Sumary Statistice of Epploment and Peyrolis an Reported by Eetablishmemes in the Leading Industrial Oroups, Oumteriy, From Sept. 1, igil, to Dec. 1, 1942..

the average employment theavy curve is based upon the number of persons employed at the first day of the month by the firms reporting, compared with year 1926 as 100 . The broken curve shows this crude curve corrected for seasonal variation as तetermined by the experience of the years 1929-1937.

# DEPARTMENT OF TRADE AND COMMERCE DOMINION BUREAU OF STATISTICS <br> OTTANA - CANADA 

Dominion Statiftician $\quad$ S.A. Cudmore, N.A. (oxon.),F.S.S., F.R.S.C. In Charge Fmploymont and Payroll Statistiosi M. E. K. Roughsedgo.

PART 1
GENERALSUKMARY.

In oontinuing response to the stimulus provided by the industrial war effort, employment reached unprooedentedly high levels in Canada during 1942. The trond was generally favourable during nine of the twelve months, ourtallmont having beon indioated only during the firgt quarter of the yoar; the oontraotions then were moderate. The oxtent of the general upswing, however, wa not equal to that reported in the earlier phasen of the oxpansive movement. whioh, dating from the outbreak of hostilities, had reoeived great impetus from the events of the spring and oarly summer of 1940, elimaxed by the oollape of Franoe. This lowing down in the rate of aooeleration during 1942 was an obvious developmont in viow of the magitude of the oxpansion sino the beginning of the war, with its oonsequent dopletion of the labour market, seriously affeoted also by the reoruitment of some 600,000 persons by the armed foroes. In the 1942 stage of the war, the distribution of the workers taken on differed from that indicatod in prooeding phases. As shortages of labour and materials beoane inoreasingly a problem in industrial organiestion, the shift of worker: from the lossesontial to the more-ossential production and sorvioes asumed an ever-growing importano in the industrial pattorn - transfer which in general wa faoilitatod by relatively high earnings in war plants and other essontial induatries.

The employers whes returns were inoluded in the Dominion Bureau of Statistio (ourrent survey of omployment and payrolis in 1942 numbered 13,0817 , and thoir staff averagod $1,738,848$ por month. In the prooeding yoar. statistion had been received from some 12,589 firms, with an average of 1,514,953 omployees. At the 1942 peak at Deo. 1, the number in reoorded omploy ment in the oight leading industrial groupe was 1,867,597, while the low figure was that of $1,651,757$, reported at the first of Larch. From the minimum to the maximum of mployment, there was an inorese of 21.4 points, or practioally 13 p.o.. in the index; in 1941, the gain from the low at jan. 1 to the high to Deo, 1 had mounted to 34.6 points, or almost 26 p. 0 . Based on the 1926 average a 100, the snual index of omployment in 1942 wa: 173.7 , or 14.1 p.o. higher than the 1941 average of 152.3 , and 57.2 p.o. higher than in 1939 , which for prootios purposec, may be regarded as the last year on a peacetime coonomy.

In addition, information wa furnished by finanoial institutione, for whioh the general reoord oomenoed in 1940 ; inoluding the data for suoh orgenisationa, the reporte tabulated monthly in 1942 agregated 166,071 , monthly verage of 13,839 ; their omployees averaged 1,802,320. The weokly payrolle of these persons seraged $\$ 51,634,695$, per oipita figure of \$28.65. In 1941, the reporting firmi in the aine lsading industrice manufaturing. logeing. mining, commuioations, transportation, oonstruotion ad mintonenoc ad corvioen, trade and finanoo, had nuborod. 13,440 , who so staffe had averaged 1,575,972.

## Explanation of the Mothod Used In Tabulating the Statistic of Payrolis

Industrial establiehmente mre asked to fumish data ehowing the aggregate earalage of tholr employees in the laet pay periode in the month, the employeen and their aarninge to be grouped acconding to the daretion of their pay pariode. The ume reported are inclusive of deductions for Hational Defonee Tax and Daenplogent Inent anco contribution. Cost-of-1iving allovances are also included.

The statements furnished show the amounts oarned in monthly, sem-monthly, fortighly and weoly per periods; occselonally data for otber perlode are given. Mary firme furnish information for difforent ontagorios of employoe who are paid st each of the intervale, while othere habitanily use only one or two per periof in their time-keoping organisations.

In the Bureau, the statintics of earninge roported for the varione periode excending a week are roduced to the proportions which vould bo earned in one veak, the nusorator of the fractions ordinarily used for this purpose boing ilx days, the standard voriding veek; the denoninatorn of the froctione are the nuber of dyr included in the different pay periods, oxivding oniy the gurdayn.

In the case of thone malariad moloyees whoe earnings are calculated on an annol or monthly bels, and are consequently not affected by the number of vorking daye in the pertod, fixed proportions are wed to reduce the carninge to a weokly baile, proportione wich are not varigi with the length of the calendar month.

The sues rosulting from these varloum calculations are then aggregated to odve the total anounte vhich vould be pald for services rendered in one weok by the persons on the purell: of the co-opereting establis shonte. Tho aployens roported are not in all cases nacessarily amployed for a period of eix days by one employer. As
 greater oxtent than in the former erreps, necesitated by the new quetionnalres, constitutes en lement of incomparability in the Fesent atatistic of employment, and those tabtiated prior to April, 1941.

[^0]The important inorease in the sumber at work in 1942 were aooompanied by relatively greater gaina in the weokly payrolle disburaed. These areraged $849,717,612$, reprosenting an earned inoome of $\$ 28.561$ /por wook for the typionl individual in rooorded employment in the ight loading industrios. The etatietios of payrolls are aveileble omly from Juno 1, 1941. On the average, thore wet an inorease of 10.7 p.o. in omployment and of 23.2 p.o. in the reportod peyrolle it the period juno 1-Doo. l, 1942, acompared with the semo period in 1941. Tho por oapita oekly average in the lat aovon monthe of 1942 was 11. 3 p.o. highor then in the period june 1-Deo. 1. 1941.

Geographioaliy, tho oxpansion in induatrial otivity in the year under roviow was widely dietributed. groept Prinoe gdward Ialand, all provinoe reported ooneiderable gaime, while omploymont in the oight loadigg oitios for whioh data are segregated generally inoreased in greater-then-average proportion. Industrially, tho adrance was, in goneral, oonfined to reletively amiler number of groupe than in reoontly-prooeding yoars. Bmployment in the menufacture of durable gooda rose by 32.6 p. O. in 1942 , Whereas that in the produotion of non-durable goode inoreased by only 14.1 p.o. Within the latter, the gain took plao to an important extent in ohomioal work and in plants turning out misoollaneou produots, largoly manufaturod for tho war. The relatively emali adrances whioh vore indioated in the othor milghtm manufaoturing industries in the jear under reriew as compared with 1941, took plaoe mainly in the esiler monthes as the year progresiod, ootivity in many inetanoes was at lewer level than in the latter months of 1941. This situation resulted In come inetanoer from ourtailment of omployment, and in othors, from inebility to inoreseo itaffa in eooordano with tho usual movements indioeted in reoent yeare. Employment in trade gonerally chowed ourtailment from 1941, the deolines doraloping se the year advanood. In transportation, oommunioations, oonstruotion and maintonanoe and cervioot, the volume of employment was groator in 1942 then in 1941 in the lant-named, the letost anual index wes the highest in the rooorde In conetruotion and oompunioations. the favourablo oompariaon goes bak to 1931, while reeorded onployzent in traneportation we more sotive than in any other year simoe 1829.

Iablo I on pege 2 ammarises the statistios of omploymont and payrolle in 1842, whil Tabl. II on page t prosonts oomperioon of tho employment data for 1941 and 1942, giving the ohenges in the numbor of roturne tabulatod, in the averagos of omployeen reported, and in the indexes.

The returac ourrontly tabulatod $2 /$ in 1942 , aggrogatod 156.972. E momthly average of 18, 0813 . Whioh exoeedod that in 1941 by 492, or 3.9 p.0. The mumber employed by the oo-operating eteblishmente roee by ore 223;700, or 14.8 p.c.. While the index geined by $14.1 \mathrm{p}, 0$. Of the last two oomparinong, that between the index mumber should be ued es guide to the ohenges in omployment. ince these indexes are adjusted for the inolusion of firms newly added to the miling list, at all for deolino in omployment resulting frem the olesigg of buinceses or bremohes.

In oonsidering the oomparisone in the induetrial part of table II. and these in Table it ithould again be noted that in nany oasea, edjustment 1/ Average of the ourrently-onloulated siveriges.
2/A oontimued growth is to be moted in the mumbor of ostablismmente inoluded in the Dominion Burean of statistios monthly ourvey of omployment. The gein 1e due (1) to the etablishment of newindustries and to other cooesilome to the miling ilst. (2) to inoresingly regular oo-operation from ouployara in coneral and ( 5 ) to the faot that a steadily inoreasing uumber of firme furnish etatistios in detail for loonlity and industry. The different branohes of buaines appear in the tabulation a soparate firmein the contror end in the industriol for whoh opparate roports arefurniahed. The "number of firme", at ueed here, might more prooisely be tormod $\quad$ the number of reptrte tebulated", but the former expresilon is in cooordanoe with the eage in other coriee and othor countrio..
3/8ec footmote on page 2 .

TABLE II - Average Number of Roporting Firme, and of thoir Employeos and the Average Indexes, for the Trolve Monthe, Jun. 1 - Deo. 1, 1942, together with the changes ahom in these figures as oamared with those for 1941.

oennot imodiatoly be mede for tho ohangot in the oomeoditios produood is individual stablishmente due to wartime demande on industry, although avoh hae boon don in this dirootion. Many manfaoturiag plante are not producizg perte and oommoditiot whioh are ontirely difforent from thoir penoetime linoan but it frequently heppens thet suoh ohenges sro not reported to tho Buroav. fhere aro also ohanges in the industrial distribution of workors as betweon the manfaoturing and the nom-manufaoturing olasses, for whoh adjustent likemise oannot iLimsdiately be made in these etatistios.

THE 1942 ANNOAL REVIEN OF BMPLOYMEXT.
The 1942 Annual has beon somowhat abbroviatod as oompared with forior ycars, 1 n ordor to oonsorve labour and supplies. part l deals minly with omployment, oontaining a falily dotalled roviow of the ituation in the farloue industrio and aroas, togethor with rolatod statistios of payrolls. In suooeoding pages aro notes briofly disoussing (1) the rooent movemente of enploy mont in tho veriou industribe and aross. (2) the sex distribution of the perione in rooordod mploymont at oot. 1,1942 . (3) the movemonte of tho ourtes of omployment and population and (4) the course of mploymont in the onited statoe and Canada.
part 2 of the Annual deals partioularly with the payroll data in their more general aspocte. There are also briof disoustions regarding (1) the changos in arorago earalage during tho poriod of the war, based upon available information in Canada, tho णaited Kingdom ad tho Onited 8 tates ( 2 ) the course of earaings and tha oost-of -11 ing in cenada during 1942, and (5) the ourrent statiotio of earings in oomparison vith the latest avilable data of the annus consus of Industry.

## TABLES.

Annul avorage indox numbore of omploymont for tho verlou aroas, the -1ght loading industrial oities and tho oight leading induetriee froz 1927 to 1942, together with monthly figures fino 1939, eppoer in Tablen l, 2 and at the ond of this report, whil zable 4 gives, for oonsiderable numer of industrios, monthly indox numbore for tho Domizion in tho lat two years. Shose indexe are osloulatod on the 1826 arerage se 100 。

In Tables $5-11$ appear tatiatio of amploymont and payrolla for the ©00nosio arese, the leading oitie: and industriens in these tablen, the indexan of employmont havo boon oozvertod from theis origiakl base, $1926 \pm 100$, to jume 1. 1941. Summary tables (notably Tablea I and II) appoar throughout the text. Numerous ohart are given throughout the dnaual, depioting the ourse of omploymont in various ares and industries.

1.     - EMPTOYNENT AND PAYROLLS BY IMDOSTRIES.
2. MANOFACTURING.

The effoot of modorn warfero, with its onphasia on oisntitio doetruotion through the producta of man's moohmioni ingenuity, 1a olesply soflooted in tho more rooont tatistio for the mafaotaring group, 4 , whelh omployment rose by $92.5 \mathrm{p}, 0$. from the outbroak of hostilitios to the and of 1842. This importent group of induetriod during the year ubder revigw provided work for almot 62 1a each 100 persone omployed by tho larger firmsi, a proportion oonsiderably exoeoding that of some 53 p.o. in pro-war yeara. In the uparge indioated sinoe wer was doclared, the seseonal pluotuctions Fhioh formerly oharaoterisod the general ituation in canade to minportant exceuta hare rirtually disappoerod, although thoy porsistin oertain industries 1/ The ourront survey are lisited in the min to ifris ofdicarily omploying 15 persons and over. In 1940 , they mployed more than 86 p.o. of the total number of workers in all manufaoturing etablishments roporting to the dmaual Consu: of Industry.

The curve is based upon the number of employees at work at the first day of the month as indicated by the firms reporting in comparison with the average employment they afforded during the calandar year 1926 as 100 . Curves are plotted for 1929, the year of maximum industrial activity; for 1933, when employment was at its minimum in the recard since 1920, and for the years since 1934
unusually dependent upon weather oonditione.
The trend of omployment in manufaoturing in 1942 wan oontinuounly favourable fron Feb. 1 to Deo. 1, inolutiv. Thí sorion of eloven uninterrupted gains oxtondod over the same monthe 1 in 1941 and 1940 p prior to the outbreak of war, the annual period of expanifion had invariably been shorter. Although the upward movement in the yoar under reviow was oqualin duration to that indionted in the two years immodiately prooeding, it was leas in extent than in either 1941 or 1840. The average index in 1942 , at 206.5 , wat 38 pointe, or 22.6 p.0.e higher than that of 168,4 in 1941, whon the inoronso over 1940 had amounted to 37 points, or 28.3 p.o. The adrances whioh have boon indionted maully during the war exoeed those in any earlior period.

Beginning with Fob, 1, owploymont in manfaoturing roaohod suooesoive new all-time highs. At the minimum t Jan. 1, the index was 31. 3 p.o. higher than at the same dato in 1941 , at the poak (at $D 00,1$ ), 1t was 17,7 p.e. Gbore the index at Doo. 1, 1941, when ootivity had also rosohed ite maximum for the yeer. The disparity in these percontages was of course due to the faot that the month-to-month ooeleration in the former year was more rapld than in 1942. Novertheloss, the growth in omployment from jane 1 to Doo. 1 in the gear under review, amounting to $18 \frac{1}{2} \mathrm{p} \cdot 0$. was considerably above-average, acoording to premar tandardes in the period from 1921 to 1939 , the rice from the beginnilec to the and of the year averaged appoximately 8.9 p.o.

During 1942, statistios were tabuleted from soze 7,278 mazufaoturers.
 the first of Docember. The 6,921 stablishments furnishing data sin 1941 had reoorded an average of 873,430 mployeen. The average working foree per establishment in the year under review rose from about 138 at Jaz. 1, to over 155 at De0. 1. Everaging 148 ; 1n 1941, the mean hed been under 126, amd in 1940, 102. The oo-operating employer reported the disbursement of weekly salaries and wagos averaging $\$ 31,435,351$ in 1942 ; thio would indioate that thoif anmual payroll approximatod $\$ 1,634,638,252$. In 1941, weokly arerage earinge wore avallable only from jume is in the period of observation in that year, the weekly average payroll wat $424,931,590$.

The oomparison of the avilable data for 1941 With those for the same monthe of 1942 howa an inorease of 33.7 p.o. in the avorege weekly payrolle of the oo-operating ostablishmente in the latter, whic the number in reoorded omploymont was greator by $19.3 \mathrm{p} \cdot \mathrm{o}$. Tho tatiotiog of payrolis in manufaturing are dealt with more fully, furthor on in this ootion, and in Part 2 of the Annul.

The industrial diatribution of the persors on the working forces in the year under refiew, as shown in Table II, oontinued to differ from the normal, With furthor expansion in the heavy industrios and in ohomiosisi/. ad a diminution in many linos producing oivilian oonsumera' goode. The groatot gaina in 1942 mero indioated in the iron and etoel groupl), (notably in chipbuilding, fireare and airoraft faotorios), and in the ohemoal and nomFerrous metal inaustries. Although only two majngroup: (riz., oleotrio light and power and rubber). showed general ourtailment at ompared with 1941, omployment in many of the industrial divisions listed in rablo il/ was at lowor level in the latter months of 1942 than in the same period of tho preooding yonre Tho doolines resulted from shortages of labour and in some onses, shortages of materisis. Among the olasses affected by this situation may be mentioned the food, fur, loather, lumber, pulp and papor and olay, glase and tono diviolons.

