ESTIMATES OF LABOUR INCOME

SEPTEMBER, 1952

During September labour income increased by \$10 million over the previous month, reaching a total of \$932 million. This was \$84 million or 9.9 per cent higher than the level of September 1951.

The greatest gain was recorded in manufacturing where an increase of \$7 million brought the total of wages and salaries to \$314 million, a rise of \$30 million or 10.6 per cent over the corresponding month in 1951. In the primary industry group the increase of \$1 million was due to reviving activity in forestry. Increased employment in trade accounted for the gain of \$2 million in the distributive industries.

Cumulatively, total labour income for the first 9 months of 1952 at \$7,912 million was \$820 million higher than in the corresponding period of 1951. Of this 11.6 per cent rise, nearly 9½ per cent is attributable to higher average earnings and the remainder to increased employment. The greatest gain, amounting to 24.4 per cent, was registered in construction. During the third quarter of 1952 total labour income was 10 per cent higher than in the third quarter of 1951. The following table shows the percentage changes that occurred:

- (a) between the first 9 months of 1952 and the first 9 months of 1951.
- (b) between the third quarter of 1952 and the third quarter of 1951.

	Agricul- ture, Forestry, Fishing, Trapping, Mining	Manu- fac- turing	Con- struc- tion	Utilities, Trans- portation, Communi- cation, Storage, Trade	Finance, Services, (includ- ing Govern- ment)	Supple- mentary Labour Income	Total
(a)	9.8	10.1	24.4	10.5	11.7	8.7	11.6
(b)	2.9	9.4	22.5	9.0	10.7	4.7	10.0

The Consumer Price Index (1949=100) declined from 116.1 on Sept. 2 to 116.0 on Oct. 1; it stood at 117.1 on Oct. 1, 1951.

The Chart

The upper portion of the chart on the front of this publication shows labour income (total of wages, salaries and supplementary income) by months for the years 1949, 1950, 1951 and 1952. The lower part shows the percentage changes of any month from the same month one year earlier.

Methods

For most of the major industries, the monthly estimates of labour income are obtained from annual estimates by projection on indexes of aggregate payrolls. For other industries, a variety of wage-rate and employment data are used to provide an estimating series. The annual data, on which the monthly estimates are based, are compiled from original sources within the Dominion Bureau of Statistics and from data supplied by several industrial or trade associations. No adjustment is made for different numbers of working days in each month. A more detailed description of concepts and methods is set out in the bulletin "Wages, Salaries and Supplementary Labour Income by Months, January, 1946 to April, 1947", and the method of adjusting the estimates to the annual totals is outlined in "Monthly Estimates of Labour Income in Canada, September, 1949". The figures included in the tables of this bulletin supersede those in earlier bulletins, and those for the most recent years are subject to further minor revisions as new source materials become available.

Relation to the National Accounts

Labour Income constituted 58 per cent to "Net National Income at Factor Cost" in 1950. The relationship between labour income and other items of the National Accounts can be studied in the bulletin "National Accounts, Income and Expenditures, 1926-1950".

Components of Labour Income

Estimates of total labour income included all wages, salaries and supplementary remuneration for employees' services. Gross earnings - before deductions for income tax or other payments - are used in the calculation of wages and salaries, and include bonuses and commissions as well as allowances for food, clothing and living accommodation where these are provided by the employer. Employers' contribution to unemployment insurance, workmen's compensation, pensions and welfare are shown as supplementary labour income.
