Estimates of Labour Income

May, 1952

The estimate of total wages, salaries and supplementary labour income for May of \$876 million was higher by \$22 million than the April figure. This reversed a declining rate of increase in the first four months of 1952. Labour income for May was \$84 million or more than 10½ per cent greater than the total for May 1951, in spite of time losses due to industrial disputes.

May advances in total wages and salaries were indicated in all the major industrial groups. With the exception of manufacturing, percentage increases were sizable, ranging from 1.8 per cent for the utilities, transportation, communication, storage and trade group to 9.1 per cent for contract construction. Time loss from work stoppages was unusual in textile and clothing manufacturing; but in spite of this, the manufacturing total recorded a fractional gain.

The month of May was characterized by a rise in the index of non-agricultural employment (1939=100) from 177.4 at May 1 to 182.2 at June 1, and by a decline in the average weekly earnings from \$54.34 to \$54.09. Over the same period, the Dominion cost-of-living index (1935-1939=100) moved up slightly from 186.7 to 187.3.

The Chart

The upper portion of the chart on the front of this publication shows labour income (total of wages, salaries and supplementary income) by months for the years 1949, 1950, 1951 and 1952. The lower part shows the percentage changes of any month from the same month one year earlier.

Methods

income are obtained from annual estimates by projection on indexes of aggregate payrolls. For other industries, a variety of wage-rate and employment data are used to provide an estimating series. The annual data, on which the monthly estimates are based, are compiled from original sources within the Dominion Bureau of Statistics and from data supplied by several industrial or trade associations. No adjustment is made for different numbers of working days in each month. A more detailed description of concepts and methods is set out in the bulletin "Wages, Salaries and Supplementary Labour Income by Nonths, January, 1946 to April, 1947", and the method of adjusting the estimates to the annual totals is outlined in "Monthly Estimates of Labour Income in Canada, September, 1949". The figures included in the tables of this bulletin supersede those in earlier bulletins, and those for the most recent years are subject to further minor revisions as new source materials become available.

Relation to the National Accounts

Labour Income constituted 58 per cent to "Net National Income at Factor Coet" in 1950. The relationship between labour income and other items of the National Accounts can be studied in the bulletin "National Accounts, Income and Expenditures, 1926-1950".

Components of Labour Income

Estimates of total labour income included all wages, salaries and supplementary remuneration for employees' services. Gross earnings - before deductions for income tax or other payments - are used in the calculation of wages and salaries, and include bonuses and commissions as well as allowances for food, clothing and living accommodation where these are provided by the employer. Employers' contribution to unemployment insurance, workmen's compensation, pensions and welfare are shown as supplementary labour income.