[^1]

In the durable goods group of industries, the expension in 1942 Wat partioularly outstanding, the naual index, at 239.1 , being 58.8 pointe, or 32.6 p.o., higher than in 1941, proviously the maximum 18 oompered with 1939 , the inorease amounted to $137.9 \mathrm{p} \cdot 0$. Tho growth in this oategory arises almost wholly from demends due to the war, With the virtual elimintion of the menufacture of oonsumer hosy good sortages of moterials and labour beoone progressively souto.

In the non-durable goode division, the advenoe in 1942 over 1941 meounted to 14. 1 p.0., bringing the latest index to 181.8. An important proportion of this gain took plaoe in the ohemioni industrios, where it largely coflooted wartime produotion. If the omployment ffordod by ohomioni plante be oliminated from the non-durable good group, the inoreese in the year under roview would be only 5.4 p.o. Were preoise informetion regarding the produots ourrently menufatured mreileblo in all cesos, it is posiblo thet the disperity indioatod in the peroentego gains in tho durable and non-durable divisions would be ven larger, ince many firms normally turaing out oonsumers goods have adepted their plante and equipment for the production of oommodities or parts required in the proeoution of the wars despite thoir intended use, theso in meny onees are olaseed in tho durable goods division. The deta on hend do not alway formit the immodiato ohange in olaseifiontion oallod for in many inetanoen, nor is it alvay possiblo for onployors to egrogate statistios of omploymeat tad payrolis for those ongeged on normal and on wertime produotion.

In eddition to the importent expanion in the oleases already montionod, there wer large gains during the year under reviow in factories turning out misoblisuoum manuraotured produots (suoh se soiontifio instruments, -to.). With smaller gaing in textiles, food, tobecoo and beverages. The labtaned division inoludes the anafaoture of alcohol for industrial purposes, es well as for beveragol.

The buoyant movomont in faotory omployment in 1942, gonerally oxtended to all perte of the ountry, ouols of the provinoes, and the ofght oitios for whioh dete ere segregated showing subetential improvement in menulaoturing a- oompared with 1941 and earlior yonrs.

The following tabl oonteins the annul indox numbors of omploymont in mafaaturing in the poriod ince 1228 , bated on the 1926 arerage at 100 -

| 3.4 | 1931........95. | 1935....... 87.1 | 1959.......112.5 |
| :---: | :---: | :---: | :---: |
| 1928.......110.1 | 1982........84.4 | 1936.......103.4 | 1940...... 131.3 |
| 1929.......117.1 | 1933........80.9 | 1937........114.4 | 1941...... 168.4 |
| 1980.......109.0 | 1934.......90.2 | 1938........111.0 | 1942......206.5 |

Payrolls. - Acoompanying the impressive inoreases in omployment genorally reoordodin manufacturing month by month during lese, wore relatively groeter gaing in the peyroll. From Jan. 1 to Doo. i, the indox of employment mounted by $18 \frac{1}{c}$ p.o. While that of payrolls rase by 39.7 p.o. In varying degreo, thee advanoen mre sesconal in cheraoters the more valid oomparison between Doo. 1. 1841, and Deo. 1, 1942, hows an inorose of 17.7 p.o. in omployment and of 29.7 p.o. in payrolls. The reasone given in the mozthly bulloting for the dieparity in the rates of increase in omploymont and payrolle may again be steted: ( (1) the growing oonoentration of workers in tho wore highly-peld hoajy induetrios, together whb important amount of overtiae work in those olaifes, and (z) the general pratioe of paying a boure to meet the rise in tho oost of
 allowemoe hes chown increases sino ite institution the up-grading of workers hat aloo oontributed to the greater expaneion is the roported payrolls, a fator of grewing importanoe whioh is tonding to countoraot the offeot of the lergerealo dilution of labour, coneequent upon the existing etriggenoy.

The oxtent to which the changing industrial diotribution of factory workere has contributed to the relstively larger growth in payrolis than in aplopment io ampheised by a comparison of the ligures for the durable and the non-durable goods group. Thes, the parroll index in the former at Doc. 1,1942 , was 42.4 p.c. higher than at Doc. 1,1941 , an conpared with the gein of 15 p.c. In the non-durable goode division; the index of amplogsent in the durable goods industries showed a rise of 29.7 p.c. in the twelve months, while that in the m-durable clasees incressed by only 6.5 p.c.

The veekly pavrolls distributed by the co-operating manufactures in 1943 averaged $\$ 31,435,351$ : the average wenkly earning of the trpical person in recordod mployment mae $\$ 29.18$. In the beven monthe of 1941 for which data are arallable, the avorage had been $\$ 26.60$. The index of ageregate payrolls rose by $60.1 \mathrm{p} . \mathrm{c}$. from June 1,1941 , when ouch otatiotice were instituted, to Dec. 1, 1942, in which period employment gained by 32 p.c. Dosplte the dilution of labour represented in the latter increase, the sarnings of the topical amployeo in manufacturing at $\$ 31.17$ at Dec. 1,1942 , were higher by 21.9 p.c. than at June $1,1941$. Thio gatn wae rathor greater than that reported in the oight industrial division as a whole.

The persons reported by manufacturing establiwhents constituted almoet 62 p.c. of the average number in recordod emplogment in the oight leading industrial groups during 1942. when thelr earninge made up over $63 \mathrm{p}, \mathrm{c}$. of the average weokly payrolle reported. Overtime mork no doubt contributed to a considerable extent to the moderate disparity in the proportione.

The growth in the reported salario and wages from the consencenent of the payrell record has varied considerably in the differont branches of manufacturing, not only becaute of variations in the rates of acceleration in omployment, but aloo as resuit of overtime, dilution of labour, upgrading and other factors. The gaine from june 1,1941 to Dec. 1, 1942, were part2cularly marked in chemical, tobacco, electrical apparatue, firearm, shipbuilding and land vahicle worke, and in those turning out other iron and steel producte, in all of wasch enploymant hat also materially increased. In most branches of manufacturing, the advance in parrolls from the beginning of the record to Decomber of the year under reviow, hae been rolatively much larger than that in employment; in the cases where the latter hae recently decinned, the anounts diebursed in ealaries and wages were, nevertheless, higher at the close of the year under reviev than at Jun 1. 1941.

As shom in Table 11, the highest per capita wookly earninge in 1942 were recorded in various branches of the iron and steel group, notably shipbuilding and sutomobilo plante, in ofl relinerfes, contral olectric stations, pulp and paper mills, electrical apparatue ad bevorage factories. In all of these contributing factors were a hich level of activity and the employment of large proportion of male workers. Among the industriea ehowng rolatively low weokly earnings were boots and shnes, textiles and tobacco, in all of which abstantial numbers of women are normally employed; as airesdy pointed out, the omployment of cansiderable stafio of iomale ordinarily bmplies a large proportion of the pounger workere, among whom rates of pay are usually lower than for those of greater experience.

The following paragraphe briefly reviow the 81 tuation in verlou branchat of manufacturing, after which is a short analysio of mploymant in the man mon-manufacturing clasee.

Animal Producta - Mdible. - There was a modorate gain in andmi food factorioe in 1942, when emplogment reached a new high levol. The mean index in this diviolon was 173.5. at compered with 172.0 in 1941. Most of the plight improvement in the yeas under reviev took place In meat-packing and dairving plants. The stafis of the 360 omployers furnimhing atatietice averaged 34,302 ; in the year before, the reported amployees averaged 33,925 , and the 11 rat. 346.

The reported weokly payrolis in 1942 svaraged $\$ 945,784$, whils the avorage per ouployeo was $\$ 27.57$ per week. In the perlod from June 1 to Doc. 1,1941 , the mean wes $\$ 25.18$. Messured from the former of thoee two dates, the index of employment, at Dec. 1,1942 , bad risen by 5.5 p.c.. as compared with the gain of 22.8 p.c. In tho index of payrolle.

Leather and Products. - In the first half of 1942, employment in lasther factorles was mors active than in 1941; in the econd ix monthe, the situation was reversed, but on the whole, amployment in 1942 wae brisker than in any oarlior yoar. The persons on the payrollo of the 350 co-operating ostablishments averaged 28,717 , an the index, 139.5 , as compared with 135.2 in 1941. Footwear factories affordod slighty more omployment, desplto a falling-off as the year
progressed. Tanneries and plants producing other leatier goods were also more active.
The co-operating establishments raported the disbursement of an average weekly payroll of $\$ 588,695$, an average of $\$ 20.50$ per employee. The average in the period of observation in 1941 had been $\$ 18.85$. Up to Dec. I. 1942 , the index of pavrolis had advarced by P1. 8 p.c. from June 2 , 1941, as compared if th the gain of 2.4 p.c. in the index of employment.

Lumber Products. - The Iumber industry genarally showed less fluctuation in 1942 than in 1941, when the index from the low point to the high rose by 42.6 points, as compared Wh an advance of 17.9 points during the year under review. From July 1 , the index each month was lower than at the came date in 1941, but averaged 216.4 in the twolve months, elightly higher than the mean of 212.1 in the preceding vear. The working forces of the 1,028 firms fumithing data varied from 57,491 persone at the beglaning of January, to 67.966 at Augunt 1 , averaging 62,495 in the twolve monthe, as compared with the 1941 mean of 60,238 amployod in 992 establishments. There was very littlo goreral change in rough and dressed lumber and furniture manufacturing in 1942, although activity in the latter part of the year was lover than in the same period of 1941. On the other hand, the production of alrcraft and parts, and of wooden vessels, provided work for a greater number of persons.

The payrolls reported by the co-operating lumber firms averaged $\$ 1,496,104$ in the year under reviow the per capita average was $\$ 23.94$. In the seven monthe of observation in 1941, the wakly average had beon $\$ 22.02$. When activity was at its 1942 peak at Aug. 1 , the 1ndex of employment wal 4.6 p.c. higher than at June 1,2941 , while the index of aggregate parrolls in the ame period had gained by $23 \frac{1}{2}$ p.c. At the ond of the year, the latter inder vas 18.4 p.c. bbove its level of Junc 1, 1941, although, largely as a result of seasonal influences, the indox of emplogment wal lowar by 6.9 p.c.

Plant Producta- Binle. - Factories turning out vegotable food generally afforded rather mors employment in 1942 than in any preceding yeari nevertheless, activity in many eatab11 shonts was reduced in the latter months ae compered with 1941 , mainiy due to difficulty in securing labour and supplies. The persomel of the 573 manufacturere making returns in the yoar under review averaged 48,409. In 1941, statistice ware recelved from 568 entablishmente, whose amployece averaged 46,545 ; based on the 1926 average as 100 , the mean index was then $146,2,28$ compared with 150.9 in 1942. The 1 uctuetions in omploywort vero on a decidediy maller scale in the jear under roview, when the index rase by 55.6 points, as compared with 69.8 point: in 1941.

The persone in recorded omployment in 1942 reoeived an average of $\$ 1,136,474$ in veokly malaries and wages. This represent od an averge pay envelope of $\$ 23.48$. In the period from June 1 to Doc. 1, 1941, the average wa. $\$ 21.81$. The index of parrolis at Dec. 1, 1942, was 25.9 p.c. higher thas at June 1, 1941, whon the payroll record commenced; in the same porlod, empoyent had risen by $131 \frac{1}{2}$ p.c.
gulp and Papar. - Desplte curtallment in the last quartar of the year under roviev, the polp and paper division reported a higher level of employient during 2942 , there being improvemont in the year as a whole in puip and papor milis, and in printing and publinhing end paper producte manufacturing. The amployee of the 723 omployors making raturn averaged 82,568 , and the index, 132.3 , as compared with the annual indox of 127.6 in the preceding vear, whon 719 plante had enployed 79,503 men and women. Of the 1942 aggregats, 37,358 mployees were ciassified in the manufactur of palp and paper, 15,107 in paper producte and 30,102 in printing and prablishing ostablishmonts.

The swe of $\$ 2,565,937$ was distributed, of the average, in weokly payrolls during the jear ender reviev by the co-operating 11 mas. This was an avorage of $\$ 31.08$ per omployee. In 1941. In the period from June 1 to Dec. 1 , the average had been $\$ 30.15$. The payroll index, at 1ts 1942 pouk at Sept. 1, was 11 p.c. higher than at the basic date (June 1, 2941), while in the same period the index of omploymen had Fiecn by 4.8 p.c.

Iubber Producti. - Imploymont in rubber manufacturiag was curteiled in 1942, follovins the outbreak of war in the Pacific. The annual index wal 128.8 , several points lower than that of 133.6 in 1941. The 58 mployors whose data were tabuleted had an avarago of 26,591 vortera, as comparod with 17,106 persons roported by 54 plants in 1941. From a maximum of 138.9 at Jan. 1. 1942. the index inclined. With only two interraption. to 125.9 at Oct. 2. S 11 ght

Lmprovemont was Indicated at the boginning of Movomber and December, but at the Intter, the index mas 12.3 p.c. lower than at Dec. 1, 1941.

An average of $\$ 457,440$ web paid in weokly salarice and wage by the firue reporting in the year under reviev. The typlcal employee in rocorded employment recolvod a weotly par onvolope of $\$ 27.57$ in 1942, as comparad with a par capita avoraco of $\$ 35.41$ in the poriod of observition in 1941. At Dec. 1, 1942, the 1adex of payrolls mas 14.9 p.0. figerer then whea tho statietice of carninge wors instituted at Jun 1, 1941, although in this comparisen there was a doclin of 3.6 p.c. in mployment.

Iextile Products. - the annun index numbor in textile was 166.6, an compared with 158.9 in 1941 ; these two are the bighent in the record. The mon and wom on the payrolis of the 1,35 7 co-operating establishment averaged 146,436. In the precediag yenr, the enplogees had sveraged 138,767 , and the roporting 11 rns, 1,281 . Dopite a high rato of labour turnover, there was comparatively littlo fluctuation in the aumber of workere indicated in the year maior roviev, the minimum and raximuw indexen having been 161.8 at Jan. 1 and 169.5 at May 1, whilo the Dec. 1 11gure was 166.1. On the whole, activity in cotton, woollen, ilk, hosiery and knittiug, garment and parnonal furnishings and other branche of thse group was grator than in preceding yeare; neverthelese, in several cases a falling-oif was ovidont in the lattor monthe of 1942, fesulting generally from incresing thortage of labour.

The comoperating textile manufacturere roported the dieburenont of an average wouldy payroll of $\$ 2,983,190$ during 1942 , when the per caplta average was $\$ 20.51$; that in the pertod of observeti on in 1941 had been $\$ 19.12$. Trom June 1,1941 . (whon the record of carninge wae cemmenced). to Docember 1, 1942, the parroll Index bad riwen by 21.3 p.c., all oompared with the increase of $4.2 \mathrm{p}, \mathrm{c}$. In that of mplogment.

Tobacco. - Thi trend of mployment in tobacco factorios continuod mpmard in the yene under roview, when the 46 onployere furniehing information had an average taif of 12,348 pernome. as compared with 10.407 in 1941; the mean index then wes $126.1,23.5$ point below the Latent annal average of 149.6. These two are the highest in the record.

The men and women in recorded employmat in 1942 wore paid a weekly avorage of $\$ 224,384$ In salaries and wage. The par capt ta average at Dec. 1,1942 , vas $\$ 20,00$ as coupared with $\$ 18.86$ at the same date in 1941. In compering these avarages with thooe thom in cortain othor industriee, it should bo noted that tobsoco factortes moloy an unumally large proportio on of femals workers. By the begianing of December, the 1ndex number of parrolls had risen by 88.2 p.e. from the basic date of June 1, 1941, whilo emploganont had, alvanced by 51.1 p.c. The gensu result from waconal causes as well as from other factore.

Beveraces. - Farther inportant increases ver nhown in the beverage industriee durlics the year under roviow, whon data from 150 establishmente indicated an averago worting force of 13,049 mon and woren; in 1941. the mployees had averegod 11,640, and the 1ndex, 210.9. Sne 1942 mean index, at 236.4 , constituted a now all-time high. The parrolle roported in 1948 averaged $\$ 411.475$ per weok, or $\$ 31.53$ per amployee, as compared with the avarage of \$29.57 In the latter part of 1941. Fron June 1.1941 , to Decomber 1, 2942, the roported payrolie bed edvarced by 31.6 p.c.. a proportion which greatly axcoeded the pain of $17,7 \mathrm{p}, \mathrm{c}$. in employment in the smo period.

