages in each industry and, where necessary, monthly indexes of supplementary labour income. In the major sectors the monthly indexes used are the indexes of "Aggregate Payrolls" published in the D.B.S. Bulletins on Employment and Payrolls. In a number of sectors where no suitable indexes of payrolls are available, data relating to changing numbers of employees from the quarterly Labour Force Survey are used in conjunction with a variety of wage-rate information to provide an index of payrolls. A constant number of working days in each month is assumed in the estimation of monthly labour income figures. A full description of the concepts, methods and quality of the monthly estimates is set forth in the Bulletin "Wages, Salaries and Supplementary Labour Income in Canada by Months, January, 1946 to April, 1947". The method of adjusting the estimates to the annual totals is outlined in "Monthly Estimates of Labour Income in Canada, September, 1949". Minor revisions to the 1947, 1948 and 1949 monthly totals were made in August, 1949. Therefore, when dealing with these years bulletins published prior to August, 1949 should not be used. Since the 1946 monthly figures were not revised at that time, the latest figures for that year will be found in 1949 bulletins prior to the June issue.

Relation to the National Accounts

Labour income constituted about 56 per cent of "Net National Income at Factor Cost" in 1948. The relationship between labour income and other items of the National Accounts can be studied in the bulletin "National Accounts, Income and Expenditure, 1941-48".

Components of Labour Income

Estimates of labour income include all wages, salaries and supplementary remuneration for employees' services. Salaries and wages include bonuses and commissions and are reckoned before deductions for income tax or any other payments. Supplementary labour income consists of all other employers' expenditures in cash or in kind that can be regarded as compensation for the employees' services. Examples of the latter are: employers' contributions to Unemployment Insurance; clothing and living accommodation or cash allowance for these provided by employers and other benefits.
