ESTIMATES OF LABOUR INCOME

November, 1952

At \$960 million the November estimate of total wages, salaries and supplementary labour income was higher by \$9 million than for October, and showed an increase of \$88 million, or 10 per cent over November, 1951.

Gains in total wages and salaries were recorded during November for manufacturing, for the distributive group of industries and for finance and services. The increase of \$5 million in the total for manufacturing was largely attributable to the durable goods industries; and the renewed activity in retail trade chiefly accounted for the rise of \$4 million in the distributive industries. The total for finance and services also increased by \$4 million.

Total wages and salaries for primary industries were unchanged from October, with the increased activity in forestry offsetting the seasonal decline in agriculture. Construction wages and salaries contracted by \$3 million.

The November 1952 estimate of 3,946,000 paid workers, according to the labour force survey, was larger by 146,000, or 4 per cent, than the estimate for November, 1951. During this period, average weekly earnings of non-agricultural paid workers advanced from \$52.41 to \$56.08, or by 7 per cent.

The Consumer Price Index (1949=100) showed a decline from 116.1 to 115.8 between November 1 and December 1; it stood at 118.1 at December 1, 1951.

Additional information becoming available during the past month for incorporation into the estimates of labour income published in the bulletin on "National Accounts, Income and Expenditure, Preliminary 1952" has necessitated further small adjustments to the monthly figures, which were revised in the October, 1952 issue of "Labour Income".

The Chart

The upper portion of the chart on the front of this publication shows labour income (total of wages, salaries and supplementary income) by months for the years 1949, 1950, 1951 and 1952. The lower part shows the percentage changes of any month from the same month one year earlier.

Methods

For most of the major industries, the monthly estimates of labour income are obtained from annual estimates by projection on indexes of aggregate payrolls. For other industries, a variety of wage-rate and employment data is used to provide an estimating series. The annual data, on which the monthly estimates are based, are compiled from original sources within the Dominion Bureau of Statistics and from data supplied by several industrial or trade associations. No adjustment is made for different numbers of working days in each month. A more detailed description of concepts and methods is set out in the bulletin "Wages, Salaries and Supplementary Labour Income by Months, January, 1946 to April, 1947", and the method of adjusting the estimates to the annual totals is outlined in "Monthly Estimates of Labour Income in Canada, September, 1949". The figures included in the tables of this bulletin supersede those in earlier bulletins, and those for the most recent years are subject to further minor revisions as new source materials become available.

Relation to the National Accounts

Labour Income constituted 59 per cent of "Net National Income at Factor Cost" in 1952. The relationship between labour income and other items of the National Accounts can be studied in the bulletin. "National Accounts, Income and Expenditure, Preliminary 1952".

Components of Labour Income

Estimates of total labour income include all wages, salaries and supplementary remuneration for employees' services. Gross earnings—before deductions for income tax or other payments—are used in the calculation of wages and salaries, and include bonuses and commissions as well as allowances for food, clothing and living accommodation where these are provided by the employer. Employers' contribution to unemployment insurance, workmen's compensation, pensions and welfare are shown as supplementary labour income.