Chemical and Allied Products. - Hariced oxpanelon was shom in the maneleoture of chemicals and allied products during 1942, when amploymont reached an unprecedentedy high level. The perions employed by the 386 comperating manufacturere averaged 87,685 , an conpared Wth 46,609 in 35 ? atablishoont in 1941. Activity incroasod with littlo intorruption from the outbreak of war unt11 the and of 1942. The mafority of the portonnol of chempal plants in the year under reviow wal ongaged on war production. The roported alarles and wegen everagud $\$ 2,496,663$ in 1942; thin ropresented an avorage vookly'par envolope of $\$ 2 \beta_{0} 47$ par caplayse. In the poriod for which statistic are avellable in 1941, the avarage was \$26.95. From Jum 1 of that year to Dec. 1,1942 , the roported parrolle rose by 152.2 pocos whit the numbr of omployee advanced by 113.8 p.c.

Clay, Glass and Stone Products. - The manufacture of clay, glan and etope prodects afforded ore enploymont in 1942 than in any curlier year of the record. The man isder was 132.1, ae compared with 126.4 in 1941, while tho stafle of the 223 factorles farminhlug data

Chart 5

## Emplorment in leading industries

avaraged $14,907,4.5$ p.c. higher than in the preceding year. In pite of this higher avarage, activity in the last fow month of 1942 was at a lower lovel than in the same period of 1941.

An averago weokly parroll of \$408, 885 was distributed by the co-operating estahlishmento during the year undor reviow, whon the per caplta avorage was $\$ 2 \% .43$, as compared with $\$ 25.01$ in the period of observation in 1941. The index of payrolls at the beginning of December wa 25 p.c. higher thas when the record comnenced at June $I_{1} 1941$, the accompanying increase in employment was 1.7 p.c.

Hectric Ilet and Powor. - The 102 co-operating contral eloctric statione had an average of 18,349 enployeen, an compared with 18,720 in 1941. It is probabls that the decline we due to the completion of certain construction work, in some case included in the operation of the stations. The lateet annul index, at 144.1 , was ilghtiy lows than that of 147.1 in the preceding year, but wal othervile the highost in the record.

The weolay averege payroll of $\$ 630,612$ indicated in 1942 represented an average of \$34.37 per woricerf the per capita figure in the period of observation in 1941 was \$32.06.

Iectrical Apgaratun. - This group of industries afforded a much greater volime of employment thas in any other year, largoly as a rebult of wartime demands for its producte. Data wert received from 151 11rme, whose taffe aroraged 36,379 ; the annual index wae 254.5. In 2941, the roporting ontablishments averaged 139 , and thatr omployees, 30,287 , while the mean Index was 212.6.

The persons in recorded employwent in the year under roviow recelved a weekly average 01 \$1,114, 453; the per caplta average wa $\$ 30.59$, being considerably higher than that of $\$ 28.14$ reperted in the period of obeervetion in 1941. Whoro pavrolle have risen by 59.8 p.c. from the conencement of the record at June 1,1941 , to Doc. 1,1942 , the number of employees hae gained by 37.2 p.e.

Iron and Etent. - Bince Jan 1,1940 , caployment in iron and tewl has ohown aniaterrapted expanilon, wich by 1943 rosulted ic the trobling of the staffe by the roporting plantsi those areraged 1,167, with an avorage vorkirg force of 388,596 . In $1941,1,046$ entablishangts had indicated 270,715 employees, on the arerage. The latest annual index, at 286,2 , vas higher by 18.3 p.0. than in 194. During 1942 , the index sdranced from 243.4 at Jom. 1 , to 330.0 at the boginitg of December. This gain of $36.1 \mathrm{p}, \mathrm{c}$. Within the yoar vas mothor maller than that of 50.1 p.c. in the preceding twolve monthe, but was, novertheless, considerably greator-thannormal. The coneonal influances, which in pro-war deys usually caued marked fluctration in the iron and steel indutition in difforent parts of the year, have largely disappeared uader the proeevre of war production; in genoral, the only curtailmant in eaploysient recentiy recorded has been connected with shortages of matorial, changes in inodels, or in kind of production, or iaberr disputes.

The creatoet increace in emploment in 2942 took place in ohipyarde, arcraft and ilreas plante. althouch vory general advances vore indicated. The growing inortage of malo
 Wher the inventigation of the cex distribution of thote employed by the co-operating companion vas ande at Ost. 1,1942, it ras found that womon workere then constituted 140 in each 1,000 pertom on the thafis of the reperting $1 r 0 \pi$ and uteol plarti, sproportion conldorably oxcoeding that of 6.1 p .0 . indicated in the returne made to the anmul Conete of Inductry for 1940.

Acoonpaning the notable gains in employont during 1948 vere proportionately larger advace in peyrolis; thene avoraged $\$ 13,274,991$ per wook giving the trpical individual in racorted employiont an average mokly wage of \$34.16. This we coneiderably higher then the avarage of \$31. 10 reperted in the period of observation 12 1941. The ivdex of payrolla at Dec. 1, 1942, was 99.8 p.c. Ebote the Juns 1, 1941, 11gure; in the mame poriod, the indox of emplegnent had rien by 65.2 p.c. The 1 ron and itenl croup reported 22.3 p.c. of the total Encor apiogad by the co-operating anploger in the oight leading inductrion during 1943, villo their calarios and maco conotituted $26.7 \mathrm{p} . \mathrm{c}$. of the weoklj ararage indicated last jear. popite the ifportant dilution of labour concegunt upon growing shorteges of traind vorkers, the per capita averge earning of the hypical individual anployed in the iron and steol group

## EMPLOYMENT AS REPORTED BY EMPLOYERS IN MINING ESTABLISHMENTS

1925-1942

Yog-forroun Motel Product, - The offoct of the war apon non-forroum matel plante vas also vary great, as was shown in a rise of almont $25 \mathrm{p}, \mathrm{c}$. In the index of cmploymet from dan. 1 to Doc. 1. The annusl average wa. $349.4,28$ p.c. h1 ghor than 10 1941, proviously the maximum. Informetion wa furnished by 227 factorion whoee staffe averagod 52,753 , as compared with a mean of 40,721 mployear in 209 plant in 1941. Greatiy aocelornted activity vae indloated in the yoar under review in aluminum, nickel and other base metal plente.

Ths weekly ealarios and wagen dindursed by the reporting caployer sveraged $\$ 1,688,114$ In 1942, per capita everage of $\$ 32.00$. In 1941, the typioni individual in recorded eaplogmont recalved ar average pay envelop of $\$ 29,52$. The index of payrolle et De0. 2.1943 , had rieen te 170.9 since June 1, 1941; this accompanied an increase of 41.9 p.c. in the mene period in the amployment afforded by the co-operating establl sheonte.

Non-metallic Mineral Producte. - Conelderable numbere of pereoni were edded to the roported taffe in thene ind ustrion in 1942; the working forcet everaged 14, 912 in 102 plants, as compared wih 13.915 in the preceding year. The lateat index, at 195.6 , wes higher by 8.4 p.c. than in 1941. Oil refineries were active and igprovement was eleo show in other brachec of the non-metalic mineral eivision.

The payrolls distributed among the men and womn in reported mployment in 1942 arorn aged $\$ 532,412$, a per capita figure of $\$ 35,70$; the average in the period of obsarvition in 1941 wes \$34.19. The index of parrolls at the ond of the raar wae blgher by 21.9 p.0. than at Juae I. 1941. Betweon that date and Dec. 2, 1942, there way an increace of 9.7 p.c. In the index of amployent.

Other Manifacturing Industrien. - Largoly as a rasult of vartime demande for various important commodities of mixed origin, employment in the miscellasous group of inductries reachad a now all-time high in 1942, wor the index averaged 331.2, se compared 1 th 211.0 in the proceding year. The co-oporating establishents ambered 157 , and the emplojeec, 14, 079; in int, an average of 127 reports had beon tabulated, and the staffe averaged 8,193 . The calarioe and rages disbured in 1942 amounted to a weoky averago of $\$ 379,336, \$ 26,94$ per eaplojee.

To general change was homn in fur mamfecturing ac compared with 1941, although emplogment in the latter monthe of the gear under replew was at a lower level than in the lest quarter of 1941. The reported emplojeen averaged 2,926 , and the index, 121.2 ; those ficruree were the wase in 1941. The esraings of those on the payrolio in 1942 averaged 177.132 , a per capita averege of $\$ 26.37$. In the period from Jun 1 to Dec. 1,1941 , the average per emplogee was \$24.79.

## 2. Iocarwa.

Deapite curtailment in the last quarter of the ysar, amploywent in logsing, on the avsrage, was in greater volume in 1942 than in 1941, or any other year for wich statistice are availablo. The lackening in the later month was due to the preveiling chortage of labone. On the whole, mployment in 1943 showed rather less fluctuetion then is customary; from ite low to ite high position, the index varied by 125 points, as compared with a variation of l68 pointe in 1941, and 213 point: in 1939. The 1942 indexes avoragod 196. 5 , rather higher than the mans of 187.8 in the year preceding. The number of omployees reportod by the 455 comoperating estab11 shment areragod 58,296 , ranging from 42,165 st dug. Io to 79,272 at Tob. I. In 194, 445 omployers hadindicated an average working force of 55,696 porsone.

The roporting omployer dieburned an average wotkly parroll of $\$ 1,185,981$; this roprosonted per caplta average of $\$ 20.70$. For varlous reacone, the average in the locging group in lower than in many othar industries; among these roanons may be mentioned the Ract that the figures reported do not include the valuo of board and lodeing which is uemily a part of the ramoration of thome engaged in buin work. Arother important factor is the high labour turaoter in logeing.

The difficulty of collecting statietice of employment for the logelng indestey, pointed out in previous Anaual goviews, must again be stresed. Nhis rosult pertly from the faot that pany of the larger operatore let thelr wood contracts to mull contractore and to cettlere on the northern frontier of ettlement. from whom in many casee it is impoesiblo to obtein cath, at any rate in time for inciusion in the monthiy gurveys of enploymant and parolis. The

EMPLOYMINT AS REPORIED BY EMPLOYERSIN TRANSPORTATION ESTABLISHMENTS
(100
dificulties in this rospect have boon incronsed sinc the institution of the pasroll etatisticu, for the reason that several of the larger companies which formerly reported the number of their contractors amployees, are unable to state the wages pald to such workers. It is frequontly impoesibl. to obtain the statistic from the contractors; to some oxtent, this is due to the inaccesibility of the cump, but there are also other factors ontering into the situation.

## 3. MINING.

Ming operation were adversely affected by labour shortages in 1942, in of ght monthe of mhich employment was in saller volum than in the same period of 1941. With only one exception, the trond in the group as a whole was unfavourable in each month of the year undor reviow. Tho indor declined from 177.8 at jan. 1 , to 162.7 at the boginning of Decomber, averaging 171.3 in the twolve monthe; the 1941 mean had been 176.6.

The 80,056 employees reported, on the average, by the 428 co-operating mining operator: vore whwn to have carned a voekly averago of $\$ 2,785,432$ in 1942 . This wae a per caplta average 01 \$3.81, which was highor than in any other of tho main induetrial groupl incirded in the monthy urvers, although it was exceeded by the average in a fov manufacturing industrien. The 1ndex of payrolis roe from 100 at Jwe 1,1941 , to a peak of 112.0 at Mar. 1. 1942, thence decilning to 103.8 at Mov. 1. This falling off we accompanied by a loss of aight p.c in employnant in tho period from June 1, 1941, to Nov. 1, 1942.
 94.7 In 1942, as compared with 94.9 in the proceding year. A working force of 26,020 persons was employed, on the arorage, by the 105 co-operating ilrme, who hed bad 26,056 omployee in 1941. The roported parrolle in the year under review anounted to $\$ 808,893$ per week, a per capita aver aco of \$31.09. At the ond of 1943, parrolls in the coal-mining division had risen by $37.6 \mathrm{p}, \mathrm{c}$. frow Junc 1. 1941, whil amployment in the mame period had adranced by only 1.1 p.c.

The labour stringency affected particularly metallic ore mining, notably of gold. From the firnt quarter of the Fear, omployment was quieter than in the same period of 1941, and as the year progreseed, the comparison with arlier years olnce 1937 al so became unfavorable. The indox averaged 346.1, as compared with 366.2 in 1941 and 350.9 in 1940; theee three are the hichet in the record. Data were tabulated from 207 employers whose vorkiug forcos aggregated 43,215, varying from 44,614 at Mar. I, to 39,963 at the begiming of December. The reported voekly parrolls of persone amployed by the comoperating metallic ore mines averaged $\$ 1,668,080$, a per caplte avarage of $\$ 36.60$. This was exceodod only by the averago in certain iron and - ceel croupe.

Iop-ratalilc afnerale other than cond. - This induetry provided more amplognent than 1a 1841 or onrlier yeare. The reported mployees averaged 10,821 , earning a weekly payroll of \$308.459. The per caplta average was $\$ 28.51$. In 1941 , the persons on the staffe of the cooperating firme numered 10,129 . The 1942 mear index of employment was 159.4. compered with 150.5 in 1941. Considerable activty was indicated in asbestoe mining, quarrying and other divielons of the group.

## 4. TBAMB PORTASIOR.

Jiplogment in tranoportation wae in greater volvin in 1942 than in any earlier year vinoe 1929. The 560 tran portation and torage companies whose returne were received amployed an average of 132,994 men and vonen; in 1941, the roported persomnel averaged $123,195$. The rumber of fism furniching data was 545. The parrolls diebureed to those in recorded enplogment is the year under reviev, areraged $\$ 4,614,106$. The par capita evirage wal $\$ 34,70$, a ligure which wae conelderably highor than the all-industries average of $\$ 28,56$, and was only oxeooded by the sterege in ininis and a fow other industrios, malny in manufacturing.

The acrual isdax number of amployment in tranaportation was 105.5 , as compared with 90.9 in 1941. In the period from Jun 1 of that year to Doc. 1, 1942, the index had riesi by 10.3 p.c., while the parrolls hed increased by 23.3 p.c.

The operetion copertmente of the afean sillway afforded omployment to an average of 75,290 persoms, te compared with 69,016 in 1941 . The index rose 1 rom 86.6 in that rear, to 94.4 in 1848, whon it was higher than in ony carlier year fince 1930. The carning in this

Chort 8
EMPLOYMENT AS REPORTED BY EMPIOYERS IN CONSIRUCTION ESTABLISHMENTS
1925-1942

division rese particularly high, the vookly everege betw \$37.99.
In the etreet ralivare and cartax and oforme sroup, cotivity reaphed ane all-time maxtrum, the reported staffic avoragod 36,846 , and the 1ndex, 263.3 . In 2911, the Ifgurve hed besn 34,762 employens, and an annumi index of 145.3 . The par capita averuge carnfnge in the local trantportation divielion ware $\$ 31,02$ per voak in 1942.

Firme in the shippins and stovedorine indumery recorded a porsonasi of 20,850 persens during 1942, at corpared with 19,418 in the proceding jear. The tariation wat from 15,685 at
 14 1941. These two wert. ibe hifhent eince 1930. The per capd the average earninge in thie division in 1942 were $\$ 29.29$, 11 gure whiob undoubtediv included parent for coneldoreble overt1me work.

## B. COMRMTCAPIOMS.

Moploynens in commulcatione was in grater rolue than in any other vear since 2u31, the working forcse of the co-operating enployers avoraging 27,705, of whom 7,058 vern reportut? by telegraph companies and 20,649 were ongased in the telephone divicion 'The cenoral increane over 1941 wat sovea p.c. The indicated weokly parrolie in 1942 areraged $\$ 779,431$, a per capita 14gure of \$28.13. Throughout the poriod of observation, (1.e. from Juse I, 1941, to Deo. 1,1943), the payrelle have risen by 16 poc., and enployment has gained by covan p.c.

Activity in the commulcation division wan unumaly great in 1942, when the index was et its highout level ince 1931. It vas, however, conviderabiy lover than in 1928-30, employment in the group as a vhole, in the intervening pears, having been adverself affectod by the widespread ubstitution of mechanical for manual muspaent in the tolophons division.

## 6. CORSTRUCTIOR AND MANMENAMCS.

The co-operating conatruction I1mai alforded more ploynont in 1942 than in any othor year slace 1931. Hont of the work roulted from wartime requiremente. Improvement was born in building, and by the coastruction and maintamance dopartments of the rallmays, while hisfay work, in general, was quister. The index of amploymant in construction as a mole averared 130.3 In 1942 , compared with 126.6 in the precediag Jesr. An average taif of 164,189 parsome vain reported by the 1,482 contrnctors furnishing data, whose veekly peyrolls avoreged \$4,367,699. The per caples average was $\$ 26.45$. The index of payrolls roes by 34.6 p.c. in the parlod from June 1. 1941, to Dec. 1. 1942, while that of employment advanced by 8.5 P.c.

In comection with the date for building construction, It mat be pointed ouq that beceuse tho monthly survoys are limited, in the main, to establishmente ordsnarily caployins 15 permons and over, thay do not cover a conslderablo proportion of the wort normally carriod on by small contractors, ouch as houso-buliding. ropalrs, siterations, efc. Suoh wort has beon serlously affected by warilme shortagon of labour and materiale, priorities in theae reapoots favouring the ilrme ongaged on defonce contracts, who are largely represented in the monthiy statistice.

The trend is builiding was favourable frow Agr. 1 to the beginaing of December, wben the Index reached new maximum of 205,6 . The employgse roported averaged 68,675 , whose weekly payrolle In 1942 averaged $\$ 2,142,487$. The oer capita averago was $\$ 31.20$. In 1941, the personnel of the co-operating contractore bad avereged 60,531.

Rond conctruction was quiotor, on the whole, than in 1941, when the reportod etaife had averaged 61,954 , as compared $w 1$ th 57,280 in the yoas under review. The mean indox res 145.0, whowine a decilme of 8.3 p.c. 180 m the 1941 average of 153.2 . To an important axtort. the work is the year under rofiow wat conneoted whth the devalopment of afr ports. The veekiy par capltiluterage earninge in 1942 woro givon an $\$ 22.92$, the everage meckly payroli diaburted hy the co-operatims amployer amounting to $\$ 1,312,534$.

Activ1iy in reilmar construction and maintenance wa genorally briekme in 1948 whem the indlcated working forces avereged 38,234 , and the 1 ndex, 89.0 . In 1941, the avexages were 35,796 , and 84.3 , reppectively. The persons in recorded moploymont in the gear under reviev vare pald an avnrage of $\$ 912,67 B$ per vole. The contantr of tho typleal mackiy pey envelope were stated as \$23.87.

Chort 9
EMPLOYMENT IS REPORTED BY TRADING ESTABLISHMENTS
 employment they afforded in the calendar year 1926 as 100 . The broken curve shows this crude curve corrected for seasonal variation as determined by the experience of the last nine years.

## 7. SARVICES.

The co-operatias lotal and restaurante and laundrios and dry-cleaning ostablishonts afforded phoyment in 1942 to an average of 39,841 men and vonen, of whom feanle vorkere conitituted a majority. The veokiy payrolle anounted to $\$ 692,525$. In 1941, the employees had aroraged 37,279. The latest annul index, at 178.8 wat 6.7 p.c. highor than the previous mardmon of 167.6 in 1941 . Thie advence, though conniderablo, was decidediy omallor than that which had been noted in the preceding year over 1940. It is also noteworthy that employment in 1942 shoved mallar llucturtion than in 2941, when the index adranced by 35 pointe from ite low to Its high position, all compared with the variation of 22 points in the year under reviev. This ittuation largely reeulted from the oxinting labour stringency. while the curtallment of the touriet businese also reacted unfavourably upon mployment in holidny resorte.

The per cepita weakly average earninge in 1942, based on the data given above, vere \$17.37. This relatively low avorage reflects the conciderable proportion of inmale labour to whoh reforence he already beon made; other factor: wore part-time oployment, and the fact thet persone ongeged in hotel and restaurants irequently recolve part of their remunoration in the form of boned and lodging, for which no allowance is made in these statistics of payrolls.

## 8. TRND

In the f1rit fow monthe of 1942, mployment in trading astablishments was in greater volume in moet parte of thm Dominion than in the ena pariod of 1941 . From May 1, hoverer, difficulty in cecurfs belp and other factore greatiy affectod the situation and the indexes In the laet ceven monthe were lover than in the cane perlod of the year hefore. The average worting fores of the 2,200 raporting atablishente was 160,296 ; in $1941,2,177$ smployors had reported a parsonmel of 158,266 . Men adifuetmont is made for the iacrease in the comoperating 11ris, the 1942 index, at 156.1 . was fractionaily lower than that of 156.5 in the proceding remr. Thase two ilfuren are the highest in the record.

As mentloned in provious annval reviow of mploynent, there hat in recont yeare been a frowlas tendenoy for the larger etores and chaln organiestions to absorb the small businessen whioh would otherwise not be represeated in these otatistici, a change in organisation wich has no doubt baen a factor in raising the inder of employnent in trade to its proeent hich lovel.

The roportod parroll averuged $\$ 3,857,108$ in 1942 ; the per capita average was $\$ 24.07$. The inder of payrolle betroen Jun 1, 1941, and Dec. 1,1942 , rose by $12 \mathrm{p}, \mathrm{c}$. . accompanied by a cain of 4.9 p.c. in the number of amployees; in this comparison, it should be noted that ceasonel activity normaliy is conciderably greater at the lattor date than in the aarly apring. The parelle reported in wholesale trade are relatively mach greater than tho in the rotall division, where harce proportion of the workere are women, and the quettion of part-ife elso onter into the oituation to a conidarable oxtent. The por capita avorage in retall establiohmante in 1942 mas $\$ 22.08$, and in wholesal houser. $\$ 30.53$.

It $w 11$ bs noted that the gain in the index of payrolle in trade throughout the pariod of obearvation hae been rolatively ilght; the explanation is that in the monthe since Juno 1 ,
 of enlognent for alosmon of mah comodition, whote earninge ordinarily are above the genoral everage for tiading oitabliehmente. The Dee. 1,192, index of peyrolis in trade wee 112, at congered with thet of 104.9 in employnent.

## 9. HIMAMCI.

The record for the itnance froup wae comonced only dueing 1939, for which the tatist10 ase incomplete. Informion wair recolved from $7 B 8$ entablishmonti in 1942, whose employees averaged 65,473, se compred with 60,672 in 1941. The increate in ateribed largely to the
 armed forces or othmise changed thair poritioni, and also to cope $M$ th the increased volum of werk remulting from tho mer. The index of maploymont in financinl institutions averagod 122.9. In the rear moner reviov, as compared with 117.2 in 1941.

Chot 15

## EMPLOYMENT BY ECONOMIC AREAS

The um of $\$ 1,916,983$ was reported as having been disbursed, on the averuge, in weokly salarien and wages in 1942. The voekly per capita average was $\$ 30.20$. This was higher than the general everage of $\$ 28.56$ in the eight lading induetries. The inclueion of statistice for the finance group in the total for the latter ralsed the numer of reports tabulated during 1942 to a monthl average of 13,800 , the number of employees included in the current surveys to $1,802,320$, and the aggregate veokly parroll to $\$ 51,634,595$. The per capita average in the nine industrial divisions was $\$ 28.61$.

Although employment and payrnlls in financial institutions showed Eignificant gains during 1942, the increase generally vere on a maller scale than those in several other indus-t-les; accordingly, the addition of the figures for this group to those for the eight leading industries lowers the 1942 average index of employnent from 173.7 to 171.2 . In 1941, the mean, Ithout f1nance, had heen 152.3, as compared with 150.6 when the mployees of financial houees wore included. The index of payrolls for the ight industries rose from 100 at June 1,1941, to 144.3 at Dec. 1 , 1942, whis for the nine main industries, the gain was from 100 at the former to 143.0 at the latter date.

## FNELES SHOWIMG RPLONGEY BY IMDUSTRIES.

Table 3 gives index mumbrs of employment by main industrial divisions in the last three yoar together with annual averages since 1926, whilo the trende of omployment in soree 60 induptries, sonthly during the years, 1941-1942, are shown in Table 4. 1 . The columa hoaded "relative weight" chove the proportion that the number of employees in the ryocifled induatry is of the total aumber of omployee reported in Canada by the firm making returne at June 1 of the indicated yeare; the numbere amployed, on the avarage, in 1942 are shown in Fable II.

## 2. EPLONLENT AND PATROLLS BY BCONOMIC ARTMAS.

Enployment in all provincee excopt Prince Fdward Inland was in greatinr volume in 1942 than in 1941 or ayy earlier year. The growth was generally lose pronounced than in 1941 or 1940 , but vat nevertholess considerable in most provinces. The incresses ranged from that of $2.4 \mathrm{p}, \mathrm{c}$. in Eackatchovan and 8.2 p.c. in Manitoba, to 18 g.c. in Quebec and 21.5 p.c. in Mritiah Columbia. The magntude of the geins was, of course, malniy dependent upon the indurtrial distribution Whin the area. In all provinces, the increases in the pesrolis disbursed by the co-operating firm wor relatively greater than those in the number of omploye9s, so that, despite considerable dilution of labour, the gemeral per capite wookly averago earninge in all provinces vere cubstantially higher in 1942 than in the poriod for which inforpation was arailable in 1941.

Manufacturing on the whol in oach of the provinces reached new peaks of activity in the gear under roviow. Th gaine in $150 n$ and teel and other heavy induetries wern very widely distributed, while the light manufacturigg groups in some area. showed crreallment towards the latter part of the year. largely as a rasult of shortages of lahour, and in some casas, of materials. Aong the non-manufacturing indubtrine, omployment in mining was generally in mallor volve in 1942 than in the vear bofore. Transportation and comenications were active. Trade and eervices provided vork for considerably more persons in the earlier part of the year, hut In the latter monthe, the growng shortage of labour made increaningly difficult the paintenance of itaffs at full etrongth, and there was consequently a diminution in the voluma of emplogment affordsd in cortain casen, whil. In others, seasonal expansion was below-normal in extent.

## 1. Maritime Provinces.

Daring the f1ret fow monthe of 1942, omployment in the Maritime Prorinces showed cur telleent. Beginning With Mar 1, however, the general trend, with only one exception, was farour ab10. In 1941, improvement had been indicated on nine occasions, as compared with seven in the

[^2]year under review, when the gaine were on a galler ncalc. Hoverchelosa, employment in each month of 1942 was in ereater volume than at the wan date in the yoar bafore.

Statistics were received from 938 employers, whose working forces averaged $130,386$. In 1941, the number of co-opersting evtablishment had averaged 896, and their eaployees, 115,948. Of the number in recorded employment in the year under reviev, Frinoe Fdmand Isiand reported an average of 2,111 , Nova $5 \cot 1$ a 79,179 , and Now Bruanick 49,096 . Largely as a rovult of the concentration of heasy industries in Fove Scotia, activity in that province reachod a higher level than in elther of the other two.

Toplognent in mamifacturing gonerally in the Maritime Provnces was brisker in each month of 1942 than in any earlier year; the index number averaged 278.0 in the twolve monthe, as compered with the provioue maximue of 149.6 in 1941. Among the non-manufacturing industries, logging, communications, transportation, construction, eorvices and trade efforded greafor employment. On the other hand, the number of persons employed in mining vas rather lese than in other yeare elnce 1936.

The weekly payrolls distributed by the co-operating firas averaged $\$ 3,299,393$, a per capita of $\$ 25.34$. In the pariod from June 1,1941 , to the ond of 1942, the index of parrolls TOR 54.9 p.c., as compared with the gain of $28.2 \mathrm{p} . \mathrm{C}$. in the index of omployment.

The higheot average earninge in the Maritime Provinces vers roported in tranoportation, with the ircn and ateel industry, pulp and papar and mining coming noxt in ordor. Thin omer was not dissimilar from that prevaling in other parts of the country. Among the factorn tonding to produce in this area an all-industrie per capita average that is rather lower than the Dominion mverage, may be mentioned losee in working time as a rearlt of industrial disputes, while the fact that in many cases the reporting induetrios are situated in relatively amall centree probably aleo contributes to the lower-than-arerege maan.

## 2. Gueboc.

There were ton moathly increases in exployment in Quebec durius 1942. Whan the index number of employment averaged 186.2, ae couparel With $15 \% .8$ in 1941, proviously the maxisum in the record of twenty-two vears. The number of employens reported averaged 543,982 , rising fiom 510.415 at the opening of the year, to 591,454 st the beginaing of December. The number of csoperating firms averaged 3,305 in 1942, whl 10 in the year bofore, an aversgo of 3,147 establishmente had employed an average of $45 \%, 780$ parione. The average veokly payroll reported during 1942 we $\$ 24,551,017$, which representsd $\$ 28.70$ per omployee. Druping the period in wich etetistic of peyrolis are available. (that 19, from Juno 1,1941 ), the increase in the veokly disbursements wan 54.4 p.c. The accompanying gain in employment wae $28 \frac{1}{2}$ p.c. On the whole, the proportion of enployess in Quebec to the Dominion total for the co-oporating establiahmente rather exceeced the proportion of payrollo. Thue, in $1942,31.3$ g.c. of the persone in the ight leading industriez in the Dominion were domiciled in Qughec, but their earninge conetituted 29.3 p.c. of the Dominion total for the same industries. To some extont this disyerity results fron the fact that emplognent in the province increased in 1942 with more-than-average rapidity, ontailing considerable dilution of labour. The industrial distribution within the province slso contributed to this result, there belng abnormally large proportions of workere in textile. leather and lumber mille, logging and in certain other diviaions, in which earninge are frequently below-average.

Implopment in manufacturing in relation to the 2926 level, wbe higher in Quebec than in the Dominion as a whole; the former index averaged 217.7 in $1942,24.7 \mathrm{p}, \mathrm{c}$. above that in 1941, whle the Canada mean of 206.5 was 22.6 p.c. higher than in the fear before. Practically all classe of manufacturfing, on the whole, afforded moro omploynent in 1942, desplte pone alackening in certain divisions as the year progreosed, notably in toxtilee. The various groups of non-mannfacturing induetrion aleo ohowed a generally high level of activity.

## 3. Ontaria.

A. in 1941, the movement of employment in Ontario was favourable during oleven monthe of 1942, there being in each rear a decline at Jan. 1 , which resulted from curtallment orer the hcilday and other seasonal factors. On the whole, however, the expaneion in 1942 wae not so extensive as in the preceding year. The general index araraged 179.4 , ae compared with 160.0 in 1941 and 129.2 in 1940; these threo aro the higheat in the record. The co-operating firme
nubbered 5,643, with an arerage working force of 728,479 persons, whose weekly earninge in the jear under reviow avoraged $\$ 21,786,521$. The per caplta ifgure wa. $\$ 29.88$, which wae higher than in agy other province except Britioh Columbia, also exceeding the Dominion average of \$28.56. Unumaliy large proportions of workers in iron and steel and othar heavy manufacturing industries, in non-metallic mineral mining and in other ciasses where earnings are relatively high, are mainly responsible for this result, which aiso reflecte considerable overtime work. The firme reporting in Ontario disbursed $43.8 \mathrm{p} . \mathrm{c}$. of the total payrolls indicated in the oight leading industries, wile their proportion of employens was $41.9 \mathrm{p}, \mathrm{c}$. of the total in 1942.

The index number of mployment in manufactiuing in Ontario avoraged 204.3 in 1942, as compared with 170.9 in 1911. The 1942 figure in Ontario was silghtly lover than the Dominion. total of 206.5 ; the increase from 1941 was also below the general gain. Nevertheless, employment in manufacturing was sutained at an extrenely high level, the index, with only one exeoption, rising uninterruptedly from the opening of the vear. Practically all branches recorded greater activity in 1942, despite ome curtailment in a number of industries as the year advanced. Among the non-manufacturing groups, mining, construction and maintanance and trade were quioter than in 1941. Frployment in mining was also slacker, on the whole, than in 1940. In logging, comunications, transportation and services, employment in Ontario reached now all-time high lovels.

From June 1, 1941, when the record of payrolls was commenced, to Dec. 1, 1942, the index nuber of employment rose by 16.2 p.c., while that of payrolis mounted by $35.7 \mathrm{p} . \mathrm{c}$. In the semo period.

## 3. Prairi. Provinces.

Data weire raceived from 1,815 employere in this area, whoee taffs averaged 183,415 during 1942. In 1941, the 1.785 11mm furaishing information had indicated an average of 170,135 workers. The latest annusi index was 135.6 , as compared with 126.6 in 1941, a figure which had closely approximated the previous matimum of 126.3 in 1929. During the year under review, there were seven monthiy increases. The number of persons added to the payrolls on these occasions was considarable, slthough the monthly gains in the year under review, in aumber and in oxtont, were not oqual to those in 1941.

The omployees in recoried emplogment during 1942 were reperted to have arned an average of $\$ 5,284,620$ per woek. The annul per capita avarage was $\$ 28.80$; this 11 gure showed ralatively little variation during the year. Where the index muber of employment rose by 10.6 p.c. from Jum 1, 1941, to Dnc. 1, 1942, thet of payrolls increased by 26.6 p.c. in the same period. In this area, the reported emplosment and payrolis in 1942 constituted practically even percenteges of the Dominion totals, $10.5 \mathrm{p.c}$. . of the number of employees and $10.6 \mathrm{p} . \mathrm{c}$. of the aggregate payrolis being roported in Manltoba, Saslatchewan and ilborta, takon as a unit. If informetion were available for agricultural workers, it is prohable that these proportions to the Canadian aggregaten would vary.

The index number of employment in manufacturing in the Prairies rose from an average of 141.8 in 1941 to 170.7 in 1942. Textile, iron and stenl and certain other manufacturing ostablishmonts provided vork for larger numbers of workers, but lumber and pulp and paper mills were quieter. There wan also falling-off as compared with 1941 in trade, logging and construction and maintenance, while mining, comunications, tranportation and ervicse showed a hecher level of activity.

Of the total number of employees reported, on the arerage, in $1942,86,689$ belonged In Manitoba, 34,960 in Sambatchowan and 61,766 in ilberta. Pmployment in each of these prorimes was bricker thas in 1941 or carlier yeare for which data were eagregated for the three provinces in this area.

## 4. B-1tieh Columb.

Tha the firnt of Jobruary in 1942, ampoyment in Britich Columbia teadily mounted, in the longest period of continuous expenilion on record; the month-to-month increases wore also grenter than in selier jears. The emplojees of the 1,3 ? 9 115me whoso returns vore tabulated avoraged 152,586 . The index number rose from 135.6 in 1941 to 164.8 in the year under roview. This adrance of $21 \frac{1}{2}$ p.c. was greater than in ang other province.

## EMPIOYMENT IN LEADING CIIIIS

Manupacturing in British Columbia showed particularly marked improvement, the annual 1ndex, at 230.4 , showing a gain of 39.7 p.c. From 1941. The 1942 ifgure was higher than that in any other province. Most branches of manufacturing in British Columisa showed greater activity, but the increase in iron and stoel was particriarly outstandine, as the shiphuilding programe reached new stagas of developmant. The man indexin the ircn and steel divisions as a Whole was 725.4. as compered with 268.5 in 1941; the Dominion average for this group in the year mier review was 286.2. Poploment in all the non-manufacturing industries, except mining, averaged higher in 1942 than in anv earlier vaar, although in some cases, notably logging, transportation and services, the increase were silght.

In the period from June 1, 1941, to Dec. 1, 1942, the general index of payrolls rose by 69.6 p.c.. while that of ereployment increased by 38.9 p.c. The general per capita average, at $\$ 31.28$, was Higher than in any other province. Diring 1942, the firms in British Columbia omployed $8.8 \mathrm{p}, \mathrm{c}$. of the total number of employees reported generaliv in the eight leading industries, and disburend 9.6 p.c. of the recorded payrolls.

## 3. - TMPLOKMET BI CITISS.

For many yeare, tatistics have been sogregated for the olght leading induatrial centres - Kontreal, Quebec, Foronto, Ottawa, Hemilton, Windear, Winnipeg and Vancouver. During the year under review, as in 1941, actifity in thoee centres as a unft was accelorated more repidiy than in the Dominion as whole, al though the rate was not equal to that of the year before. The composite index for the cities rose from 149.0 in 1941, to 177.7 in 1942, or by 19.3 p.c.iin the smaller centres and rurel areas in the Dnminion, there was an increase of 10.1 p.c., while the general gain in Canada as a whole was 14.1 p.c. In 1941, there had been an advance of 22.6 p.c. In the Dominion, resulting from a rise of $25.3 \mathrm{p} . \mathrm{c}$. In the larger cities and of 21 p.c. in the soller centres and the maral areas. Agriculture is of course sxcluded in all cases from the monthly surveys. This is the first vear in the dacade in which employment in the cities as a unit reached a higher level in relation to the 1926 average, than vas racorded in the other parts of Cenack. The cities' index in 1942 was 177.7 , four points higher than that of 173.7. in the Dowinion as a whole.

The table below show that in the vars before 1933, amployment was rather more active in relation to the 1926 level, than in Canada as a whole, although the differance was not marked. Comencing wth 1933, hovever, the industrlal dopreselon affocted the situation in the cities to a greater oxtent than was the case in the maller contres and the rural areas. This was due partly to the fact that the production of heavy goods, to a considerable extent concentrated in the lerger centres of population, was more drattically curtailed than that of consumers' goods. while the location of worke undertaicen for the reliof of unemplomemt in the depression yeare was largely outcide the cities. Still another factor was the fact that, in general, emplonment in the industries normally located outaide the cities, such as mining and logging, continued at a highor level in relation to the 1926 baic average, during the depression years, than employment in may other industries.

From the outbreak of wer, the dieparity in the index of amplogment in the Dominion as a whole and that in the elght lading cities diminishod, until in 1941 it was reduced to 3.3 pointe, etill in favour of the Canade 11 gures ; in 1942, hovever, the ituation was reversed, the citios index being esveral pointe higher. The extremely high level of activity prevailing in manufacturing in the citise is largely responsiblo for this revereal of the trends as indicated in wore recent yeari.

The following are the annual index numbers of employment in Canada, in the eight leading cities and in other parte of the Dominion, since 1928: (1926m10n).

| Tear | Canada | Heht Leeding Cities | Hesunere |
| :---: | :---: | :---: | :---: |
| 1929 | 119.0 | 119.3 | 118.9 |
| 1930 | 113.4 | 114.2 | 112.9 |
| 1931 | 102.5 | 104.3 | 101.1 |
| 1932 | 87.5 | 90.2 | 85.3 |
| 1933 | 83.4 | 83.0 | 83.7 |
| 1934 | 96.0 | 88.2 | 102.1 |
| 1935 | 99.4 | 93.1 | 104.5 |
| 1936 | 103.7 | 97.7 | 708.4 |
| 1937 | 114.1 | 105.8 | 120.8 |
| 1938 | 111.8 | 105.7 | 116.7 |
| 1939 | 113.9 | 107.8 | 118.8 |
| 1940 | 124.2 | 118.9 | 128.1 |
| 1941 | 152.3 | 149.0 | 155.0 |
| 1942 | 173.7 | 177.7 | 170.7 |

The index number of employnont in manufacturing in the oight leading citios taken as a unit averaged 213.0 in 1942 , as compared $w$ th 206.5 in Canada as a wole. As compared with 1941, there was an incroase of $27.2 \mathrm{p} . \mathrm{c}$. In omplogment in mamfacturing in the citios. as compared with $22.6 \mathrm{p} . \mathrm{c}$. In the Dominion as a whole. Boployment in may induterisl groupt also showed more rapld expansion in the larger centres during the fear under reviev than vat elsewhere recorded.

During 1942, approxinately 52 p.c. of the pernons in recorded employment in manufacturing in the Dominion belonged in the eight leading cities, a proportion ilightiv oxeeding that of 51 p.c. In 1941. Another fact which may be of interest in this comnection is that the number of fomales in manufacturing in the sight leading cities at Oct. 1 , 1942, conetituted 59.8 p.c. of the Dominion total for the manufacturing group as reported by the flras making returns. Trado, services and commications in the cities also reported dieproportionately large percentages of the total number of persons reported by the comoperating firas in these industries, together with sven larger proportions of the total fomale amployees.

The following table shows index number of employment for 1941 - 1942 in the ofgt lending cities and in the Dominion as whole. in cortain induetries.

TABIX IV. - AYRPAGE INDKX NUMBERS OF EMPLOMERT IN CMREAN IRDUSTRIAL GROUPS IN THE DOMINION AWD IN PHE LMADING INDUSTRLAI CITISS AS A KHON. ID 1941 AD 1942.

|  | Bight <br> Leading <br> Cities | Dominion | Bight Lasding Citios | Dominion |
| :---: | :---: | :---: | :---: | :---: |
| Manufacturing | 167.5 | 168.4 | 213.0 | 206.5 |
| Communication | 79.9 | 96.5 | 83.5 | 103.7 |
| Construction | 88.9 | 126.6 | 94.0 | 130.3 |
| Building | 105.5 | 139.5 | 116.8 | 158.0 |
| Services | 156.4 | 167.5 | 167.1 | 178.8 |
| Trade | 147.7 | 156.5 | 147.1 | 156.1 |
| Bight Loeding Industrios | 149.0 | 152.3 | 177.7 | 173.7 |

The following paragraphs doal briefly wth the oituation in the eight leading cities during the year under review.

1. Montreal.

During 1942, Indumtrial mployment in Montroal shoved only two generml doclinot, the trend having been upward between Mar. 1 and Dec. 1 , Incluelve; the number of pertont added to
the reported working forceo was maller than in 1941, whon the period of expansion had extonded uvar elevon, rather than ton month. Hovertheleec, activity 18 the jear under roviow raached suocessito now all-time highe from Apr. 2. The staffe averaged 254,135 in 1,916 entablisheantes the annual index wae 167.4. The roported amplogeon rarind from 235,441 at Pob. 1 to 275,848 at Doc. 1. In 1941, the maximum, also indicated at the boginninc of December, had been 342,327; the co-oparating 1 rme had averaged 1,836 , and the amployes., 216,989 , wile the nean inder bad bees 142.7 .

With only one oxception, manufacturing operatione increaned steadily from month to month during 2942, when sctivity reached now hlgh levels. the index aroraged 199.7 p.c. of the 1926 average, oxceeding by 22.7 p.c. the 1941 mean of 162.7 . This percartage gain vee precticelly the same a that indicated in manufacturing ae a whole in tho Dominion. However, amployment in these industrise in Montreal contiaued at rather lower lovel in relatios to the 1826 average than in the province of Quobec, or Canada as a wholo.

Alhough there wao some curtailmant in omployment in cortalin branches of manufacturing in the latter part of 1942 as compared with the same monthe of the proceding yeer, the index numbers in all groupe wore higher on the averago. Particularly marked galas vere choma in 1 ron and teel and chonical manufacturing. Textile, tobacco and beverage factorien also showed important sdvances. Improvement on amich smallor scale wat noted in commicatione, constraction and maintenance and trade, the gain in the laot-mamed belag ilight.

The payrolls reported by the co-operating 11 mm in Montreal areraged $\$ 7,123,995$ in 1942, when the typical vorker in recorded uploymont recoived an average of $\$ 27.97$ per veck ; in 1941, the veokly figure had been $\$ 25.51$. The increase in parrolis in Montreal in the peried for which statistice are avalable rather exceeded that in the Dominion an wole; at Doo. 1. 1942, the index wae higher by 56.8 p.c. than at Jine 1,1941 , a percentage wifch compared favourably w th the rise of $44.3 \mathrm{p}, \mathrm{c}$. is the general indox of parrolle. During the sane poriod, the index of employment in Montreal gained by 28.8 p.c. and that in Canada an a whole by 28 p.c. During the twolve monthe, the number of vorkers reported in Montreal made up 14.6 p.c. of the total in recorded emplovment in the eight leading industries, while the roported carninge constituted $14.3 \mathrm{p} . \mathrm{c}$. of the total.

## 2. Suobec.

Important expansion was noted dumng 1942 in Quebec City, where the staffe of the 227 co-operating emplogers rose unisterruptediy from 27,242 at Jan. 1, to 36,349 at the boginning of Dacember, avaraging 31,601 in the year. Tho annual index wan 223.2 . In 1941, the 218 frme furnishing data har indicated an average of 23,256 omployeen; the man indax had been 167.8, previonaly the maximum 1igure in the record of 20 yeart. The trend of employment in mannfaoturing was decidediy favourable; the index avoraged $288.1,48.3$ p.c. higher than in 1941. Thie increase oxceeded that hown by manufacturing in the Dominion as a whole. Mot of the gais reoultad from vartime production. Ifttle general chenge was roported in the noz-manufacturing inductries in the jear under reviow.

The payrolls disbursed by the co-operating eetablishmente averaged $\$ 743,944$; the per caplta average was $\$ 23.41$. In the period of obeervation in 1941, the average had been $\$ 21.46$. These figures are rather below the Domplon averagos, partiy bocauce of the employnent of an unueually large proportion of femaln labour; at Oct. 1, 1942, women workers conetituted 352 per thoucand pereon employed by the reporting firme. The Dominion proportion mee 235 per thousand. From June 1 of 1941, to Dec. 1, 1942, the index of parrolls in Quabec rose by 92.3 p.c., acoanpanying a gain of 55.2 p.c. In employment in the anmo poriod.

## 3. Foronto.

In Poronto recorded amployment rose by 15.7 p.0. frow Jan. 1 to Doc. 1, an adrance which wae rather greater than the general Dominion-wide gain of $12.5 \mathrm{p}, 0$. Tho accompanyinc increase in the roported aggregate parrolis in Toronto in the tweive monthe amounted to 33.1 p.0.: that in the Dominion as a whole was $28.5 \mathrm{p}, \mathrm{c}$. Information was recolved from 1,967 firn , whose employee averaged 231,629 . The aunul indox was 180.2. In 1941, 1,878 eetabliehmente hed reported a mean of 196,760 vorker and the index had avereged 152.9.

The payrolls of those in recorded employnant in the year under reviow averaced $\$ 6,851,003$, a per capita figure of \$29.54. This wae highor than the Dominion avorage of \$28. 86. In 1941, the average per employee had ben $\$ 27.32$ in the perfod for hich data were avallable. Those in recorded amployment in Toronto constitutsd $1 \pi 1942,13.3$ p.c. of the Dominion total, and recelved $13.8 \mathrm{p} . \mathrm{C}$. of the segregato voekly payroll disbursed by the etablishmate in the olcht leading industris..

Thers vere inpressive gains in manufacturing in Foronto in the jear under review, van the annul indsx, at 207.1, was 26.2 p.c. higher than in 1941, proviously the maxivin. The latest average sighty oxcesded the Doainion mean of 206.5. Farticularly large gaine vore ohown in iron and oteel plants and in those producing aciontific instramente for vartime une. Smaller incrages were noted in lood, printing and publiuhing, toxtils and other factories, although in some cases a lackning beceme evident in the latter nonthe of the year. Contruction and trade were generally quioter, while moderate improvement was indicated in traneportation, commications and mervices.

## 4. Ottane.

On the whole, industrial amployment in Ottawa wa brinker in 1942 than in the preced ing year, the latest annual index being 161.9, as compared with 149.2 in 1941. The men and women on the stafis of the 249 reporting lirme averaged 31,348, varying from 22,500 at Fib. 1. to 20,633 at the beginning of May. In 1941, 241 entablimhent had indicated a mean of 19,816 employees; employment in the lant two monthe of that year, howver, was highre than at for. 1 and Dec. 1, 1942.

Lumber mille reported maller vorking forces, but pulp and pepor and other factoriet shoved moderate improvement. Trade and construction also roported a higher level of omplogment than in 1941.

The payrolle of the firms co-operating in Ottawa averagod \$539.854; the average per employe was $\$ 25.39$, 2e compared with $\$ 24.14$ in 1941. The index of aggregate payrolls rose by 25.3 p.c. from June 1. 1941, to Dec. 1. 1942 , in which period there vas an incranse of 8.4 p.c. 1n recorded amployment.

In addition to the persons employed by induetrial firme, the Dominion Gorernment had on its payroll in Ottawa approxdmately 31,214 men and women in December, 1942 , compared with 24,028 in the same month of 1941, 19,322 in 1940 and 13,015 in 1939. The persors empioymd in December, 1942, were paid $\$ 3,979,017$ in monthly selaries and wages: the lateat 1igurs are eubject to revision.

## 5. Haviltor.

Jurther important expansion was Indicated in Hamiltor during 1948, the Index, at 186.6, was 17 p.c. ahove the 1941 figure of 159.5 . Data were furnished by 348 firme whoss workiac forces averaged 60,922 , varying $150 m 58,267$ at Jan. 1 , to 63,592 at Dec. 1 . In 1941, a nean of 52,021 employes was indicatsd, whil the annual index was 159.5. The persone in recorded anplogment in the year under review were pald weakly salarlos and wages averaging $\$ 1,909,242$, an average of $\$ 31.32$ per employee. In the period for which information was furmithed in 1941 , the por capita average vas $\$ 28.71$. These figures were higher than those gonerally indicated in the Dominion, malniy because of the unusually large proportion of worker: in the heary manufacturing industries in Famsiton. A result of this distribution is seen in the fact that in 1943, 3.5 p.c. of all workers in the oight leading cities were reported by firms in Mamilon, but their payroll. mad up 3.8 p.c. of the total of salarles and wages disbureed by these amploymen.

There were nine monthly incrsase in amployment in manufacturing during 1942, when the index, at 197.9 , was higher by $19.6 \mathrm{p} . \mathrm{c}$. than in 1941. Ittis general change from the year befor was ohow in taxtiles. Iron and steel. electrical apparatus and come other difisions, however, reported important gains. Among the non-manufacturing classes, construction and trade were quieter than in 1941, although employment continuad in greater volume than in immadiatoly preceding years; in trade, indeod, the index in 1942 was axceoded only by that for 1941.

## 6. Windsor.

Intenes induatrial activity continued in Winisor, according to statistics received from 204 establi bments with an average staff of 38,388 men and women. The index was 282.5 24.3 p.c. above that of 227.3 in 1941, when the reported forces had avaraged 31,117 . In the your under review, the weokly pay envelope of those in recorded employment in Hindsor contained $\$ 39.22$, \& figure which compared favourably with that of $\$ 36.82$ in the period June 1 - Dec. 1. 1941, and was higher than in any other of the cities for which data are segrogated. The salaries and wegen reported in 1942 averaged $\$ 1,508,325$ per weok. The explanation of the unugually high earning in Hindsor, as in Hamilton, lies in the concentration of workers in the heavy industries: thus. $78 \mathrm{p} . \mathrm{c}$. of those in the payroll of the firms co-operating in the survey for Dec. 1 beloaged In the manufacture of $1 r 0 n$ and steel products, \&s compared with a proportion of 30 p. p.c. In Ontario, and $24 \mathrm{p}, \mathrm{c}$. In the Dominion at the saw dato.

Although the per capita veekly oarnings in Winisor considerably exceeded the average, the index of payrolls from June, 1941, to Doc. 1, 1942, had risen by 45.8 p.c., a proportion only slightly above the general averags of $44.3 \mathrm{p} . \mathrm{c}$. ; between those two ame datas, omployment in the city had increased by 35.5 p.c.

Manufacturing in Vindsor afforded mployment to many mors persons in 1942 than in 1941, or any earlier yoar. The index of amployment averaged 322.8, boing shetantially higher than in any other of the citios whose statistics aro segregated, except Vancouver, Although particularly marked gaine were noted in factories tuming nut iron and steel products. other classes of manum facturing also showed important expansion in the year under refiev. Moderate gains were noted in construct1on.

## 7. Minnipeg.

The trend of amployent was upward in Winnipeg during 1942, resulting in the establishment of a now all-tims high leval of activity; this, however, was lover than that indicated in the other larger centres. To some extent, the industrial distribution is responeible for this ituntion in Winnipeg, where the proportion of workers in trade is absormally high, and that in manufacturing, wusualiy low. More recent wartime trends, in reacting advorsely in regard to trad and particularly favourably in regard to manufacturing, have had the effect of producing a lese-than-average increase in general employnent in Winnipeg. The 560 firms furnishing data roported an average working force of 55,212 men and womon, sarning a weekly payroll of $\$ 1,494,916$ In 1942. This was an avorage of $\$ 27.06$ per employes. In the period of observation in the year before, the per capita was $\$ 25.43$.

Batod on the 1926 average as 100 , the latest indox was 132.4 , as compared with 122.8 In 1941. The previous madmam ws 112.3. In 1929. From the intitution of the payroll record at Jume 1,2941 , the indox has sison by $26.2 \mathrm{p}, \mathrm{c}$. , accompeaying the gain of $14 \mathrm{p}, \mathrm{c}$. In omployment in the sane period.

Considerable improvement was noted in manufacturing in Winnipeg in the vear under review, when the index at 165.5 , was practically 20 p.c. higher than in 1941. The animal food, toxtile, iron and teel and chemical industrien wers decidedir nore active. On the other hard, moderate curtailaent was indicated in trade, construction and transportation.

## 8. Vancouver.

Thployment in Vancouver reachod an unprecedentediy great volume during 1942. Most of the upwerd movement took place in iron and steel plants, notably in shipyards. The lumber group reported conilderable galne in the early monthe of the yoar, but was later on serfously affected by the shortage of labour and omployment gonerally was lover than in 1941. In comunications, construction, eorfices and trade, the index numbers wero highor in the year under review. Transportation, hovever, was quieter.

Draring 1942, the 603 co-operating amployers reported a personnel of 72,520, on the average. Tho annual index was 205.0. This wai 39.6 p.c. higher than the mean of 146.8 in 1941, when the 582 PIF whose returas wore tabulated had an avorage of 51.284 amployees. The weekly parrolis in the gear under roview averagod $\$ 2,220,112$, giving a per capita figure of $\$ 30.39$.

Chort 12
COMPARISON OF IMPIOYMENT TRENDS IN THE MANLFACTURING, TRANSPORTATION AND TRADE INDUSTRIES FIVE ECONOMIC ARE AS AND THE DOMINION AS A WHOLE

1926-1942

In the pariod for wich data are avallable in 1941 , the average was $\$ 26.78$ per pereor in reoorded employment. The payrolle reported in Venoonver have ahown unusally improseive gaine, ascomjenying the large incrosee in emplovment; thus from June 1, 1941 to Doc. 1, 1948, the index of payrolls rose by $115.9 \mathrm{p.c}$. and that of mployment by 20.8 p.c.

## Inder Numbere in Ildht Leadiug Citian.

Statistics for the cities are given in Tables 2, 7and 9. Ohart 11 11lutretes the fluctuatious of employment in the largor controe during the lat fow yeare, the curvse bsing based unon the figures given in Table 2.

## 4. - COMPARISON OI THE COTRSE OF PMFLONDMN IN VARIOUS IEDUERIRS AND UNITS OR POPULATION.

1. Industrial Comparison within the Fivo Iconomic Arean.

The trend of amploynent in manufacturing, transportation and trade in the five conomic areas, in comparison with the movsmente in the Dominion as a whole, are depleted in Chart 18 in the parlod from 1925. These show that the curves in manufacture have, over a longthy period, been quite eimilarin their ma,for movemente; this lmilarfty is of more than paseing intarest when the variatione in the induetrial distribution of the forsons engeged in manufocturing from Tast to West are taken into consideration. Thus, the general upswing to 1929 wae followod by a curtailment that also was without interruption, until the dopression in the Dominion, and in four of the five conomic areas, reached it lowet point in 1933; in Britieh Columbla, howerer, the minimum, 28 in the United States, was in 1932.

From the trongts in the dopression vears in the early $1930^{\prime} \mathrm{m}$, manufactiriag eonerally showod stoady revival to 293?, when the second high point in industrial activity in the period of observation was indicated. Tho upward movement, whose boginning more or lees colncided with the declarstion of war in Septemher, 1939, developed in strength in 1941 and 1942. In the latter, now peaks of amplowent ware established in all provinces. The curves in gubec and British Columbia surpessed that for Canada as a whole; that in Ontarlo was sightly lower, while the curves in the Karitime and Prairio Provinces wore below the Ontario inne. The sovement in the Prairie area was not quite so sharply upward as that in the other areas depletad in the chart.

Boployment in tranaportation in the variou saction of Canada has also shom a fait measure of uniformity over the many years, elthough the sinilarity in movemonts is rather lese etriking than that in manufacturing. The curves for the Mestern areas were persietently above that for tho Dominion as a whole, while thoso for the Maritime Provinces, Quebec and Ontario were generally lover until the closs of 1940. In the two succeeding years, pronounced activty In the Rastern Ports ralsed the Maritiog curve to a position considerably above the averege. The Ievel in the Preirio Area also continued ahove that in Canada as a wholo, while tho curroe in Queboc, Ontario and British Columbla were rather lower, although the trend continuad favourabla.

The third part of Chart 12 daplcts the 1 tuation in trading otabliabments. The momentum geined in immediatoly preceding years had carried employment in trade to genermily higher level in 1930 than in 1929. Howover, commencing with 1931, activity, sffected by the generel contraction in industrial payrolis, showed a slowing dow, which oxtonded into 1933. Sinco thon the trend in tred hat been almost continuously farourable in all five aconomic aroas. Sthe oxtremely large volume of purchating power associated with generelly iacreased employmont and sarninge throughout the Dominion following the outbreak of war, resulted in the establiehment of new high levele of amplosment in 1941; in 1942, hovever, shortages of labour, together in csrtain cases with shortages of commodities, brought about som curtaliment, and the curves in the Dominion as whole, and in Ontario and the Prifie Provinces, slighty doclinod from their $1941 \mathrm{high} p o 1 t 10 \mathrm{n}$; in the Maritims Provincos, Qubbec and Britioh Columbia, howevor, the tronde continued upward, altering the similarity which had characterised the general movemonte of amployment in trade in the various areas for a number of ymars. If the curves wore plotted on a monthly basis, however, a greater degree of uniformity would racently be indicated, since actiFity in trade in all five arean was quieter in the latter months of 1942 than in the same part of 1941.

## 2. Comparison of the Coures of Rnnlnyment in the Five Bconomic Areas and in the Dominion

Chart 13 illutratee the course of employment ance 1925 in the five aconomic areas, in relation to that in Canada a whols, and shows tivat over a lengthy period employnent in the different part. of the Dominion has reacted in mrch the same dagree to the general factore governing businsse. The deviatione which are indicated are mainly due to the varying industrial distributione sxisting in the different arnas. For example, the general cirve in British Columbia for many year was below the avorage, for the reason that mining and logging, (particularly important sources of amploynent for industrial workers in that province) were relatively quietsr there than elsewhere in the Dominion, while in 1942, activity in traneportation and conetruction we below the general level. The depreseing offect of many unatisfactory crop and marketing vears since 1929 wat reflected in the lower position of the curve for the pre-dominantly-Gricultural Praisio Provinces; much of the general advance in employment olnce the outbrack of bostilitios bas takn place in manufacturing, which flgures much iass prominenily in the industrial तistribution in the Frairie Provinces than in Canada as a whole. Since 1939, the direction of the curves has been generally upvard in all areas; although that in British Columbs showed tho most sharply upward movement in 9942 , the line nevertheless continued lower than that in any other area except ths Frairies. The highest porition was reached in Quebec and Ontario, rsflecting the intense activity in manufacturing in thece more highly induetrialised provinces roeulting from wartime requirements.

Problem arising from wartime labour conditions omphanized the nead for up-to-dats information reapecting the sex distribution of the persons employed by the co-operating establishmente, whose working forcen gonernly compriss the great matorlty of wage-earners in the induetrie inciuded in the surveye. dccordingly, the monthly enquiry for Oct. 1,1942 , wes oxtended to ank for a tatement of the sumber of fomales thon on the pavrolls of the firns furnishing data.

The survey showed that in the nine leading indistries, (manufacturing, logging, mining. comunication, transportation, cozstruction and maintenance, services, trade and finance), wers amployed 441,156 women, a nuber which constituted $23.5 \mathrm{p}, \mathrm{c}$. of the total of $1,879,845$ pertone of both sexel in recordsd employment st the beginaing of October. The proportione of female vorkers varisd from $13.3 \mathrm{p} . \mathrm{c}$. in the Masitime Provinces and $16.5 \mathrm{p} . \mathrm{c}$. in British Columbia, to 26.7 p.c. in Ontario, whare 208,200 of the indicated employees were women. This muber made up over 47 p.c. of the total females in recorded omployment in the Dominion at Oct. 1. 1942.

The statistics al so revenled a marked concentration of famale workers in the larger cition, the ifgt centres for vich data are regularly tabulated accounting for almot 60 p.c. of the totel nuber employed by the sstablimbents reporting throughout the Dominion: this proportion is very much higher than that of 45.1 p.e. at Oct. 1,1942 , for workers of both sexes. The ratio of female workers vas highot in Ottawe and Toronto, where they constituted 37.2 p.c. and 36.6 p.c.. resopctively, of the totals in the uine main indutrial groups. In Montreal. the percentage wes 31.7. In Tancouver and Windeor, on the other hand, the proportione ware below-ararage, 21.3 p.c. of the total roported in the former bilgg woinen and girls, whils in Vindeor the ratio mee only 14.9 p.c.

In the manufacturing division, the proportion of female workers was 25.7 p.c.i when contral elsctric stations ars oxcluded irom manufacturing, the ratio rises to 26 p.c. Thene figure zan be compared with that of $21.8 \mathrm{p} . \mathrm{c}$. according to the Annual Censue of Induntry for 1940 and 22.6 p.c. in 1941; in the former the proportion was not altered by the inclusion of data for contral electric station, whil in 1941 the ratio was 22.3 p.c. whon the electric light and pover figures were included. In riow of the fact thet the maller induetrial ostabliehmonte co-operating in the Annul Cousus, but not in the montbly eurveyn on emplovment and payrelle. probably tond to employ a greaternthan-average proportion of female labour, the growth indicatod by thi comparimon is highly wigenficant.

Vithin the manufacturing group, the ratto of fomales at Oct. 1,1942 , ranged from 2.2 p.c. in teel ohipbuilding, 6.1 in pulp and paper milis, and 6.4 p.c. in rouch and dressed lumber mills, to $64.1 \mathrm{p} . \mathrm{c}$. In hosiery and knit good., 66.4 p.c. in tobacco, and $66.5 \mathrm{p} . \mathrm{c}$. In garmonts and personal furniehinge.

The proportions of vomen employed in construction and maintanance, locsing and alaing wer low, being two p.c. or under. In transportation, the ratio was 5 p.c., vhile in the remaining industries - comunications, eorvices, trade and finance - the fomale voricers conotituted subetantial proportions of the total. The largest of theee wat that of 51.6 p.c. In services. In each of the non-manufacturing industries, the percentage of female labour mae considarably higher than that indicated in the 1931 Dacanaial Consus, whose data vere the latest available for comparetive purposes at the time of vriting.

The appendix to the bulletin $1 /$ on omployment and payrolle for oct. 1. 1942, gave statietice $1 n$ eone detall for the various industriee, economic areas and leedine cities, together with comparative material available in variou branchse in the Bureau.

## 6. - THE COURSI OF RBCORDTD PMPLONANT IN COLPARISON WITH THS COURSZ OI PORULATIOI.

Chart 14 depicts the trends of recorded employment and of recorded or eetimeted popalation the crude figures of population have been plotted in the absence of current or recent tatistics respgctiag the distribution of the total mage-arners in tho Dominion. Cortain preliminary data are now avallable from the 1941 Decennial Consus, but not in mificient detail to permit satisfactory comparison with the current statistice.

The graph show that from 1920 until the outbreak of war, the yeare in which the index 01 amployment was at a higher level than that of gereral population vere relativoly fow, conter ing around the boom which reachod its high point in 1929. The depresion setting in imediately thereafter, substantially lowered the curve of omployment, which decilned to an stent conelderably exceoding the gain it had hown in preceding year..

From the 1933 low point, the curve of nmpioyment rose in a movement which broxelht it, by 1937, to a position only ilightly distant from that of population. In 1938, howovar, a slowing up in aployment wes indicated, while the growth in population continued. In 1939, the two curver were almost parallel, while from 1940, unprecedented oxpansion in industrial activity resulting from wartime conditione he raised the curve of employment to a level very decidedily above that of population. The distance by which the former curse oxcesds the latter at the ond of the war will provide a rough measuroment of the magnitude of many of the probleme involvid in the return to normalcy.

The acceselone to the numbers in recorded employment during the war have come from everal sources, and, whon considered with the figure of approximately 600,000 person now in the armed forcen, indicat etupendous change in the industrial and occupational dietributions of the gainfully-occupied population. Among the more important souree which have contributed to the large number of pertons aborbed in recorded employment and in the varlou ective esvices, may be mentioned the following: (a) unomployed workere, (b) own-accourt and trellomployer classes, (c) agriculture, (d) domestic woricert, (e) home-makers and other women, who under ordinary circumstances, would not meek gadnful amployment. (f) adolescants, who mormaily would probably continue at chool for a year or two longer, or posibly for a lengthier period, (g) older men and women, who are prolonging their period of eervice beyond the ueval retiresent age. The armed forces have, of couree, alno rectatted large nunbere of persone from thelr former omployment in industry.
sccording to a study $3 / \mathrm{based}$ on a ten p.c. semple of the Consu rotume, the number of wago-eamers at work in all industries in Canada at the Censu date we $2,542,440$; this figure

$1 /$ Copies may bs obtained from the Dominion Burau of Statistics.

employment in manufacturing canada and united stales

$$
1939-1942
$$

and payroils, such as agricultural workers, तomentic servants, profersional workers, (e.g. toachers, public sorvants, employons of hospitals, otc.). At Junn 1,1941 , the firms furnishing monthly data to the Boloyment statistice Branch, ranorted a combinod working force of $1,588,000$ men and women. This ifgure conetituted 62l p.c. of the total number of wago-earmers at work at the consus date; when the census tatistlca are tabulated in greater detall, it will be possible to establish the coverage of omplovees in the various industrien for which current data are available. In the meantime, it can eafelv be etater that thair proportion in the industries covered is considerably highar than that of 6\% D.C. resultink from the comparison with the total number of wagomearmer at work at the censins date. With the cossation of hostilities, the raostablishment of a normal industrial, occupational and sex distribution among the workers included in the current gurveys, together with the ramaborotion of damobilizad mambers of the armed forces in peace-time purgults (largaly among the induatias of which there is current record). will obviousiy constitute mroblams of maramnunt national importance. An indication of the progress then being made in the solution of sone of these problems will be found in the course of the current statistics of employment.

## 7. - COMPARISON OF THE COUREE OT RMPLOMMSNE IN WNTFACTIRINO IN CANADA AND THR TNITHD STAMES.

Statistios of employment in manufactiring are currentiy tabuiated in the Thited States, as in Camada. The scope of the enquiries, the methods followed in complilng the inta, and the basic periods used in calculating the indexes in the two countries differ, while there are also important isfferences between the two indurtinn cinsalfications and groupings. The latest American indexes are computed from the estimates of the total number of wace-anrners in manufacturing rather than directly from the numers omployed by cartain, numernise establishmants. The statistics in the Dominion are those currently fumished by establishments with 15 employees and over, but cover an oxtremely large proportion of thosa engaged in manufacturing industrios. I/ They include malaried omploynes as woll as wape-earners, and in this respect, probably take in a greater proportion of the total number on the pavroils of the indifidual co-operating establishments than is the case in the States. However, the indefintte nature of these tems as commonly uese, makes extremely difficult any distinction betwoen the two classes in so many cares that the importance of this factor cannot be gauged. While there are too many poselble differences in the etatistics tabulated in the two countries to permit comparisons in any detail, enough correspondence no doubt exists to make possibio feneral comparisnas of gome interest and sienificance.

The base period at prosent used in calculating the Doninion indexes of employment is the 1926 avorage, while the Auorican manufacturing inderes are now calculated on the average for 1939 as 100. Accordingly, the Canadian figures have been converted to the 7939 base ab 100. to facilitate the comparisons. Since the index in that yaar was 111.8 p.c. $2 /$ of the 1926 average, the conversion lovers the Dominion indoxes as currentip publisher. The curves of employnant in sanufacturing in the two countries from 1938 are dopicted in Chart 15 which shows that ince thon, the couree of omplovment in Canada and the Jnitod States has haon definitely upward, in movements imilar in ilrection, but differing in magnitude. To some extent, the greater growth dopicted ia the Dominion may he तum to the fact that the numers of worker involved are smaller than those in the United States, so that the effect of the flucturtions is more ersily discerned. Another factor is Canada' garticipation in the war from the outbreak of hostilities in 1939, whereas the American declaration of war came over two poare later. The importance of the latter point is perhaps emphasised by the rather gronter correspondence in the general movement, a of the curven in 1942, whon hoth countries wore at war, than in any of the oarlior vana dedcten.

1/ In 1941, over 87 p.c. of the total number of emplovens rnported to the Annual Census of Manufactures were on the payrolls of the firme comoperating in the monthis survere. It is probable that as a result of wartime conditions, this proportion will since have incraaped. (See aleo Section 15).
2/ For the comparieons made in this study of conditions in the two cointries, the figures of amployment in olectric light and power have been oliminated from the Canadian index for gataral manufacturiag, to increase comparability with the Amorican figures. Sventually, this stop will also be taken in respect of the manufacturing indexes for the provinces and citine, in conformity with the practice now also in force in the Dominion Bureau of Statiatics.

EMPLOYMENT IN DURABLE AND NON-DL RABLE CLASSES

## MANUFACTURED GOODS

IN

CANADA and the UNITED STATES
$1939-1942$

The curves plotted in Chart 16 aleo show an interesting situation, tracing the couree of employment in Canadian and Aaorican plants twning out durable and non-durable goods. Particularly striking is the teoply upward movoment in the durabla goode division in the Dominion, paralleled in 1942 by that shom by the Aserican line for the same industries, although the lattor was at a considerably lowor lovel.

Also marked is the general similarity in the trende in the manufacture of non-durable goods from 1939, and more ospecially in 1941 and 1942. The fact that the Canadian curve it 10 much highor than that in the United States is partiy due to the very impressive grovth in the chemical industrios in this country. If chomicals were removed from rocont Canadian and American figures, the disparity in the two countries would be decidediy less, since the vartime increase in this industry in the Dominion has, to date, greatiy excoeded that in the States. Thus, in 1942, the index of omplovment in chomical manufacturing in this country wae 432.6 p.c. of the 1939 average, as compared with the Anorican annual index of 210.9. In thenn-durable goods group, without chemicals, the Caradian index in 1942 was 130.3 , as againot 115.4 in the United State for the light manufacturing divialon whout chomicals.

Chart 17 111ustrates tho monthly movements of employment and payrolls $1 /$ in Canada and the United States in the period for which the statistics of payrolis are avalieble in this country, 1.e. from Mav, 1941. The American Indexes, which as already tated, relate to the middle of the month, have boon convorted from their original basic period of 1939 to May 15, 1941, for the comparisor. With the Cansdian ifgures, which, rolating to the lat pay period in the month, are based on the number of employes., and the payrolis diebureed on juns 1 , for eervices rendered in the last wook in May, as 100.

Although omployment has gained more rapidly in the Dominion than in the United 8 tates since the pring of 1941, the American payrolle showed a docidediy greater inc rease than has been roported by Canadian manufacturar:. Mrom May, 1941, to December, 1942, the advance in thin country amounted to $32.9 \mathrm{p} . \mathrm{c}$. In the index of amployment, and to $60.1 \mathrm{p} . \mathrm{c}$. in the ind ox of agrogate payrolls; in the United States, the increases over the same period ware 28.0 p.c. in omplogment and $78.4 \mathrm{p} . \mathrm{c}$. In phyrolls. Ae in the case of the curves of amplovment, several factors contributs to this disparity. Among these mav be mentionod (1) the greater regulation of salaries and wages in the Dominion (2) the possibility that the inclusion of salaries in the statistics tends to some oxtant to exercise a stablifing offoct upon the Canadian 1ndexes (3) the fact, mentioned in the pross, that the five-dav week has boen suppendsd in cortain industrion in the States, the time worked on the sixth dav boing pald at overtime rates; this is, of course, in addition to the substantial amounts of overtime generally worked in American factorios, an in Canadian planta. It soems probable that the first of thase three factors has beon most influontial.

## P R T 2.

## 8. - STATISTICS OF PAYBOLIS IN THE DOMINION.

Prom the spring of 1941, current 1aformation on parrolls has been collected to complement the monthly data on employmant, for which records are avallable since 1920. The many difficulties arising from the institution of any new series dependent upon the betetamatic cooperation of large numbers of firme, have been intensified in the case of the payroll record by existing wartime conditions. On the one hand, these greatly delay the collection and proparation of material, and complicate the matter of securing accurate and consiatent data, not only because of pressur of work and groatis increased demand from various sources for statistics, but also becaus of frequent changes in the personnsl of the co-oparating 11rme and in that of the noployment Statistics Branch; on the other hand, the increasingly abnormel industrial disttibution of wage-earners in wartime, and the graat changes in the amount of the payrolls. make difficult the comparisons with informetion for earlior verre against which the current data mut be measured to determine thelr reliabllity. Up to the time of writing, the only comparison posible are with the salarles and wages in manufacturing in 1941, I/ as ascortalned by the Annual Census of Industry. Such comparisons indicate a generally high level of accurncy and comparability in the monthly record for thie important group, wen differences in conditions in the intervening monthe are takon into account; novertholese, until it is posible to make com. parisons of the dats reported to the two collecting agencies in the same years, for a period of somo years, and to account for the factors contributing to the polats of difference which may oxdat, the current figures of payrolls must be regarded an more or less prelialnary.
I/ In section 15 beginning on page 51. appeare comparinon of the available data.

Chort 17
EUPLOYMENT AND PAYROLLS
MANIFACTURING IN CANADA AND THE L.SA.

The 11 ret monthly stetistics of povrolle were collectod with the omployment reports for Apr. 1, 1941. Mainly because the information obtained in the first and socond enquirles was incomplete for several important industries, the record is considered as heginning at June $1,1941$. Vory shortly after the institution of the payroll statistics, the necessity of oxpreseing the figures in the form of an index number became ovident; in order to carry the record back as far as posible, the payrolls reported at June 1, 1941, for services randered in the week preceding. ver takon as the base of this index of payrolls, and the data originally furnished have boen revised and extended for the parpose. To establish and maintain comparisons of the trend of omployment and payrolls, the indexes of amployment, on their orfginal base $1926=100$, are currently converted to the base June $1,1941=100$. For general purposes, apart from comparisons with the payroll data, the index numbers of omploynent on the 1926 base should be used.

Ths use of so hort basic perlod for the pavroll statistics, and following so briof an experieace with the data, is obviously unsatisfactory, despite the moticulous care taken to onsure the marimim accuracy ponsiblo under the circumstancos. When time pormite, more satinfactory common basic poriod will be established for the index numbers of employment and payrolls.

Tho tatistic tabulatod show the amounte disbursed by the co-oporating employers on or about the first of the month, for sorvices rendered in the week preceding. 1 /Table I on page 2 gives averages of the data roported in 1942 by provinces and in the leading cities and industrial groups. In Table $V$ are shown indexes of oaployment and parrolls monthly from June 1 , 1941. Tables 5 to 11 contain the index number and per capita averagen indicated at certain dater in 1941 and 1942.

During 1942, the co-operating emplover in the elght leading industries, with an average staff of $1,738,848$ men and vomen, reported the $i$ isbursement of an average weekly payroll of $\$ 49,717.612$. In the nine leading industries, (including finance), the indicated emplovees averagod $1,802,320$, and the payrolls, $\$ 51,634,595$ per weok; the latter implies an annual pavroll of $\$ 2,685,000,000$ distributed by leading establishments in the following industries: manufacturing, logging, mining, transportation, commanications, construction and maintenance, services, trade and finance.

Preliminary information on employment and parrolls is avalable for employees of the Dominion Government for March, 1942, when the 83,781 persons then on the Civil Service payroll threaghout the country were pald the sum of $\$ 10,247,777$ in monthly salarles and wages.

The everage woekly pay envelope of the typical individual in recorded omployment in the eight main industrial groupe contained $\$ 28.56$ in 1942 ; in the nine groups, the sverage was slighty higher, st $\$ 28.61$. In the seven month of 1941 for which information is available, the per copita weokly average in the eight industries was $\$ 26.17$. There was thus an increase of 9.1 p.c. In the weokly earninge of the typical employee of the co-operating establishmente in 1942 , as compared with his earnioge in the oerlod, Junc $1-\mathrm{Dec}$. 1,1941 . Although this gain was conildorable. it was lese than that of $16.6 \mathrm{p} . \mathrm{c}$. In the 1942 incex of aggregate payrolls ofer the same index in the period of observation in the year before. The disparity in the rates of grow th in the tro indexes is of course, due to the continued dilution of labour.

In considering the above aggregates and averages, which reflect the eernings of a very large proportion of the wago-carning population in the Dominion, it should be noted thet the payroll. reported do not include those whose carninge normally are unueualiy high, nor those in the lower-pald brackets, in which categories fall certain professional and comission workers, on the -re hand, and on the other, such classes as agricultural and domestic workers, and those employed In mall businesses whe eamings ars usually low. As a remit of wartime conditions, it is probable that the current tatistics of employment and payrolls at preeent cover a larger pro portion of the total wage-earner than would be the case in pascetime.

## 9. - THE TRAND OE PRLONAEN AND PAYROLLS IN CAFADA IN THE PERIOD JUNE 1, 1941 - DFC. 1. 1942.

Table Tives index number of employnent and parrolls in the elght leading industrial groups, and in mafecturing, in the period from June 1,1941 , when the peyroll record commencod,
1/ Tor deecription of methode in handing the statistics of pevrolln, see explanation below Table 1 on page 2.
while in Trble I on page 2 appar the anaual averages of omployeas and vookly parrells raported by the comperating firms. A briof description of the methode used in compling the currant statistice of payrolls is given under the latter table.

| Aug. 1 | 116.3 | 131.6 | 28.62 | 126.4 | 143.2 | 29.08 |
| Sopt. 1 | 117.3 | 135.3 | 29.29 | 128.3 | 148.5 | 29.72 |
| Oct. 1 | 118.6 | 137.8 | 29.51 | 129.9 | 152.5 | 30.15 |
| Nov. 1 | 119.9 | 140.6 | 29.81 | 130.1 | 155.3 | 30.70 |
| Dec. 1 | 122.0 | 144.3 | 30.06 | 132.0 | 160.1 | 31.17 |
| Average (12 months) | 113.6 | 128.3 | 28.56 | 122.9 | 140.0 | 29.18 |

In the period of obeervation, the general index of emplogrent hee finen, on the average, by 1.2 p.c. per month, whle payrolls have gelnod by 2.3 p.c. per month. Over the same period, thers has been an average monthly increaso of $1.7 \mathrm{p}, \mathrm{c}$. in employment in manfacturing, end of $3.2 \mathrm{p} . \mathrm{c}$. In payrolls. The general averago per capita earninge from Jume $1,1941$. to Dec. 1. 1942, advenced by $\$ 4.81$, or roughly 25 conts por woek, and those in manfacturimg, by $\$ 5.60$, or over 29 cent a weok,

On the average, the general index of omployment in 1942 was 13.6 p.c, higher than at June 1, 1941, while that of payrolls rose by 28.3 p.c. In manufacturing, the indor of amploymont showed a gain of 22.9 p.c., accompanying an increase of $40 \mathrm{p} . \mathrm{c}$. in the reported payrolls: the influence of war is shom in the relativaly greater growth in employment and payrolis in manufacturing than in the non-manufacturing classes as a whole. A comparison of the por caplte average veokly earaings in the all-industries classification and in manufacturing thowe in the sover monthe of observation in 1941, aisparity of 43 cents per vook in favour of the persorin employed in factories; in 1942, this disparity had Fisen to 62 conts. In fiew of the extonelvo dilution of labour indicated in the latter year, which particularly affected manufacturing, the differences in these two figures is significant; it results largely from overtite work, and from the increasing concentration of emplogment in the more highy-pald honvy indubttios.

## 10. - THE DISTRIBOTION OF THE AHEAGE NHANLI PATROLLS AND OF PHEONS IN R

The ilvifivution of the amployees and the parrolls reported by firme in the varlous areat and the loading industrial groups in 1942, (shown in Tablo I on page 2) ve: fairly equable, on the wole; in general, the variation reported in the proportions of employees and payrolls in the different provinces and cition were partiy due to the industrinl distribution of employeos within the efven unit of population. The sex and age distributions also had an important influence, whle the question of overtime and short time likewise entered into the picture. The incidence of labour disputes in industries with relatively large payrolls in a province or city may also contribute to the disparities which may the shom: an oxample of this is found in the case of Fova Scotia, where disputes in the conl-mining areas lowered the provincial payrolls on several occesione in the period of observetion.

In the citiee whose returns are segregated, the greatest disparity in the proportions of employees and parrolls in 1942 was in Mindsor, where the co-operating establishments provided work, on the arorage, for 2.2 p.c. of the total employess, and disbursed three p.c. of the aggrognte carninge. Tho olght cities taken as a unit paid out $45 \mathrm{p} . \mathrm{c}$. of the reported Dominion total of payrolls, while the omployees therein constituted $44 \mathrm{p} . \mathrm{c}$. of the totel mumber of persons in recorded employment in 1942. The veekly por capita earnings in the eight citios in the year under reviow averagod $\$ 29.27$, as compared with the Canada everage of $\$ 28.56$; in view of the highor rente and other liviag costo usually found in the larger centres of population, the differencen in the average is perhape less than would be expected.

The fact that manufacturers. with 61.9 p.c. of the reported total of omployees in 1942, distributed 63.2 p.c. of the aggregate of anleries and wages, is partiv due to the concentration prosentiv exdsting in the heavy industries, in which thare in also a considerable amount of over time werk. This clase employed 32 p.c. of the total persomnel, and peld 36.2 p.c. of the reported payrolis in 1942; in 1939, the emplovers in the heavy manufacturing industries reported 20.4 p.c. of the total vorking ferce. In mining and transportation, the payrolls were disproportionatoly largo in relation to the number of werkers, partiy because of genorally high wage rates. anseciatod also with the omploynent of prodominately male stalis, fogether with geod deal of evertime work. On the contrary, in logging, construction, services and trade, the omployeos in 1942 carned dieperpertienately mall shares of the ageregate payrells. In the lat two, the majority of the roported staff are femaloe, which ordinarily implies many workers in the gounger age classet, while there is frequeatly a centidorable proportion of part-time work. In logging and eorficee, the payrolle roported do not include the value of beard and lodging, in many ceses part of the remuneration of worker in these industries. Still anothor factor in the case of logging, is the semsonal nature of the work, and a particularly high reto of labour turnoter. Thote facters alse affectod construction, in which the ompleyees conetitutnd $9.4 \mathrm{p}, \mathrm{c}$. of the total wage-earnore roported in 1942, but their payrells made up only 8,8 p.c. of the Dominion aggregate. Anether reason contributiag to the disparity is the intermittent uature of the vork, dopondent upon weathor conditions and upon evaliable supplios of materials, while the fact that workers on highvay and railway construction and maintenance are usually paid at rates belew the general sverage in industry, also lowered the proportion of the payrolis. In 1942, those two groapi amployed $58.2 \mathrm{p} . \mathrm{c}$. of the total number in construction as whole. In commanications, the ration coincided, the industry employing $1.6 \mathrm{p} . \mathrm{c}$. of the personnel of all conoperating establisinmente in the eight leading industries, and reporting $1.6 \mathrm{p} . \mathrm{c}$. of their disbursemente in salaries and waget.
 THE LTNDIN CITIRS ADD LRADING INDUSPIRAL GROUPB, QUARTRRLT, Sept. 1, 1941 - Dec. 1, 1942.

A-bler 8,9 and 10 on paget 68,69 and 70 , show the number of amploynes and the aggregete weokly payrolis reported at apecified dater in 1941 and 1942 , by the co-operating employera in the ilve oconomic arean, the leading cities and the nine leading induntrial groups, reapectively: vio tablat also give the indsx number of employmont on thais ort ginal 192 b base ant convortad to Jume 1, 1961, an 100, the Lntter to afford comparison with the index munbors of peyrolis.

Table I on page 2 containe the 1942 evorages of crioloyees and per caplta veekiy earainga.
These tablen show thas in the period for which data are given, the gemeral movements of omployment and payrolls have beon consistontly upward in the various areas and cities. There was rather more variarion in the main industrial divisions, las sely due to the offect of wartime condition upon supplies of labour and commoditian and also, no doubt, upon possible carnings. In some intances the fluctuation taking place were seaconal in character, in the case of pay oill as of emplogment, but to date, the experience of the payroll data 1 e too ilmited to allow any determination of the extent of the seasonal variation ordinarily occurring.

## 12. - INDE MUBRRS OZ EPLOMMBYT AND PAYROLUS, EI INDUSTRIES, IN THE DOMINION, THE DOOHOMIC AREAS AND THS LRADINO CITIBS, QUARTROL, <br> JUNE 1. $1941=$ DBO. $1,1942$.

In Table 5. 6 and 7 are given index numberg of ampoynent and payrolle quarterly, from Juac 1. 1941, to Dec. 1,1942 for a conilaorable list of industries in the Dominion, in the live economic area, and in the oight leading cities. The indexes of amployment in these tables have been converted from their 1926 baste average to June 1,1941 , as 100 , to facilitate comparison with the payroll indexee.

The grovth in employment and payrolls mown in thes tables in the period of observa\&10n, in most ares and many industries, is striking. Particularly marked is the oxpansion in the number of employees in the branches of manufacturing largely producing munitions of war, wuch as chomical, iron and steel, non-forrous metal and olectrical apparatus plants; in those the galas in the payrolls disbursed have been proportionately greater, as a result of overtime, vage adjustments, upgrading, otc. On the other hand, in 19 of the divisions ghown for the Dopinion in Table 8, the indexen of amplogmen were lower, mainly due to vartime ghortage of labour, together in some cases, with shortages of materials or commodities. Among these 19, hovever, only two reported smaller aggregate payrolls at Dec. 1, 1942, than at June 1. 1941; these vere the mining of non-metallic ores, and brokerage and stock merket operations.

## 

Table 11 contains the waekly per capita average earninge roported quarterly in the period, June 1, 1941 to Dec. 1, 1942. In most cases there hal beon a steady Fise in the veekly figure over the period, partly due to the payment of cost-of-1iving allowances, at mounting rates. Other factort were (1) the upgrading of employees as they acquired experience, (2) overtime. (3) the parment of highor rates in some inetancen.

In the case where the per capita figures howed declinel at any of the dates for which tatistics are given, these wore due in the main to holidays, or other seasonal causes. or to industrial disputes. Without exception, the averages at Doc. 1,1942 , vere higher than when the record was comenced at June 1, 1941, also exceeding those at Dec. 1, 1941. Thi: fact 1. particularly notovorthy in vien of the important degreo of labour dilution and of lahotr turnover in the 19 month of obserqation.

The highest weokly average in 1942 were raported in automobilo manufacturing, metallic oro mining. steam railway operation, shipbuiling and iron and eteal fabrication plante. The omployeen of these industries are predominatoly malo and much of the vork calle for a high degree of akill, while overtime is also an important factor. Among the classes with relatively lew carning are boot and tho manufacturing, eeveral of the textile divisions, logging and sorvices: except in logging, those industries roport large proportion of famale labour, which ordinarily implien many in the younger age groups. Another factor in all theo divielon is a high labour turnover. In considering the figures at the two extrsmes, it might porhaps bs woll to recall that in normal times, greater Btability of omployment ordinarily exista in the nondurible goode and in services, thas among many of the classes in which the everages are higher, a factor which, to some extent, may tend to compenate for the lover averages unvally found in the conmumer industrion.

In Chart 18 are doplesed the recent treade in the 1 dex mombere of wectry per oaply

1) If the coverage of railway maintenance of equipuentomplojees were the same in the Annual Consus as in the Monthiy Surveys, the per capita avorage earnings in 1941 in iron and steel would be $\$ 31.21$, and 10 all manufactures. $\$ 25.51$.

The value of the comparison of the two series is impalred by the fact that the current Etatistice are available only for the last seven monthe of 1941, during which emplovment rose very substantially as the year advanced, so that the level in the latter months was considerably above the average for the twelve monthb. Under the terms of P.C. 8253, the payment of cost-ofliving allowances to the great majority of the workers in the indurtries of whose employment there is current record, was made obligatory from the automn of 1941; in some cases, the bonus was increased in the later months and, also in some instances, the wage rates were ralsed. The upgrading of employees as they acquired experience, and the growing concentration of workere in the more highly-paid heavy industries, were also factors of importance, which considerably more than offeet the lowering influence of the large-scale dilution of labour in effect as the year progressed. Thus it is obvious that payrolls and average earnings generally in the second half of the year w11 have exceeded those disbursed in the earlier part of 1941, quite apart from the seasonal movemente which further experience with the current date will reverl in payrolls, as in employmant. It should be noted that, in general, there is probably a tendency for the firme comperating in the monthly survey to disburse a disproportionately large share of the aggregate payroll in manufacturing; this is partiz due to the fact that the smaller eatablishments excluded Irom the statistice belong mainly in the industrie: producing consumers goods, in which earnings srequently are relatively low.

In the current survess of employment and payrolls, considerable numbers of maintenance-pl-aquipent workers of the railways are included in the manufacturing division; the Censug of industry, hovever. restricte the coverage of rellway employees to those in the locomotive and

- Preliminary.
 staffi. If the Consus and the current susvoys had theluded tho reace categorios of railroad onployees and tholy parroile, ifs Congus weokly average of narninge in manufacturing as a whols. in 1941 would have bien $\$ 25.31$, rather than $\$ 25.31$.

In 1941, the coneral index of employmont in manufneturing at June 1, prectically coinclded with tha annual average, to which it was mach cloear than the index for any other moxth of the year. Sable VI ahow the per capita areragen indicated in the various indubtrial croups at Jume 1 , as well as the arorage of the monthly 11 gures in the period of obecration in 2943. In comparing the figures for Junc 1 with the Consus averagee for 1941, however, another factor ent ars into the aitumion - vis.. the fect that the obeorvance of the Victoria Day holiday in come cates affocted the earning disbureed on or about June 1. In some cases, and notably in the industice not so lmadiatoly engaged in war work, the aurninge at that dato ware lower thas unual. This may well bo the explasition of the fact that in the textile induetris3, the earninge reported at June 1 ware below the 1941 Cenous avorege. On the other hasd, whare work on Victoria Day was regarded as overtime, the reported wookly anminge would be hicher than in a woek which contelned no holiday. The June 2 ligusec may alno rolloct cortain seasonil tronde obscured in the ansual ficures; howser, the experience with the payroll itatiotice is too limited at present to allow any aesmement of the foportance of this factor.

Desplte the difference in the coverage in the various industrial croups, which 10 dealt W1th further on, there appeared in 1941 a atiefactory agreament in the figures of earninge ae propered in the dnnual Conmus and the curront nurvers; thon data are od dfferently complied thet comsidernble variation is wome casen mift not have boon surprining. Obviouely, some further time must elapas bofore the ifnal points of difforence and agreemont in the figures can be ovaluated and interproted. In the meantime, the result aro reasouring in segard to the ability of the current liguse eccurately to portray tho trpical oarnings and the acgrogate payrolle in manufecturing.

The dietribution of the employece in rocoriod amployment according to the annual Conous of Induetry and the ourrent exryeye of emplogmont and paypolle it given below. The aployese of thom there wee current record in 1941 conet1tnted 88.9 p.c. of the totel reported oy all entabliebment: comoperating in the anmumi Consue of Induetry, taling the f1gusoe ae thoy otand. Wham adfuetmont is made for the maintonance of equipment workere inciuded in the current returne, bat not in the aspual Conul atatistice, the proportion falle to 87 p.e.

 ourreat statlistion of amplograent and payroil.

The variation in the coverages in the differant industrial groups is due, in genaral, to the sise of the unit of production usual in the varinus industries making up the gromp. As a result of the wartime trend towards the concentration of production in the larger astabliahments, the currant survevs, (limited in the main to plants havinf a minimum of 15), included a greater proportion of all those amploved in manufacturing in 1941 than in anv earlier year. Even in the gromps with the smallest coverage, however, the sine of the sample is adequate to ensure a correspondence in the general movements indicated in the annual and the monthly data. It is probable that the coverage will have shown a further increase during 1942 with the intenbification of the industrial war effort.

## 16. - CHANGRS IN TARNINGS DURING THE PERIOD OF THE WAR.

The money earnings of workers in all parts of the world have undoubtediy shown important advances during the war; in many cases the increase in wagas and earnings generally have been offset by ribing costs of living, whils large increases in taxation have also been universal. The statistics available in the various countries are not sufficiently similar to peralt any dotailed comparisons of the wartime trends of earnings; however, the general moverents affecting large number of workers in the United Kingdom, the United States and Canada, are briefly dealt with in this section.

Tho Trends in Great Britain. - According to the Docember, 1942, issue of the British Ministry of Labour Gazette. the average eamings of some $6 \frac{t}{4}$ railinon wage-earners in a large number of industrial groups in the United Kingdom had risen by 59.9 p.c. from October, 1938, to July, 1942. From July, 1941, to Julv, 1942, the gain amonted to 12.3 p.c. The indinstries surveved in the Ministry of Labour's onquiry included certain non-manufacturing classes, as well as manufacturing establishments, but the latter appeared to prodominate in the survey, which covered wageearners only, oxcluding offic staffa. In the Dominion, the sise in the weekly por capita average carnings from July 1, 1941, to July 1, 1942, smointed in manufacturing to $12.9 \mathrm{p} . \mathrm{c} .$, while in the combined manulacturing and non-manufacturing industries, the gain was 11.8 p.c. These figuros approximate quito closely to the incranse of $12.3 \mathrm{p} . \mathrm{c}$. In the same period in the Unitnd Xingdom.

The Trend in the United States. - The Arnerican Bureau of Labor Statistics has for many yeara prepared current statistics of average weekly esmings in manufacturing. Changes recently made in the method of compliling these data, however, prohibit comparisons over a perlod of any longth; the earliest information I/ avallable at the date of writing refers to Nov. 15, 1941, when the par capita average was $\$ 30.93$. Twelve months later, this figure had risen by $28.6 \mathrm{p} . \mathrm{c}$. . while the Doc. 15, 1942, average of $\$ 40.27$,was $30.2 \mathrm{p} . \mathrm{c}$. higher than at Nov. 1, 1941. From that dat. to Nov. 1. 1942, the Canadian per capita average in manufacturing had advancnd by 11. 5 p.c. and to Dec. 1, hy 13.2 p.c. It is ovident from these very rough comparisons that recent increases in the United States have greatly exceeded those in either Canada or Great Britain.

The Trend in Canada. - There are no data compiled elsewhere in the Dominion againet Which the recently-instituted monthly statistics of payrolls for practically all classes of industrial amployment may be measured to show the changes which bave taken place from the outbreak of war. The information obtained in the Annual Census of Industry provides a good basis of comparison for the large group of manufacturing industries, 2/ despite important differences in the coverage which, as already explained, undoubtedly affect the statistics of earnings to a greater or leseer extent. In general, the exclusion of the mealler firm (most of whom belong in the relatively lower-paid consumer industries) should tend to produce a rather higher per capita average of earning in the case of the statistics cinrrentliv collected. However, until information that is wholly comparable in point of time is available, it is difficult to assess the importance of this factor. It therefore follow that at present the comperison can be used only to indicate in a gereral way. the movements of earnings in the manrifacturing classes. On the whole, the allindustries' trends must be fairly similar to those in manufacturing, any differencos axisting in the general figure belng more in degree than in direction.

[^4]The annual Cenaus of Industry shows that the wenkly oarning in manufacturing, conputed by dividing the annual mvroll by 52, avaraged $\$ 25.31$ in 1941 ; undoubtedly earning in the latter part of the voar averaged considerably hifher than in the earlier months, with the progreselve develoment of industrini nctivity and the increasingly wider application of the sybtem of paving cost-of-living allowances, which hacam mandatory in almost all industrien under P.C. 8253 of October 24. 1941. The fact that the weokly per capita average, hased on the currentlycollected f1gures, was $\$ 25.53$ at June 1,1941 , whis the annual average was $\$ 26.49$, Implise a generally high degrec of comparability with the 1941 Censug average of $\$ 25.31$. It accordingly seens fair enough to assume that weokly earnings in manufacturing, which increassd by 19.7 p.c. from $\$ 21.14$ in 1938 , to $\$ 25.31$ in 1941 , showed a further considerable gain in 1942, bringing the average (calculated from the not wholly comparable monthly figures), to a point approximatoly 38 p.c. higher than in 1938. As stated above, the grin from July 1. 1941, to Julv 1, 1942, was 12.1 p.c., while that from Nov. 1. 1941. to Nov. 1, 1942, was 11.5 p.c.

Tho data for the United Kingdom, the United States and the Dominion are not wholly comparable; the Canadian all-industries and the British figure appear fairly comparabio in coverage, whil. the Canadian and Agerican general averages in manufacturing are practically the same in this respect. The Dominion statistics, however, tak in certain clases of vorkers excluded from both British and American flgures. In spito of these differences, and disregarding that in the daten of the enquirios, (which so far as the Canadian ilgures are concernod, makes relatively little difference in the percentages of increase), the ifgures as sumarised belov may be used in a general way to provide a comparison of the recont movemente of carnings in the different countries.

The data indicate consicerable similarity in the Canadian and British trends, particularly in the twolve monthe' comparison. In the Jaited States, $1 /$ howevar, the rise in carnings in manufacturing has bean on a substantially greater scale in the brief period of observation than in either the United Kingdom or Canada; this is no doubt partly due to the fact that the American participation in the war as a belligerent, dates only from December, 1941, Ance when there has been a vast expansion in industrial activity. Another important factor is that, until recnatly, the regulation of wages has beon less drastic in the United States than in oither the United Xingdom or the Dominion.
